Other conspicuous monuments are the statue of the republic in the Place de la République, and the equestrian statues of Louis XIV in the Place de la Victoire, of Etienne Marcel at the Hotel de Ville, of Washington in the Place d'Iéna, of Joan of Arc—two, one opposite the Church of Saint Augustin and the other in the Place de Rivoli—and of Charlemagne in the Parvis de Notre Dame. The monuments of Gambetta at the Louvre, of Danton in the boulevard Saint Germain, of Molière in the rue Richelieu, of Shakespeare in the boulevard Haussmann, of Marshal Ney near the Observatoire, of La Fontaine in Passy, of Dante at the College de France, of Voltaire on the quai at the Institute, are among the many fine monuments that adorn the city. There are in all according to a recent official report 188 statues of men and women and 3,758 public clocks in Paris. If the statues of men and women in the parks and cemeteries are included, the total is more than 250. One monument of particular interest to Americans is the reduced copy of Bartholdi's "Liberty Enlightening the World" in bronze,

on the Pont de Grenelle, presented to the city by the American colony in Paris, which has carved on its base simply the two great republican dates, "1776-1789."

Theatres and the Opera.—The leading theatre of France is the Théâtre Français—"the house of Molière," as Frenchmen affectionately call it. It was founded in 1600 at the hotel de Bourgogne in the Marais, and was under the superintendence of Molière from 1658 down to his death in 1673. The present house in the rue Richelieu, adjacent to the Palais Royal, was built in 1782, after his death. The interior was destroyed by fire in 1900, but it was immediately restored and rebuilt (1,400 seats). It contains a valuable theatrical library, and many theatrical art treasures, notable among which is Houdon's famous statue of Voltaire in the foyer. This great theatre—perhaps the first playhouse in the world, in virtue of its history and what it has contributed to dramatic art in its three hundred and more years of existence—was given its present pre-eminence in 1680, when Louis XIV suppressed its rival, the theatre of the Marais, and consolidated the troupe of Molière which then still played at the hotel de Bourgogne, with the Theatre Guénégaud in the rue Mazarine, thus creating a single theatre for Paris and eliminating all competition. This became what is now the Théâtre Français, and has had a continued existence from that day to this. It was for a time at the end of the 17th century on the other side of the river near the Institute, where the rue de l'Ancienne Comédie still suggests its former establishment on the left bank. The Théâtre Français—sometimes also called La Comédie Française—stands, however, second in official priority to the Grand Opéra, which is now the first play house in Paris. The opera house, a sumptuous edifice, bearing the inscription, "*Académie Nationale de Musique*," standing at the head of the avenue de l'Opéra, was commenced in 1861 and completed in 1874. It occupies a site prepared especially for it just off the grand boulevard, covering an area of nearly three acres. Although it is much the largest theatre building in the world, it is third among the great theatres in point of seating capacity, coming after La Scala at Milan and San Carlo at Naples. It seats 2,200 persons. The site alone cost more than \$2,000,000, and the building about 60,000,000 francs. It has an annual subvention from the government of 800,000 francs. No description can adequately convey a proper notion of the magnificence of the building and of its lavish decoration. The Opéra Comique, dating from 1761, which was destroyed by fire in 1887, has been splendidly rebuilt (1,500 seats), and stands next to the Grand Opéra in the amount of its subvention. It receives 300,000 francs annually from the government. The Odéon (1,420 seats), dating from 1782, on the left bank, near the Luxembourg, ranks in some respects next to the Théâtre Français, and is devoted chiefly to the performance of classical dramas. It is par excellence the theatre of the Latin quarter. The four theatres just mentioned are the subventioned theatres, each receiving from the state a substantial annual subscription. They are consequently open the year round, except for a short time in midsummer. The Grand Opéra and the Odéon give gratuitous

performances two or three times a year, in recognition of their public character. Other leading theatres are the Châtelet (3,400 seats), the largest theatre in Paris, dating from 1780, and devoted now mainly to spectacular plays, for which its large stage especially adapts it; the Gaite (2,000 seats), dating from 1753, which affects light opera; the Vaudeville (1,100 seats), dating from 1792, a handsome theatre in the boulevard des Capucines, the character of which is fairly indicated by its name; the Théâtre Sarah Bernhardt (1,699 seats) in the Place du Châtelet, conducted by Madame Bernhardt; the Folies Dramatiques (1,600 seats), dating from 1831; the Antoine (1,000 seats), a new theatre that is attracting a good class of patronage by the uniformly high character of its productions; the Ambigu-Comique (1,500 seats), dating from 1769; and the Palais Royal (850 seats), an attractive little theatre dating from 1789, are each of them well-known places of amusement. There are in all in Paris about 40 theatres of the first class, besides a great number of secondary playhouses. Such institutions as the Moulin-Rouge, the Folies-Bergère, the Casino de Paris, the Olympia, the Concerts Rouge, the Concerts Colonne, the Nouveau Cirque, the Ambassadeurs and the Jardin de Paris have a world-wide reputation, while places like the Bal Bullier, the Bal Tabarin, the Palais de Glace, the Hippodrome, and all the rest of the cafés-concerts and cabarets artistiques *et id omne genus*, are not less known and appreciated by *Paris qui s'amuse*.

The Restaurants, Hotels and Street Life.

—Paris is the home of high culinary art, and many of the famous restaurants, such as the Maison Dorée (like Torton, Hardy, the Café Anglais and Durand, now only a memory), Paillard, Café de Paris, Café de la Paix, the Ritz, Voisin, Ciro, Marguery, Foyot, Tour d'Argent (dating from 1582, and thus possibly the oldest of restaurants), and des Ambassadeurs have a world-wide reputation among *bon vivants*. Paris is also the city par excellence of hotels. No city has so many of them. The tendency is to small hotels, many of which maintain the highest standards of culinary excellence, and cater for a very critical clientèle. Nowhere does one take his ease at his inn more perfectly—nowhere is he more absolutely *chez lui*—than in one of the countless little hotels of Paris. Among the great hotels, the Grand with its 1,000 rooms and superb location at the Place de l'Opéra, is pre-eminent. Other large hotels of the first class are the Ritz and the Bristol in the Place Vendôme, the Elysée Palace in the avenue des Champs Elysées, the Continental in the rue de Rivoli facing the gardens of the Tuileries, the Terminus at the Gare Saint Lazare, the Regina, the Meurice, the Astoria, the Carleton, the Grand Hotel du Louvre near the Palais Royal, the Moderne in the Place de la République, the Scribe and the Mercedes at the Place de l'Etoile. Scarcely anything more impresses the visitor to Paris than the brightness and brilliance of the streets. They are kept scrupulously clean, and the wide asphalt sidewalks give opportunity for a life in the streets that is particularly pleasing. The cafés and restaurants set little tables in two or three rows on the sidewalks in front of their establishments under awnings, at which at almost all seasons of the year many thousands of per-

sons daily are entertained either for their meals or for the aperitif which all Parisians seem to take in the late afternoon. Whenever the weather is mild these seats and tables in the streets are occupied by a well-ordered throng until well after midnight, eating, drinking, smoking, reading, writing, chatting and hearing the music. In consequence of this fashion of outdoor life the streets of Paris are especially brilliant. The plan and arrangement of the streets throughout the city, their width and the careful regulation of the traffic, facilitate easy and rapid transit, and consequently—in spite of the density of the traffic—they seldom seem exceptionally crowded. There is almost never a "block" in the movement of vehicles in the streets, although through the grand boulevard and at certain corners elsewhere the traffic is much the densest in the world.

The Markets and Abattoirs.—The central markets, the cattle markets, the wine markets and the abattoirs, which supply Paris with food and drink, furnish some interesting statistics. The markets (*Halles Centrales*), of which the name and the location date from the foundation by Philippe Auguste in the 13th century, are vast structures, chiefly of iron, erected in 1874, consisting of 12 pavilions, between which run covered streets, 48 feet wide and 48 feet high, intersected by a boulevard 105 feet wide. The six pavilions on either side of the boulevard occupy a space of 182 by 136 yards, the whole market covering an area of 22 acres. Each pavilion contains 250 stalls, and under each of the pavilions are cellars of similar area. It is estimated that 15,000 vehicles are employed in and about the markets in the traffic incident to the business. In spite of their extent they have become quite inadequate and the municipal council has now in hand a project for enlarging them by condemning the property to the east as far as the boulevard de Sébastopol, consisting of four blocks, for the erection of an extension. In each arrondissement, there are, in addition to these central markets, one or more local markets of the same general character, under municipal control. The cattle market (*Marché de la Villette*), near the fortifications on the rue d'Allemagne, consists of three large pavilions, covering an area of 10 acres. The central hall is capable of containing 4,600 oxen, the one on the right about 7,000 calves and pigs and the one on the left 22,000 sheep. About 4,000,000 head of cattle annually enter the market. Nearby and adjoining the cattle market are the slaughter-houses (*Abattoirs de la Villette*), the buildings of which include 20 courts with 250 scalding-pans. Both the markets and the slaughter-houses, which are kept exceedingly clean, are open at all times to the public. The cattle market and the abattoirs together have cost the city upward of 60,000,000 francs and well repay a visit.

Underground Paris.—The most distinctive feature of Paris underground are the sewers, which have for centuries been among the wonders of the capital. There were no covered sewers or drains in Paris prior to the reign of Louis XIII. Theretofore, there had been only open drains or gutters in the middle of the streets, such as may still be seen in some of the oldest streets of the French quarter in New Orleans, but about 1630 the present system was undertaken. It progressed at first but slowly, and

only since about 1854 has it been efficient and relatively complete. It consists of an elaborate network of drains covering the entire area within the walls, constructed of stone and concrete in the most substantial manner, divided into 15 classes, from the great sewers of the first class, which are 18 feet and 2 inches in height by 11 feet and 4 inches wide, down to the little drains a few inches in diameter, that connect each individual house with the street drain. The discharge is carried by a tunnel far down the river below the city, where the liquid portion escapes into the river at Asnières, while the solid parts are collected and utilized as fertilizer in the peninsula of Gennevilliers. The city is divided, for drainage purposes, into four parts, by the two main sewers which run at right angles to the river under the boulevard de Sébastopol and the boulevard Saint Michel, respectively. These are discharged, not into the river, but into eight channels parallel with it, which in their turn receive the contents of 15 tributaries fed by numerous smaller drains. The total length of the network is in excess of 900 miles, a distance about equal to that from New York to Chicago, or a railway journey of 24 hours by fast express trains, and the system as a whole is without an equal anywhere. The cleaning of the sewers is effected by boats and scrapers and there is a siphon system at the Pont de l'Alma for conducting the drainage under the Seine. Excursions are made by curious visitors through some of the main sewers in electric boats and tram cars, which start periodically either from a point near the Madeleine or the Louvre, and go a distance of about five miles to the exit near the church of Saint Laurent in the rue Saint Martin or to the Place du Chatelet, or vice-versa. The sewers are utilized not only for sewage and drainage, but also as conduits for the water and gas pipes, for the pneumatic tubes that are used by the post office for the transmission of mail matter and for telephone and telegraph wires; they are perfectly ventilated and constantly patrolled by the men in charge of the service.

Below the sewers on the left bank are the Catacombs. They are the remains of ancient quarries, worked as far back as the Roman period, for the limestone of which Paris is built. They extend under a considerable part of the left bank. They were first used during the Revolution as depositories for bones and dead bodies removed from the cemetery of the Innocents, which was closed at that time. They have, therefore, been charnel-houses and known as catacombs only from that period. They are open to visitors periodically, the entrance being at the Place Denfert-Rochereau. They are extensive and rather curious, but very far from possessing the interest of the more famous catacombs of Rome, Naples and Syracuse.

The latest and most presently and practically important feature of underground Paris to the average man is the Metropolitan Underground Railway, which was opened in 1900. It consists of lines running in various directions throughout the city, especially of a main line through the centre of town east and west, from the Porte de Vincennes to the Porte Maillot, a distance of about seven miles, and another more northerly line from the Place de la Nation to the Bois de Boulogne, making a loop of about eight miles in length. There are many

connecting branches touching the Place de l'Opéra and the railway stations, which bring the lines to practically every part of Paris. The fares are five cents first class and three cents second class for any distance. Automobile omnibuses, carrying 30 passengers and weighing but 5,600 kilos, are run in connection with the Metropolitan, constituting the lesser arteries of the system of intramural transit, of which the lines underground constitute the main arteries; the omnibus fare is by distance and varies from two cents second class for a short distance, to five cents for a first class for any distance. The 663 omnibuses (employing 10,700 horses), of which 418 were two-horse and 245 three-horse conveyances, have thus been superseded.

No description of Paris underground would be quite complete without mention of the new and splendid station of the Orleans Railway line on the Quai d'Orsay, and the tunnel that runs under the quais and next to the river connecting it with the main station, two miles distant, at the Quai d'Austerlitz. It is regarded as an almost perfect installation, and served as a model for the similar work in New York by the Pennsylvania Railroad Company. The canals which traverse Paris, some of them underground for long distances, for example, under the Place de la Bastille and through the boulevard Richard Lenoir, are interesting displays of engineering and building skill.

Bibliography.—Among the immense number of books, historical and illustrative, concerning Paris, the following, mainly French and American works, will be found especially valuable: care should generally be taken not to rely much on information from distinctively English sources—'Paris à travers les âges' (1875); Robida, 'Paris à travers l'histoire'; Joanne, 'Paris illustre' (1881); Labedollière, 'Le Nouveau Paris' (1871); 'Guide de Paris par les principaux Ecrivains et Artistes de la France' (1868); Martin, 'The Stones of Paris' (1899); Haynie, 'Paris Past and Present' (1902); Lansdale, 'Paris, Its Sites, Monuments, and History' (1899—an accurate and very readable work); Bayet, 'Précis d'Histoire de l'Art'; Robinson, 'Modern Civic Art' (1903); 'Guide Pratique à travers le vieux Paris' (1903); 'Memorable Paris Houses' (1888); 'Paris and Its Story' (1904); Belloc, Hilaire, 'Paris' (1904); Moriac, 'Paris sous la Commune' (1871); Kaufmann, 'Paris of Today' (1891); Bourdon, 'Petite Histoire de Paris'; Hugo, Victor, 'Paris', 'Les Misérables' and 'Notre Dame de Paris'; Sue, Eugène, 'Mysteries of Paris; the 'Opera of Louise'; Lacombe, 'Bibliographie de Paris' (1886); Wolff, Jetta S., 'The Story of the Paris Churches' (Oxford 1918). The Guides of Joanne to Paris and its environs (in French and English) are mines of accurate information.

CHARLES F. BEACH,
American Lawyer in Paris.

PARIS, Canada, a town and port of entry of Brant County, Ontario, on Grand River, on the Grand Trunk Railway, the Lake Erie and Northern Railway, and the Canadian Pacific Railway. It is connected with Brantford (7 miles) and Galt (14 miles) by the Grand Valley Electric Railway. The town has seven churches, three public schools and a high school, a public

library and three banks. It owns its lighting and water-supply systems; and is supplied for industrial purposes with natural gas, and electric power from Niagara Falls. It is a busy industrial centre with potteries, plaster mills, knitting mills, flour and cloth mills and oil refineries. It has a refrigerating plant, and makes needles and shells for munition works. In the neighborhood are extensive gypsum beds and brick clay. Pop. (1921) 4,365.

PARIS, Ill., city, county-seat of Edgar County, on the Vandalia Line and the Cleveland, Cincinnati, Chicago and Saint Louis railroads; about 18 miles northwest of Terre Haute, Ind., and 110 miles east by south of Springfield. It was founded in 1825 and incorporated in 1849. It is in a productive farming section, in which wheat, corn and broom corn are cultivated extensively. The manufacture of brooms is a prominent industry. The streets are well kept and the city presents the appearance of fine homes of prosperous people. There are a children's home and a public library. The park has an area of 100 acres, about 70 of which is an artificial lake. In 1916 the commission form of government was adopted. The electric-light plant and waterworks are owned and operated by the city. Pop. 7,985.

PARIS, Ky., city, county-seat of Bourbon County, on a branch of the Licking River and on the Louisville and Nashville and Frankfort and Cincinnati railroads, about 20 miles northeast of Lexington. It was settled in 1784 and in 1862 was chartered as a city. It is in an agricultural section, in the "blue grass region." The chief trade is in tobacco, grass seed, poultry, hemp and horses. The prominent public buildings are the courthouse, built in 1903, and the municipal buildings. There are public and parish schools and a library. The city owns the gas-plant. Pop. (1920) 6,310.

PARIS, or PARIS HILL, Me., village and county-seat of Oxford County, about 50 miles northeast of Portland. It is situated at an elevation of 800 feet and has fine scenery. Nearby is Mount Mica, which is notable for the variety of its deposits of rare minerals, including beryl and tourmaline. Novelties in wood are manufactured here. Pop., township, 3,436.

PARIS, Tenn., city, county-seat of Henry County, on a branch of the West Sandy River, and on the Nashville, Chattanooga and Saint Louis, and the Louisville and Nashville railways, about 119 miles west of Nashville. It is in a fertile agricultural region, in which cotton and tobacco are the chief products, and has an extensive trade in grain, cotton, several kinds of tobacco and proprietary medicines. There are flour and lumber mills, and railroad repair shops in the town. Pop. over 4,730.

PARIS, Tex., city and county-seat of Lamar County, on the Texas and Pacific, the Saint Louis and San Francisco, the Gulf, Colorado and Santa Fé, and the Texas Midland railways. The town was founded in 1845. Its affairs are managed under a special charter, by a mayor and board of aldermen. The city has a well-equipped fire department and it owns the waterworks and sewerage system, the latter being on the Waring system and the sewage being disposed of on a sewerage farm. The Federal government has a fine courthouse and post-

office building, and the county courthouse is an imposing granite structure. There are two telephone systems, an electric railway, and electric light and gas. The homes and business houses are nearly all owned by their occupants, and very little of the property is mortgaged. The city has a high school affiliated with the State University as one of its preparatory schools, and a private seminary for girls. The county and city jointly maintain a free hospital and the county poor farm. The electric railway maintains a park and summer theatre in the eastern suburbs. The lands surrounding Paris produce cotton, corn, oats, alfalfa, fruits and vegetables; while the industrial establishments comprise cottonseed-oil mills, flour mills, an iron foundry, candy factories, woodworking shops and mattress and broom factories. Pop. (1920) 15,040.

PARIS BASIN, an oblong depression about 20,000 square miles in extent, in the Cretaceous rocks under and around Paris, filled in with richly fossiliferous Tertiary deposits. It was made famous by the palæontological investigations of Cuvier.

PARIS GREEN, a poisonous pigment, a vivid light green in color, extensively used to kill the potato-bug and the cotton-worm. It is an insoluble mixture of the double salts of the acetate and the arsenite of copper, and was at one time extensively used as a pigment, especially for wall paper.

PARISH (Low Latin, *parochia*), in ecclesiastical law, in England, a certain territory or "circuit of ground," committed to the spiritual charge of one ecclesiastic having care of souls therein. The whole of England is divided into 10,000 parishes. Camden says that this division was made in England about the year 630. Others refer it to a decree of the council of Lateran held in 1179. A law of King Edgar, about 970, seems to confine the payment of tithes to the parish to which a person belonged; and so it has remained ever since, and nowadays a man's parish in England is that in which the poor rate is collected from him. In the United States the word parish does not mean the same thing as in England, nor does it mean the same thing in all the States. The legal importance of parishes in England depends upon the fact that the rector of each parish is entitled to certain dues collected within it. From the first settlement of the United States there have been everywhere associations and bodies corporate or organized for ecclesiastical purposes, and these have been generally called parishes. In New England they were originally the same as towns; that is, the persons composing a town, and acting as a town in civil and political matters, also acted as one body in religious or ecclesiastical matters; and the parish had therefore the same territorial limits as the town. Afterward, as the towns grew more populous, they were divided for ecclesiastical purposes into different parishes, which were still territorial and were contained within local limits. There are many such par-

ishes now in most of the States. At length, however, as a diversity of religious sentiment became developed, all religious opinions standing on the same footing in law, parishes began to be formed of persons associated by similarity of religious sentiment and not mere nearness of residence, and therefore with little or no reference to their place of abode. These were called poll parishes, in distinction from territorial parishes. They are numerous everywhere, and in the large cities may be considered as having taken the place of territorial parishes, which are almost unknown there. In Louisiana, the word parish is used to designate a district separated and defined by local limitations for merely civil and political purposes.

PARISH REGISTER, The, by George Crabbe, is the most notable poem of the volume published by him in 1807, 22 years after the appearance of the last of the early group of his poems. In some respects, for example, in the use of heroic couplets and of conventional diction, as well as in the absence of the more charming and inspiring elements of poetry, it held by his earlier work, but it was marked by a comparatively new and extraordinarily effective power to paint with resolute realism the lives and characters of the humbler inhabitants of an English village. Though in verse, it was really a valuable contribution, at an important juncture, to English fiction, despite the somewhat mechanical fashion in which the simple tales and sketches were grouped under the heads of 'Baptisms,' 'Marriages' and 'Burials.' With its flattering success Crabbe "found himself," and he followed the thus revealed line of his genius — not without showing development — in such works as 'The Borough' (1810) and 'Tales of the Hall' (1819). Each of these has its partisans who would place their favorite above 'The Parish Register,' but that seems sufficiently to reveal the essential Crabbe, and it has the advantage of being comparatively short. Hence for the reader who does not wish to remain unacquainted with the poet whom Byron — surely with 'The Parish Register' in mind — considered to be

"Though Nature's sternest painter, yet the best,"

there can be little doubt that the earlier work, which cheered the deathbed of Fox, may be the more safely recommended, although in it Crabbe does not reach the height of his power as a painter of the landscape of the eastern coast or exhibit strikingly those qualities of mellowness that seem to have made 'Tales of the Hall' delightful to Edward Fitzgerald.

Upon the special excellencies of the poem there is little room, or need, to dwell. The introduction is admirable, especially in its pictures of the interiors of typical cottages. Of the tales, that dealing with the miller's daughter thrust out by her father, though conventional, is pathetic, yet not in such a moving fashion as the story of Phoebe Dawson, which particularly impressed Fox and in some memorable lines of description is perhaps inferior to no passage in Crabbe's later books. His humor, never his strong point, is seen in the Gardener who delights to give botanical names to his children and to impress his friends with his learning. Of the character sketches it is not rash to praise those of Andrew Collett, "the

blind, fat landlord of the Old Crown Inn," the thrifty Widow Goe, the trinket-loving Catherine, and the "noble peasant," Isaac Ashford. Yet some may hold that Crabbe reaches the height of his power at the very close, where he makes old Dibble, the parish clerk, describe the rectors under whom he had served. For those who think Crabbe's conversations such as were never heard on earth, who are not interested in Sir Edward Archer, the "amorous knight" and the recalcitrant Fanny Price, "lovely and chaste," who object to stilted lines, the admirer of 'The Parish Register can afford little help, but he may confidently assure them that the poem will never lack admirers.

WILLIAM P. TRENT.

PARISH SCHOOL. See SCHOOL.

PARISH SCHOOLS, Roman Catholic.

A free school attached to a Roman Catholic parochial foundation in order to carry out the belief of the Roman Catholic Church that there should be a union of secular learning and religious training for a complete education. Experience having shown that the instruction received at home and at church is not adequate for the requisite religious training of the child, the parish school, wherein religious, moral and secular training shall be imparted, was instituted. Such schools have been in existence from the earliest ages, although the special form in which we know them at the present day has been a development of the 19th century.

The new Code of Canon Law, promulgated by Pope Benedict XV as the universal law of the Church, on 28 June 1917, clearly outlines the Catholic position on the education question

as can be seen from the wording of the following Canons:

"1113. Parents are bound by a most serious obligation to procure as far as possible the religious, moral, physical and civil education of their children and to provide also for their temporal welfare.

"1372. 1. All the Faithful are to be brought up from childhood in such a way that not only nothing be taught them that is opposed to the Catholic religion and good morals, but so that religious and moral instruction hold the first place.

"2. Not only parents but all who hold their place have the right and most serious duty to procure the Christian education of their children.

"1373. Religious instruction must be given in the elementary schools, suitably to the age of the pupils.

"1374. Catholic children must not attend non-Catholic, undenominational, or mixed schools, those namely that are also open to non-Catholics. It belongs exclusively to the Bishop of the locality to judge under what circumstances and with what precautions against the danger of perversion, attendance at these schools may be tolerated.

"1375. The Church has the right to found not only elementary schools, but also secondary schools and schools for higher studies.

"1379. If Catholic elementary and secondary schools do not exist, in accordance with Canon 1373, care must be taken, particularly by the Bishop of the place, that they be founded."

The parish school does not materially differ in method, organization or scope from the public schools under the direction of the civil authorities, except that it is controlled by the Roman Catholic diocesan officials and supported by the voluntary contributions of the Roman Catholic people, receiving no State aid.

Organization.—The schools are graded according to the customary primary, grammar and high school divisions of modern educational ideas. The teachers are mainly members of the religious orders instituted for the work of education, supplemented by lay assistants. The rector of the parish is the official director of

† Including academies.

each school. There is a diocesan school board appointed by the bishop to look after the general welfare of the diocesan school system, and a special diocesan superintendent, a priest, who is charged with the immediate inspection of the schools and who is responsible for the progress and efficiency of the classes.

The course of studies is prescribed by the diocesan board, which also controls the teaching staff. In some dioceses these teachers hold State licenses to teach, or they must pass an examination equal to the requirements for such a license. In many schools in New York State the Regents' examinations are taken. Lay trustees have been appointed on some of the school boards, but this custom has not become general as yet. Normal schools for members of the teaching orders, training classes and all the formal details for the study of pedagogy have been instituted. A Catholic Educational Association was organized 14 July 1904, which holds an annual National Conference attended by delegates from all over the country, the deliberations of which have done much to standardize the parish system of education, under the 40,000 teachers in the Catholic elementary and secondary schools. These teachers are drawn mainly from 85 distinct communities of the religious orders of men and women, of which about one-fifteenth are men. The elementary schools are almost entirely taught by women. The upkeep of these schools costs the Catholics of the United States they estimate about \$12,000,000 a year. This does not include the original cost of the buildings or sites. All this is in addition to the ordinary taxes for State schools.

With the growth of the general educational impulse and the development of the public school system there was an insistence by the Roman Catholic Church authorities on an equal impetus for the free parochial school. It must be remembered always that this opposition was not against the public school *per se*, but against the system that divorces religion from education or the "national endowment of agnosticism" as it has been termed. In 1904 the official report showed 4,001 schools and 986,088 children in attendance. In 1910 the figures were 4,703 schools and 1,197,913 pupils. For official figures prepared by the authorities of each diocese for the Catholic Directory giving the standing of Catholic parish schools in the United States, March 1918, see table p. 321.

History.—Roman Catholic schools have existed in the United States from the earliest days of missionary effort. As early as 1598 they were in use in New Mexico and Florida and for English-speaking pupils in Maryland in 1636. As the church membership grew in numbers and influence after the Revolution the movement for the establishment of elementary schools took on new vigor. It can be traced best in the formal legislation of the church authorities on the subject. The first Provincial Council of the bishops of the United States, held at Baltimore, Md., in October 1829, expressed the wish that schools should be organized where youth may imbibe principles of faith and morality along with human knowledge. In the three Plenary, or National, councils of the American hierarchy held also in Baltimore, the first in 1852; the second in 1866 and the third in 1884,

the legislation is specific on the subject. What was an exhortation in the first and a prayer in the second became a command, emphatic and imperative in the third. In the First Plenary Council the bishops were exhorted, in view of the evils which arose from the defective education of the youth, to have a school attached to every church in each diocese; and to provide for the same and for suitable teachers from the revenues of the parish. In the Second Plenary Council the decrees laid down that the first, and in fact the only, remedy for the terrible evils of religious indifference and of moral corruption would seem to be that in every diocese, each church should have its school in which the Roman Catholic youth should be trained in religion and good morals as well as in literature and the arts. In the Third Plenary Council, it was decreed that:

"I. Wherever a parish school does not already exist, one must be built within two years from the promulgation of the decree, and maintained in perpetuity, unless the bishop on account of insuperable obstacles, consents to a delay."

"II. Any priest, who, by culpable negligence, fails to erect and to maintain a school within that time, or who will not heed the repeated admonitions of the bishop, will be liable to removal from his church."

"III. Any mission or parish which fails to assist the priest in erecting and maintaining a school to such an extent that owing to this negligence the school cannot exist, must be censured by the bishop, who will employ efficient and prudent means of obtaining the necessary support."

"IV. All Catholic parents are obliged to send their children to parish schools, unless they provide for their Christian education either at home or in other Catholic schools, or else obtain permission for sufficient reason, approved by the bishop, and with due precaution and other remedies, to send their children to other schools. What constitutes a Catholic school is left to the judgment of the bishop."

Other laws to give force to these decrees enact that candidates for the priesthood during their seminary course shall receive special training with a view to the proper management of schools. Bishops are required to appoint a commission for the examination of all persons who shall apply for positions as teachers in the parish schools and to see that the schools be brought to that "state of efficiency and perfection which the honor of the Church, the interests of the pupil, temporal as well as eternal, and the generous loyalty of the laity, unquestionably demand and deserve." The end to be kept in view is "that the parish schools may continue to grow stronger and more efficient and may prove to be a source of pride, of hope and of strength to the State no less than to the Church."

As a consequence of this legislation parish schools are to be found in every centre throughout the land where the Roman Catholic congregation is numerous enough to support one.

The first schools in the United States were usually established under the auspices of some religious denomination. The first free parish school in New York was started by Saint Peter's parish, New York city, in March 1800. It is the oldest free school in the city, the first public school not having opened until May 1806. By subsequent act of the legislature, passed in 1806, Saint Peter's school was empowered to receive its due proportion of the taxes collected by the State for educational purposes. In the United States Catholic Directory 1845-49 it is stated, "There are common schools for both male and female children in most of the cities and towns of this diocese (Boston) having Catholic teachers. In Lowell they are supported

at the public expense, but in all other places at the expense of the parents of the children, aided by collections in the churches." Lowell was a centre that had attracted a large Irish Catholic population and at the annual town meeting in May 1830 a committee was named to consider the expediency of establishing a separate school for the benefit of this part of the population. This committee reported favorably on such a school in April 1831. Bishop Fenwick writing to Lowell from Boston 26 March 1831, said:

"I see no impropriety in the Catholic school of your town receiving aid from the school fund, especially if the Catholics of Lowell have contributed their portion by the payment of taxes or otherwise toward the support of said fund. Common justice would entitle them to something out of it for the payment of their Master. But I really do not understand how, in this liberal country, it can be made a condition to their receiving anything that they, the Catholics, shall be in that case debarred from having a Catholic teacher, learning out of Catholic books and being taught the catechism of the Catholic Church. We can never accept such terms. I would not give a straw for that species of education which is not accompanied with and based upon religion."

Under an arrangement then made with the Catholic pastor of Lowell, several schools were organized which were paid for out of the public taxes. They are spoken of in the State Board's report of 1851 as the outcome of a "wise and liberal policy," but they lapsed after 16 years of trial with the rise of the Native American movement and its consequent religious disturbances. The first Roman Catholic school in Boston was opened in 1820 and taught by Ursuline nuns. The Rev. John Thayer collected money in Ireland to have the project carried out.

In New York City in 1841 the school question played an important part in the State election. The school funds in the city were then administered by a body known as the Public School Society. The Roman Catholics complained of unjust treatment at its hands and the agitation by them with Bishop Hughes at their head resulted in the formation of the present public school system of the city and the entire abolition of the old Public School Society. In his message to the legislature on 4 Jan. 1842, Governor Seward, presenting the subject of schools and the school fund to the legislature, favored the consideration of the denominational free schools in the distribution of the taxes for educational purposes. In this he followed the teachings of his old preceptor, the famous Rev. Dr. Eliphalet Nott, president of Union College, who was asked by the governor to give him his views in writing on the subject that he might embody them in a message to the legislature. This he did and Governor Seward, in his message to the legislature 1 Jan. 1840, says:

"The children of foreigners found in great numbers in our populous city and towns and in the vicinity of our public works are too often deprived of the advantages of our system of public education in consequence of prejudices arising from difference of language or religion. It ought never to be forgotten that the public welfare is as deeply concerned in their education as in that of our own children. I do not hesitate therefore to recommend the establishment of schools in which they may be instructed by teachers speaking the same language with themselves and professing the same faith. There would be no inequality in such a measure. Since it happens from the force of circumstances if not from choice that the responsibilities of education are in most instances confided by us to native citizens and occasions seldom offer a trial of our magnanimity by committing that trust to persons differing from ourselves in language or religion. Since we have opened our country and all its fullness to the oppressed of every nation we should evince wisdom equal to such generosity by qualifying their children for the high responsibilities of citizenship."

The establishment of the Department of Education practically as at present constituted in New York, did not materially alter the situation as far as the Roman Catholic view held it. Bishop Hughes put new energy into the establishment of free parish schools and the example of the Roman Catholic body in New York had an equally potent effect on other sections of the country. Attempts were subsequently made to bridge the difficulty of the heavy double school tax by compromise. One known as "the Poughkeepsie Plan," was that of the pastor of Saint Peter's Church, Poughkeepsie, N. Y., who leased his schoolhouse to the local board of education at a nominal sum, the city authorities in return assuming all the expenses of running the school. No religious instruction was given during the regular school hours and the teachers were under the control of the local school board. Many Roman Catholics, lay and clerical, condemned this plan, but it was tolerated by the late Cardinal McCloskey, then archbishop of New York. This was in the early '70s of the last century. An adverse opinion by the superintendent of public instruction on the constitutionality of this plan caused its abandonment in 1899. The controversy reached its climax in 1891, when the Roman Catholics of the United States were divided into two opposing parties, or what might be called the strict constructionists and the liberals, over the question.

Some time before Archbishop Ireland had made an arrangement at two towns in his diocese, Faribault and Stillwater, by which the parish schools there received State money. This he described as follows:

"The plan to which allusion here is made is most simple. It accords both with State laws and Church requirements and on this account commends itself to all fair minded, intelligent citizens. An existing Catholic school, which observation shows to be in all particulars fit to be put on a line with existing public schools, is adopted by the public school board and conducted during school hours under all the laws and regulations of the board as to teachers and pupils. The board is supreme in all that regards the imparting of the instruction required by its own programme and during all the time marked in this programme. In return the board pays the current expenses. No State money is paid out for sectarian instruction; there is no division of the school fund; there is not the slightest setting aside of State rights.

There is on the other hand the serious advantage which all American citizens should appreciate—that Catholics have their children instructed under payments from the public fund to which they are contributors, together with their fellow citizens and the State has the satisfaction of bringing peaceably, and without violation of personal rights, under its direction, for the imparting of secular instruction, multitudes of Catholic children who otherwise must keep aloof from it.

"The Catholic conscience is satisfied under the plan. For while secular instruction is imparted there is no danger from Protestant or agnostic bias of teachers' minds, and the legal school hours over, the buildings revert to Catholic control and religious instruction is given. Nothing more than this is marked in a formal letter from Rome, written in 1875, as needed in order that Catholic children may be authorized by bishops to attend State schools."

The opponents of this plan contended that the archbishop's advocacy of such a scheme unsettled the whole Roman Catholic position hitherto held on the education question. Complaint was made to Rome against him and he drew up a memorial defending his position, which was submitted to the Congregation of the Propaganda. The decision on the plan—"tolerari potest" (it can be tolerated) evoked further excitement. But the plan itself did not succeed owing to local secular opposition. The State superintendent of public instruction, Dr.

D. L. Kiehle (November 1891), said of it in regard to a ruling that the contract could not bind in any such conditions as that of retaining religious teachers:

"A board of education cannot legally bind itself to follow any religious criterion in its choice of teachers, nor is it allowed to classify children according to their religion." And he adds that in case "the presence of the sisters in the school displeases a certain class of persons, or the habit they wear had a significance which was not acceptable, the board had the right of inviting them to dress like other teachers or else to withdraw."

The contract was therefore not renewed after the first year.

In the decade 1907-17 there was a special development of high schools and academies in conjunction with the parish schools, the latest statistics showing 600 such high schools for boys and 580 for girls. Another move was the organization of schools for the use of foreign-born immigrant children or their native-born brethren with parents from some of the 98 different countries and the 66 different languages that figure in our immigrant statistics. Just before the World War stopped immigration Prof. Herbert F. Wright of the Catholic University made a study of this educational problem and secured these statistics of Catholic parish schools thus engaged in the process of Americanizing their pupils:

			Teachers

The average number of pupils in these schools was 300; and in each class 45. Of these pupils there were 3 per cent more girls than boys. Of the teachers 91 per cent were Sisters of religious orders; 2½ per cent priests or Brothers and 6½ per cent lay teachers. The Sisters predominate in the schools of all nationalities except Greek-Ruthenian, where all but 12½ per cent are lay teachers.

When the archbishops met in New York for their annual convocation on 16 Nov. 1892, Monsignor Satolli, the apostolic delegate, appeared before them and delivered a letter of instruction from the Pope which he had received from Rome, and which contained 13 propositions "For the settling of the school question and the giving of religious education."

"It is to be greatly desired," the instruction said, "and would be a most happy arrangement if the bishop agree with the civil authorities or with the members of the school board to conduct the school with mutual attention and consideration for their respective rights.

"While there are teachers of any description for the secular branches who are legally inhibited from offending Catholic religion and morality—let the right and duty of the Church obtain of teaching the children catechism in order to remove danger to their faith and morals from any quarter whatsoever.

"We further desire you to strive earnestly that the various local authorities firmly convinced that it is more conducive to the welfare of the commonwealth than religion should by wise legislation provide that the system of education, which is maintained at the public expense and to which therefore Catholics also contribute their share, be in no way prejudicial to their conscience or their religion. For we are persuaded that even your fellow citizens who differ from us in belief with their characteristic intelligence and prudence will readily set aside all suspicions and all views unfavorable to the Catholic church, and willingly acknowledge her merit as the one that dispelled the darkness of paganism by the light of the gospel and created a new society distinguished by the lustre of Christian virtues and by the cultivation of all that refines. We do not think that anyone hereafter looking into these things clearly will let Catholic parents be forced to erect and support schools which they can not use for the instruction of their children."

The controversy was finally and conclusively settled by a letter of Pope Leo XIII to the bishops of the United States, May 1893, instructing them to "steadfastly observe" the decrees of the Third Plenary Council of Baltimore in regard to parochial schools.

THOMAS F. MEEHAN, A.M.

PARJANYA, pür-jün'yä, in the mythology of the Vedas, the rain god. He is associated with the thunder and the lightning and like all the rain gods, is the promoter of vegetation. In a sense, he is a culture god. His wife was the earth (mother). Naturally, on account of the relation of the rain to the other elements, Parjanya's name is often associated with the deities of the winds and the storms and with those of fire (as having its origin in the lightning). Three hymns are dedicated to him in the Rig-veda, in which he is mentioned some 30 times. Consult Macdonell, A. A., 'Vedic Mythology' (Strassburg 1897); 'History of Sanskrit Literature' (London 1913).

PARK, Edwards Amasa, American theologian: b. Providence, R. I., 29 Dec. 1808; d. Andover, Mass., 4 June 1900. He was graduated at Brown University in 1826, from Andover Theological Seminary in 1831 and was ordained pastor of the Congregationalist Church in Braintree, Mass., in the last-named year. He accepted the chair of moral and intellectual philosophy at Amherst in 1835 and in 1836 was appointed professor of moral and intellectual philosophy at Andover. From 1847-81 he held the chair of sacred rhetoric in that institution

and thereafter until his death he was professor of theology there. He was very successful as a teacher and he made the study of systematic theology intensely interesting. He attempted to divest theology of its artificiality. He edited the *Bibliotheca Sacra* until 1884, various translations from the German and several memoirs. Among them 'Samuel Hopkins' (Boston 1854); 'Nathaniel Emmons' (Boston 1861); and wrote 'Discourses on Some Theological Doctrines as Related to the Religious Character' (1885). Consult 'Memorial Collection of Sermons' (Boston 1902), a memorial volume of his works in celebration of his 90th birthday (Boston 1898); Storrs, R. S., 'Memorial Address' (New York 1900).

PARK, Mungo, Scottish African explorer: b. near Selkirk, 10 Sept. 1771; d. Boussa, Africa, 1806. He studied medicine, and especially surgery, at Edinburgh University and in 1792 sailed for the East Indies as assistant medical officer on board the East Indiaman *Worcester*. He made some botanical studies in Sumatra, found there eight new species of fish; returned in 1793 and in 1795 was sent by the African Association to explore the course of the Niger. With but two attendants he proceeded up the Gambia and after extreme hardships reached Sego in 1796. He finally arrived at Falmouth in 1797 and in 1799 published his 'Travels in the Interior of Africa,' which went through three editions in that year and made the author famous. In 1803 he became leader of an expedition despatched by the government for African discovery and in 1805 set out with instructions to follow the course of the Niger "to the utmost possible distance to which it can be traced." He set out with a party consisting of his brother-in-law, Anderson, 45 English soldiers and numerous natives. By the time they had reached the place where they were about to embark in canoes and float down the Niger to its mouth only seven of the whites were still alive. A few months later Anderson died. After having sailed over 1,000 miles in search of the mouth of the Niger and entered the rapids below Yuri, on the lower river, he ran into an ambush of the natives which lined both sides of the shore. In the attempt to escape Park and his three companions were drowned. He possessed the qualities of a great explorer and aroused British interest in African travels. Consult Memoir by E. Wishaw in Park's 'Journal of a Mission to the Interior of Africa' (1815); MacLachan, 'Life of Mungo Park.'

PARK, Roswell, American physician: b. Pomfret, Conn., 4 May 1852; d. 1914. He was educated at Racine College and Harvard, studied medicine at the Northwestern University, and was adjunct professor of anatomy there 1879-82. In 1883 he became professor of surgery at the University of Buffalo and later surgeon to the Buffalo General Hospital, and director of the State Pathological Laboratory (also in Buffalo). He was one of the attendants upon President McKinley after the latter was shot. He has published 'Lectures on Surgical Pathology' (1891); 'History of Medicine' (1897); 'Text-Book of Surgery'; 'Principles and Practices of Modern Surgery' (1907); 'Selected Papers, Surgical and Scientific' (1914).

PARK CITY, Utah, city in Summit County, on the Union Pacific and Utah Central railroads, 30 miles southeast of Salt Lake City. It is a silver mining region, with valuable mines in the vicinity and contains sampling works, quartz-mills, etc. Pop. (1920) 3,393.

PARK COLLEGE, a coeducational institution founded at Parkville, Mo., in 1875 through the exertions of Col. G. F. Parks and Rev. J. A. MacAfee. There is an academy connected with the college which prepares students for the college course and there are excellent buildings, dormitories and equipment. The president in 1919 was F. W. Hawley and there were 450 students attending college and 103 with the colors. The number of instructors was 18. The endowment of the college amounts to about \$500,000.

PARKE, John Grubb, American soldier: b. near Coatesville, Pa., 22 Sept. 1827; d. Washington, D. C., 16 Dec. 1900. He was graduated from West Point in 1849, assigned to the topographical engineering corps, and at the outbreak of the Civil War he was appointed brigadier-general of volunteers. He served under Burnside in North Carolina, was in command at the capture of Fort Macon, and in 1862 received promotion to the rank of major-general of volunteers. He was chief of staff of the Ninth corps at Antietam and South Mountain and served in that capacity under Burnside in the Army of the Potomac. He accompanied Sherman on his march to Vicksburg in command of the Ninth corps. In 1866 was retired from the volunteer service. He was in charge of the construction of fortifications in Maryland in 1867-68 and then became senior assistant in the office of engineers at Washington. He was promoted colonel of the corps of engineers in 1884 and in 1887 was appointed superintendent at West Point. He was retired at his own request in 1889. He published 'Compilations of Laws Relating to Public Works for the Improvement of Rivers and Harbors' (1877); 'Laws Relating to the Construction of Bridges over Navigable Waters' (1882).

PARKER, Alton Brooks, jurist: b. Cortland, N. Y., 14 May 1852. He was educated at the Cortland Normal School, taught school for a time and then began the study of law. He was graduated from the Albany Law School, was admitted to the bar and entered upon the practice of his profession at Kingston. In 1877 he was elected surrogate of Ulster County and in 1883 was re-elected. In 1884 he was a delegate to the Democratic National Convention and in 1885 President Cleveland offered him the office of First Assistant Postmaster-General, which, however, he declined. In 1885 he was chairman of the Democratic State Committee and in that same year was appointed a judge of the State Supreme Court to fill a vacancy, the next year being elected without opposition. In 1889 he was appointed to the Second Division of the Court of Appeals and when that court was dissolved was appointed a member of the General Term of the First Department, and in 1896 a member of the Appellate Division. In 1897 he was elected Chief Judge of the Court of Appeals of his State. He wrote many of the important decisions of the Court of Appeals and served until his resig-

nation in 1904. During the period of his service on the bench he abstained from taking any active part in practical politics and it was only because the leaders respected his personal wish that he did not become the candidate for governor of his State upon the Democratic ticket in 1902. The chosen candidate of that year ran so close to victory that the party leaders complained to him that his reluctance to run had lost the election of the party which had made him chief judge of the State. They then drew from him the promise that should the party throughout the nation in 1904 call upon him to serve as its candidate for President he would put aside his personal wishes. Having obtained this promise, the party leaders at once began to pave the way for his nomination on the Democratic ticket for the presidency in 1904. Judge Parker, although taking no part in the advancement of this campaign, adhered to his promise and took no action to prevent the nomination as he had done in 1902. The efforts of the party leaders were successful and Judge Parker was nominated for the presidency by the Democratic Convention at Saint Louis 9 July 1904. Immediately after the receipt of the news of his nomination and of the contest which had occurred in the Convention over the money question plank in the platform, Judge Parker sent his famous "Gold Telegram" stating his position upon the money question and offering the Convention the opportunity before adjournment to substitute another candidate if dissatisfied with his position upon that question. The Convention reaffirmed the nomination of Judge Parker. The principal issue of the campaign arose upon Judge Parker's assertion of a heavy levy by the Republican Party upon the moneyed interests for campaign funds. He was defeated at the polls by Theodore Roosevelt. Judge Parker resigned from the Court of Appeals as soon as he and his associates could finish the writing of opinions in the undecided cases and before formally accepting the nomination of the Democratic Convention. After his defeat, Judge Parker went to New York City and in November 1904 opened an office and since that time has continued to practise law in New York City. He is one of the most prominent of the attorneys practising there and has handled many important cases. He appeared for the city of New York in its fight for 80-cent gas and was finally victorious in that case in the United States Supreme Court. He had charge of the litigation out of which grew the government suit against the Drug Trust under which it was dissolved in 1907 and also of the subsequent litigation as a result of which a large number of the New York wholesale houses who had been in the Trust, were compelled to pay heavy damages to the Parks firm in Cincinnati, which had been the principal foe of the Trust. He was counsel for Mayor McClellan throughout his fight against William R. Hearst, arising over the mayoralty election, in which Hearst sought to obtain a recount of the ballots. He was attorney for Samuel Gompers, John Mitchell and Frank Morrison in their great battle with Judge Silas Wright of Washington, in which the judge sought to punish the three labor leaders for contempt for an alleged violation of the court's injunction. In this case also Judge Parker was victorious in

the United States Supreme Court. But the case was before that court twice and on the last appeal there was a reargument. Such leisure as his law practice allows is largely devoted to public matters. He was president of the American Bar Association in 1906. He was one of the organizers of the New York County Lawyers' Association and was its second president in 1909 and was re-elected for the two subsequent years. He was president of the New York State Bar Association in 1913 and 1914. He has presided at a number of Democratic State conventions and was the temporary chairman of the Democratic National Convention in 1912. He belongs to numerous organizations like the American Peace Society, the League to Enforce Peace, the National Security League, American Academy of Jurisprudence. The object of each of these various organizations is to promote some public good and Judge Parker unselfishly devotes his valuable time and labor to these causes and to many others.

PARKER, Arthur Caswell, American archaeologist: b. Iroquois, N. Y., 1881. He was educated at Williamsport Dickinson Seminary and later studied anthropology under Prof. F. W. Putnam. He was special assistant archaeologist at the American Museum of Natural History in 1901-02; field archaeologist at the Peabody Museum in 1903; ethnologist of the New York State Department of Education in 1904-06; since when he has been archaeologist of the New York State Museum. He edited the *American Indian Magazine*, the quarterly journal of the Society of American Indians, in 1913-16; and is author of 'Excavations in an Erie Indian Village' (1907); 'Iroquois Uses of Maize and other Food Plants' (1910); 'The Code of Handsome Lake, the Seneca Prophet' (1913); 'The Legal Status of the American Indians' (1915); 'The Constitution of the Five Nations' (1916), etc.

PARKER, Daniel, a Baptist innovator. See BAPTISTS, TWO-SEED-IN-THE-SPIRIT.

PARKER, Edward Harper, English Chinese scholar: b. 3 July 1849. He was educated at the Royal Institution School, Liverpool, and became a barrister of the Middle Temple. He intended to engage in the tea trade, studied Chinese, and as an interpreter traveled in Mongolia 1869-71. He was then in the consular service in various parts of the world (1871-95), and since 1901 has been professor of Chinese in Victoria University, Manchester, and reader in Chinese, University College, Liverpool, since 1896. He is the author of 'Comparative Chinese Family Law' (1879); 'The Opium War' (1887); 'China's Relations with Foreigners' (1888); 'Up the Yangtze' (1892); 'Burma' (1893); 'A Thousand Years of the Tartars' (1895); 'China' (1901); 'John Chinaman' (1901); 'China, Past and Present' (1903); 'China and Religion' (1905); 'Ancient China Simplified' (1908); 'Studies in Chinese Religion' (1910).

PARKER, Edwin Wallace, American Methodist Episcopal missionary bishop: b. Saint Johnsbury Vt., 21 Jan. 1833; d. Paini Tal, India, 4 June 1901. He was graduated at the General Biblical Institute, Concord, N. H., in 1857, and joined the Vermont Conference in that year. After two years' work as a pastor

he was ordained deacon and elder under the missionary rule of the New England Conference and sailed for India, where he was stationed first in the district of Bijnor and afterward at Moradabad. On the organization of the India Conference in 1864 he became presiding elder, and in 1900 he was elected bishop of Southern Asia. Consult Messmore, J. H., 'Life of Edwin Wallace Parker' (1903).

PARKER, Foxhall Alexander, American naval officer: b. New York, 5 Aug. 1821; d. Annapolis, Md., 11 June 1879. He entered the navy as midshipman in 1839, was attached to the West Indian squadron, and later transferred to the Philadelphia naval school, where he was graduated in 1843. He served on the Great Lakes, the Mediterranean, the Pacific, and on various coast surveys until 1861, when he was appointed executive officer of the navy yard at Washington, D. C. His capable manipulation of the forces at his command after the battle of Bull Run in 1861 went far toward restoring order and confidence at Washington. He performed excellent service throughout the War, receiving the rank of captain in 1866. He subsequently served on various commands, was raised to the rank of commodore in 1872, and was one of the founders of the Naval Institute at Annapolis in 1873. In 1877-78 he was in charge of the Boston navy yard, and in 1878, until his death, was superintendent of the Naval Academy at Annapolis. He published 'Fleet Tactics under Steam' (1863); 'Squadron Tactics under Steam' (1863); 'The Naval Howitzer Afloat' (1865); 'The Fleets of the World: the Galley Period' (1876); 'The Battle of Mobile Bay' (1878).

PARKER, Francis Wayland, American educator: b. Bedford, N. H., 9 Oct. 1837; d. 1902. He was educated in the public schools and taught until the outbreak of the Civil War, when he enlisted and served until its conclusion, rising to the rank of colonel of volunteers. He was again engaged in teaching until 1872, when he went to the University of Berlin for special study in pedagogy, philosophy and psychology. He was later superintendent of schools at Quincy, Mass., and at Boston, and was principal of the Normal School, Cook County, Ill. He wrote a number of textbooks, some of which ran into many editions. Among them are 'Talks on Teaching' (1883); 'The Practical Teacher' (1884); 'Course in Arithmetic' (1884); 'How to Teach Geography' (1885); 'How to Study Geography' (1889), etc.

PARKER, George Howard, American zoologist: b. Philadelphia, 23 Dec. 1864. He was graduated at Harvard in 1887, later pursuing special courses there and at the universities of Leipzig, Berlin and Freiburg. He became assistant instructor in zoology at Harvard in 1888 and occupied different positions there, becoming professor of zoology in 1906. He has made special investigations concerning the anatomy and physiology of sense organs and animal reactions and has contributed reports of them to the zoological periodicals. He was William Brewster Clark lecturer at Amherst College in 1914 and in that year was sent by the United States Government to investigate the Pribilof seal herd.

PARKER, Herschell Clifford, American physicist and explorer: b. Brooklyn, N. Y., 9

July 1867. He was graduated at the Columbia School of Mines in 1890, and was connected with the faculty there in 1891-1911, filling the chair of physics for some time before his resignation. He made explorations and first ascents in the Canadian Alps in 1897, 1899 and 1903; first ascents of the mountains Goodsir and Dawson in British Columbia, and of Hungabee, Deltaform, Biddle and Lefroy in Alberta, and explorations of the Mount McKinley region in Alaska in 1906, 1910 and 1912. He made the first ascent of the highest peak of Mount McKinley in 1912. Author of 'A Systematic Treatise on Electrical Measurements' (1897); and many contributions to scientific periodicals. He was one of the discoverers of "helium" and invented the "helioscope."

PARKER, SIR (Horatio) Gilbert, Canadian novelist: b. Camden East, Addington, Ontario, 23 Nov. 1862. He was educated at Trinity College, Toronto, in 1886 became associate editor of the Sydney (Australia) *Morning Herald*, and during his stay in Australia began to write plays. He traveled widely among the South Sea Islands and in northern Canada, and published a book of travel entitled 'Round the Compass in Australia' (1892). His novels include 'Pierre and His People: Tales of the Far North' (1892); 'Mrs. Falchion' (1893); 'The Trespasser' (1893); 'Translation of a Savage' (1894); 'The Trail of the Sword' (1895); 'When Valmond Came to Pontiac' (1895); 'An Adventurer of the North' (1895); 'The Seats of the Mighty' (1896), a romance of the taking of Quebec; 'The Stolen Bonds' (1897); 'The Pomp of the Laviettes' (1897); 'The Battle of the Strong' (1898); 'The Lane that had no Turning' (1900); 'The Right of Way' (1901); 'Donovan Pasha' (1902); 'History of Old Quebec' (1903); 'A Ladder of Swords' (1904); 'The Weavers' (1907); 'Northern Lights' (1909); 'Cumner's Son' (1910); 'The Land of the People, and the State' (1910); 'The Judgment House' (1913); 'You Never Know Your Luck' (1915); 'The World in the Crucible' (1915); 'The Money Master' (1915); 'The World For Sale' (1916); 'Wild Youth and Another' (1919). His works of wide popularity exhibited a finished method and much skill in characterization and description. In 1900 and 1906 he was elected to Parliament in the Conservative interest for Gravesend, in 1902 was knighted and in 1915 was created a baronet.

PARKER, Horatio William, American composer: b. Auburndale, Mass., 15 Sept. 1863; d. Cedarhurst, L. I., 18 Dec. 1919. His education was for the most part European, and in 1885 he graduated from the Munich Royal Conservatory. After that time he was professor of music in the Cathedral School of Saint Paul, Garden City, L. I., and organist of Holy Trinity Church, New York, until 1893, when he became organist of Trinity Church, Boston. After 1894 he was professor of the theory of music at Yale University. His compositions rank high in American music; they include the oratorio 'Hora Novissima' (1893), the first American music given at an English musical festival; 'A Wanderer's Psalm' (1900), also given at one of the English festivals; the oratorio of 'Saint Christopher' (1896); the cantatas 'King Trojan' (1885); 'The Kobolds'; and 'Harold

Harfagar' (1891); 'The Dream King' (1893); 'A Star Song' (1901); 'The Leap of Roushan Bey' (1914). With Brian Hooker as librettist, in 1911 he won the Metropolitan Opera House \$10,000 prize with the opera 'Mona,' and in 1915 the Los Angeles \$10,000 prize with the opera 'Fairylend.' In 1915 he wrote the oratorio 'Morven and the Grail' for the centenary celebration of the Handel and Haydn Society of Boston. Among other compositions are symphonies, overtures, chamber music, piano-forte and organ numbers and numerous songs. In 1902 he received the degree of Mus. Doc. from Cambridge University.

PARKER, Sir Hyde, English admiral: b. Devonshire, England, 1739; d. 16 March 1807. He entered the British navy, served in the war of the American Revolution, where in 1776 he commanded a small squadron, and for services in the North River was knighted in 1779. He was promoted rear-admiral in 1793, vice-admiral in 1794, and appointed commander-in-chief at Jamaica in 1796. He returned to England in 1800, was given command of the Baltic fleet and moved northward to check the measures of the armed neutrality formed by Russia, Sweden and Denmark. In the battle of Copenhagen he had no share, it being an independent move of Nelson's, who was second in command and more daring than his commander. Parker compelled Sweden to remain inactive by his appearance before Carlskrona, and was preparing to move upon Cronstadt when the death of Emperor William ended hostilities. He was shortly afterward succeeded by Nelson, and thenceforward until his death lived in retirement.

PARKER, Joel, American Presbyterian clergyman and educator: b. Bethel, Vt., 27 Aug. 1799; d. New York, 2 May 1873. He was graduated at Hamilton in 1824, and after studying at the Auburn Theological Seminary was ordained in the Presbyterian Church. He was pastor at Rochester in 1826-30; organized the Dey Street Church in New York and was its pastor until 1832, when he went to a pastorate in New Orleans; and in 1838-40 he was in charge of the Tabernacle Presbyterian Church on Broadway, New York. Upon its being closed he became president of the Union Theological Seminary and occupied the chair of sacred rhetoric. He later held charges in Philadelphia in 1842-54, in New York at the Bleecker Street Presbyterian Church in 1854-63 and at Newark, N. J., in 1863-68. He was for a time associate editor of the *Presbyterian Quarterly Review* and was author of 'Lectures on Unitarianism' (1829); 'Reasonings of a Pastor' (1849); 'Pastor's Initiatory Catechism' (1855), etc.

PARKER, Joel, American statesman: b. Monmouth County, N. J., 24 Nov. 1816; d. Philadelphia, Pa., 2 Jan., 1888. He was graduated from Princeton in 1839, admitted to the bar in 1842 and established a law practice in Freehold, N. J. He engaged in politics with much zest, and in 1847 was elected to the New Jersey legislature; and in 1852-57 he was prosecuting attorney of Monmouth County. At the outbreak of the Civil War he was appointed major-general of volunteers and in 1862-66 was governor of New Jersey, giving loyal support to the policy of the national administration.

He was again elected governor in 1870, and in 1880 was appointed associate justice of the Supreme Court of New Jersey, and reappointed in 1887.

PARKER, John Henry, English archaeologist: b. London, 1 March 1806; d. Oxford, 31 Jan. 1884. He began his career as a bookseller in Oxford in 1832. Later he superintended many excavations in Rome, and was the author of 'The Archaeology of Rome' (1874-84), a work of importance on the walls, aqueducts and tombs of the Eternal City. His other publications are a 'Glossary of Architecture' (1836), an important aid to the revival of Gothic art; 'Introduction to the Study of Gothic Architecture' (1849); 'The A B C of Gothic Architecture.'

PARKER, Joseph, English Congregational clergyman: b. Hexham-on-Tyne, Northumberland, 9 April 1830; d. London, 28 Nov. 1902. He studied at University College, London, in 1853 became pastor of the Congregational church at Banbury, and in 1858-69 was pastor of the Cavendish Street Church at Manchester. In 1869 he began his larger ministry at the old Poultry Chapel of London, the congregation of which was transferred in 1874 to the City Temple, Holburn Viaduct. He became one of the best-known preachers in England. His views were liberal, and he spoke with a ready command of vigorous English. In 1887 he visited the United States where he delivered an eulogy on Henry Ward Beecher, with whom he had been on very intimate terms. He was twice chairman of the Congregational Union of England and Wales, and published several works, including 'Ecce Deus' (1868); 'Springdale Abbey' (1869); 'The Paraclete' (1874); 'The People's Bible,' "discourses upon Holy Scripture, forming a pastoral commentary" (25 vols., 1885 et seq.); 'Tyne Chylde' (1883); 'Christian Profiles in a Pagan Mirror' (1898); and 'A Preacher's Life,' an autobiography (1899). Consult Adamson, William, 'Life of Joseph Parker' (New York 1903).

PARKER, Lawton S., American portrait painter: b. Fairfield, Mich., 7 April 1868. He studied at the École des Beaux Arts, Paris, and in 1892 was appointed professor of the Saint Louis School of Fine Arts. He became director of art at Beloit College in 1893, president of the New York School of Art in 1898-99, and of the Chicago School of Fine Arts in 1903. Among his sitters are Martin A. Ryerson, J. Ogden Armour, N. W. Harris, Harry P. Judson and Peter S. Grosscup, his portraits being marked by excellent characterization. He received the silver medal at the Saint Louis Exposition in 1904; gold medals at the International Exposition, Munich, in 1905, and at the Paris Salon in 1913; and was awarded the medal of honor at the Panama Exposition in 1915.

PARKER, Linus, American bishop of the Methodist Episcopal Church, South: b. Oneida County, (N.Y.?) 1829; d. New Orleans, La., 5 March 1885. He went to New Orleans when a youth and found employment, studying Latin, Greek and other branches in his leisure time, and at the age of 21 entered the Louisiana Conference. He was for four years a circuit rider, then becoming pastor of various churches

in New Orleans and later presiding elder of his district. He edited the *New Orleans Christian Advocate* in 1870-82 and sat in the quadrennial sessions of the General Conference held during that time. He was elected bishop in 1882.

PARKER, Louis Napoleon, English dramatist and composer: b. Calados, France, 21 Oct. 1852. He was educated at Freiburg and the Royal Academy of Music, and was director of music in Sherborne School, Dorsetshire, 1877-96. In the latter year he removed to London and in 1898 was made a Fellow of the Royal Academy of Music. He is the author of many cantatas, such as 'Silvia' and the 'Twenty-third Psalm,' as well as many other musical compositions and of a large number of plays. Among the latter may be cited 'Change Alley,' and 'The Man in the Street.' He has also translated 'Magda'; 'L'Aiglon'; 'Cyrano de Bergerac,' and other dramas.

PARKER, Matthew, second Protestant archbishop of Canterbury: b. Norwich, 6 Aug. 1504; d. Canterbury, 17 May 1578. He entered Corpus Christi College, Cambridge, in 1522, and was graduated in 1525. Two years afterward he was ordained priest, and elected Fellow of his college. His favorite studies were the Scriptures, the church fathers and other ecclesiastical writers. In 1535 he was made chaplain to Queen Anne Boleyn, who shortly before her death commended to his care her daughter Elizabeth. This appointment carried with it the deanery of the College of Saint John the Baptist at Stoke-by-Clare, in Suffolk. He early imbibed Reformation principles and, in 1537, after the death of Anne Boleyn, Henry VIII made him one of his chaplains, and about five years afterward appointed him canon of Ely. In 1544 he was appointed to the mastership of Corpus Christi College, Cambridge, for which he compiled a new body of statutes; and in the following year was elected vice-chancellor of the university, and presented with the rectory of Land Beach. In 1547 he married Margaret Harlstone, the daughter of a Norfolkshire gentleman. In 1552 he was elected prebendary and afterward dean of Lincoln; but on the accession of Mary to the throne was stripped of these as well as his other preferments. A portion of his time he now spent in translating the Psalms into English verse. He also wrote a treatise, 'De Conjugio Sacerdotum,' defending the marriage of priests. When Elizabeth succeeded to the throne he was raised to the archbishopric of Canterbury, his consecration taking place 17 Dec. 1559. During his 15 years' primacy he labored to make clear the belief and discipline of the Church, and published his "Advertisements" for the regulation of divine service. In 1568 was published under his direction and his expense the Bishops' Bible, which was a revision of the text founded on Cranmer's translation; he was likewise prominently associated with those who drew up the Book of Common Prayer. He edited the histories of Matthew of Westminster, Matthew Paris and others; and had a considerable share in the work 'De Antiquitate Britannicæ Ecclesiæ.' Archbishop Parker was the founder of the Society of Antiquaries. His valuable collection of manuscripts relating to the civil and ecclesiastical history of England he presented to his

own college at Cambridge and founded a number of valuable fellowships there. Consult 'Life and Letters of Matthew Parker' (Parker Society, 1853); Strype, 'Life and Acts of Matthew Parker' (1824); Hook, 'Lives of the Archbishops of Canterbury' (1872).

PARKER, Peter, American Congregationalist clergyman, physician and diplomat: b. Framingham, Mass., 18 June 1804; d. Washington, D. C., 10 Jan. 1888. He was graduated at Yale in 1831, took his M.D. there in 1834, and, having taken the theological course as well, was ordained in the ministry in that year and sent to China as a missionary. He established a hospital for diseases of the eye at Canton immediately after his arrival, but found other needs for medical attention so urgent that he admitted a wide variety of cases, 2,000 patients being cared for in the first year. He gained fame as a surgeon, acted in the capacity of a preacher, and also trained a number of natives in medicine and surgery. He closed his hospital during the war between China and England in 1840 and revisited the United States, but returned to China in 1842 and reopened the hospital, increasing its staff and capacity. He severed his connection with the American Board of Missions in 1845, and while retaining charge of the hospital acted as interpreter for the United States embassy, serving as chargé-d'affaires when the minister was absent. He returned to the United States for the benefit of his health in 1855, but in the same year accepted an appointment of the United States government as a commissioner to China, with power to revise the treaty of 1844. He remained in China in connection with this work in 1855-57 and then resigned. He was a regent of the Smithsonian Institute from 1868. Author of 'Journal of an Expedition from Singapore to Japan' (1838); 'A Statement Respecting Hospitals in China' (1841); 'Notes of Surgical Practice Among the Chinese' (1846), etc.

PARKER, Theodore, American clergyman and social reformer: b. Lexington, Mass., 24 Aug. 1810; d. Florence, Italy, 10 May 1860. He was the youngest of 11 children and received his early education at home. He took the arts course at Harvard, studying at home and visiting Cambridge for the examinations; and though he was unable thus to obtain a degree in course, that of M.A. was conferred upon him *honoris causa* in 1840. In 1834-36 he studied at the Cambridge Divinity School, and after preaching as a candidate was ordained 21 June 1837 and installed as pastor of the West Roxbury Unitarian Church. It was soon noised about that he was not in agreement with the Unitarian position of the time. His outspokenness had already won for him the reproach of "infidel," and many of the Unitarian clergy had found exchanges of pulpit with him inconvenient before his discourse on 'The Transient and Permanent in Christianity' at the ordination of C. C. Shackford at South Boston, 19 May 1841. In this sermon Parker denied the special authority of the Bible, the supernatural origin of Christianity and the supernatural character and divine mission of Christ. It is perhaps not surprising that most pulpits were now closed against him, and that his name was associated with those of leaders of irreligion. His

own congregation gave him steadfast support. He did not withdraw from the Unitarian Church, believing, apparently, that that Church was liberal enough to suffer a freedom of thought even so great as his; while the Church never formally expelled him from its ministry, being, it would seem, reluctant to afford him the prestige which might result from such action. But he was thenceforth actually an independent preacher. In 1846 he became pastor at Boston of what he always called the "Twenty-eighth Congregational Society." Services were held until 1852 in the Melodeon, and in 1852-59 in the Music Hall, whose 3,000 seats were generally fully occupied. The regular membership was never large, but all shades of religious dissatisfaction there assembled, and many others were drawn by Parker's championship of humanitarian endeavors, especially of anti-slavery reform. In this cause "probably no one—not Garrison, not Phillips himself," says Frothingham, "did more to awaken and enlighten the conscience of the North." He was a leader in the committee of vigilance, received runaway slaves, fought the rendition of such and aided their escapes. For many years he was a popular lecturer, and to this activity gave much time. Both in the pulpit and on the platform he had none of the arts of the practised orator, but carried weight rather by his massive knowledge, deep conviction, frankness and vigorous and often picturesque English. Ill-health compelled the foreign sojourn during which he died. He was editor of the *Massachusetts Quarterly Review* in 1849-51, and wrote, besides sermons, several works, including 'Historic Americans' (1870) and 'Views of Religion' (1885), which have been collected by F. P. Cobbe (1870). For his peculiarly individual religious beliefs consult Clarke, 'Parker and his Theology' (1859); and the 'Lives' by Frothingham (1874) and Chadwick (1901); 'The Works of Theodore Parker' (10 vols., Boston 1912).

PARKER, Willard, American surgeon; b. Hillsborough, N. H., 2 Sept. 1800; d. New York, 25 April 1884. He was graduated from Harvard in 1826, studied medicine and took his degree there in 1830, when he accepted a professorship in the Berkshire Medical College, Pittsfield, Mass. In 1836 he accepted the chair of surgery in the Cincinnati Medical College, but removed in 1839 to New York, where he had been appointed professor of surgery in the College of Physicians and Surgeons, which position he held for 30 years. He established a large practice in New York and as a surgeon he took high rank, making many advances in methods as well as important discoveries. He established the first college clinic in the United States at the College of Physicians and Surgeons in 1840; organized the New York Pathological Society in 1843; the New York Academy of Medicine in 1847, of which he was president for many years after 1856. From 1865 he was president of the State Inebriate Asylum at Binghamton, where his conduct of the management was very successful. He was consulting physician at the leading New York hospitals and connected with many medical organizations.

PARKER, William Belmont, American editor; b. Haverbury, England, 19 Sept. 1871. He came to the United States in early youth, was

graduated at Harvard in 1897, and in 1898-1902 was assistant editor of the *Atlantic Monthly*. He was literary adviser to Houghton, Mifflin and Company, New York, in 1902-04; instructor in English at Harvard in 1904-05 and lecturer in that subject at Columbia in 1905-08. He was advisory editor of the *Associated Sunday Magazines* in 1906-08, and literary editor of the *World's Work* in 1908. He was editor and literary adviser to the Baker and Taylor Company in 1909-12, and literary adviser to the Century Company in 1912. He was business manager of the *Churchman* in 1912-14, and has been an editor with S. Pearson and Son since 1914. He edited Lowell's 'Anti-Slavery Papers' (1903); Sir Philip Sidney's 'Certain Sonnets' (1904); 'Complete Poems of Edward Rowland Sill' (1906); 'The Wisdom of Emerson' (1909); and was joint editor of 'Letters and Addresses of Thomas Jefferson' (1905). Author of 'Life of Edward Rowland Sill' (1915).

PARKER'S CROSS ROADS (Tenn.), **Engagement at**. On the morning of 11 Dec. 1862 Gen. N. B. Forrest, with about 2,500 cavalry, left Columbia, Tenn., to operate in the western part of the State and fall upon General Grant's communications with Columbus. On the 13th he reached the Tennessee River at Clifton, about 50 miles east of Jackson, crossed on a flatboat, and on the 16th reached Lexington, where he met 700 of the 11th Illinois Cavalry and two guns, under command of Col. R. G. Ingersoll, and routed Ingersoll, capturing him and nearly one-fourth of his command. Two detachments were now sent to cut the Mobile and Ohio Railroad at points north and south of Jackson, and on the 19th Forrest, with the remainder of his command, not over 600 men, moved on the town, and was met by a force of infantry and cavalry, which disputed his advance, but which was gradually driven back until within reach of the defenses of the place, when Forrest withdrew and, uniting his command, turned north on the line of the railroad. He captured Humboldt and Trenton, at the latter place taking and paroling its garrison of 700 men. Several small posts were captured and the railroad destroyed as far as the Kentucky line. On the 25th he retraced his steps toward the southeast, closely followed by General Sullivan with 4,000 men. On 31 December, at Parker's Cross Roads, a few miles north of Lexington, Sullivan's leading brigade of 1,500 men, under Col. C. L. Dunham, intercepted Forrest's march, but Forrest attacked it and drove it eastward and southward from the crossroads. The fighting lasted several hours, during which time Sullivan came up with Col. J. W. Fuller's brigade, and at 3 P.M. struck Forrest's rear and soon defeated him, taking 400 prisoners, six guns and several caissons and ammunition-wagons. The Union loss was 27 killed, 140 wounded and 70 missing. The Confederate loss in killed and wounded is not known. Forrest continued his retreat, brushed away the Sixth Tennessee Cavalry that had been sent to intercept him at Clifton, and 1 and 2 Jan. 1863 recrossed the Tennessee River, having destroyed the railroad at many points between Jackson and Columbus, also a large quantity of stores, and claiming that with a loss of less than 400 men he had killed, wounded and captured nearly 2,500. Consult

'Official Records' (Vol. XVII); Greene, 'The Mississippi'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. III).

PARKERSBURG, pär'kèrz-bèrg, W. Va., city, county-seat of Wood County, on the Ohio River at the mouth of the Little Kanawha, and on the Baltimore and Ohio Southwestern, the Ohio River and the Baltimore and Ohio railroads, about 65 miles north of Charleston, the State capital, and .75 miles in direct line southwest of Wheeling. The city is connected by steamers with the river ports on the Ohio. It was settled in 1773; in 1820 was incorporated, and chartered as a city in 1863. Near by is the island where once lived Harman Blennerhassett (q.v.). It is in an agricultural region; in the vicinity are valuable clay and coal deposits, gas and petroleum wells and several mineral springs noted for their medicinal qualities. The chief industrial establishments are oil refineries, oil-well supply works, foundries, machine shops, flour and lumber mills, veneer works, furniture factories, shovels, clothing, glass, porcelain, shoes. It has an extensive trade in manufactured goods, farm products and coal. The prominent buildings are the city hospital, government building, city-hall, courthouse, some of the school buildings, Saint Joseph's Hospital, Masonic Temple, Y. M. C. A. The educational institutions are the Academy of the Visitation (R. C.), the new \$400,000 high school, public and parish elementary schools and a public library. A new \$450,000 passenger bridge spans the Ohio River connecting Belpre, Ohio, with Parkersburg. A railroad bridge, one and one-third miles long, crosses the Ohio. It was opened in 1871 and constructed at a cost of \$1,000,000. Three fine bridges span the Little Kanawha. The location near the raw material, and the facilities for transportation combine to make Parkersburg an important manufacturing city. The city is governed on the commission plan since 1911. Pop. (1920) 20,050.

PARKES, pärks, **Elizabeth Robins** ("C. E. RAIMOND," "ELIZABETH ROBINS"), American author and actress: b. Louisville, Ky. She was married to G. R. Parkes, an actor, in 1885, and has spent much of her life in London, where she has appeared in several Ibsen rôles. She has published 'The Fatal Gift of Beauty and Other Stories'; 'George Mandeville's Husband'; 'The New Moon'; 'An Open Question'; 'The Magnetic North'; 'A Dark Lantern'; 'The Convert'; 'Under the Southern Cross'; 'Come and Find Me'; 'The Mills of the Gods'; 'The Florentine France'; 'My Little Sister'; 'Way Stations.'

PARKES, Sir Harry Smith, English diplomatist: b. Birchills Hall, near Walsall, Staffordshire, 24 Feb. 1828; d. Peking, China, 21 March 1885. He was orphaned at the age of five years, remaining under the care of an uncle and receiving his education at King Edward's grammar school. The death of his uncle caused him to go to China to make his home with a cousin at Macao, in 1841. He there began the study of the Chinese language and in 1842 he was appointed secretary and first interpreter to Sir Henry Pottinger, the British Plenipotentiary at Hongkong. Although then but 14 years of age he accompanied Sir Henry's expedition up the Yangtze-kiang to Nanking, took part in the

capture of Chingkiang and the surrender of Nanking and was present at the signing of the peace treaty. He continued in the consular service, mastering the language and becoming an adept in dealing with the Chinese, and in 1854 he was appointed consul at Amoy. In 1855 he was secretary to the mission to Bangkok, where he took a leading part in concluding the first European treaty with Siam. He became acting consul at Canton in 1856, where he was brought into contact with Mandarin Yeh, whose open defiance of China's treaty obligations to England culminated in the seizure of the British ship *Arrow* and her crew, 8 Oct. 1856. Parkes immediately summoned the aid of the British governor of Hongkong and Admiral Sir M. Seymour was sent to his assistance. Canton was taken in December 1857 and Parkes became practically governor of the city, a position he held for nearly four years. He succeeded in restoring order in the city, revived trade, made it safe for foreigners to enter the city and did much to conciliate and win the confidence of the Chinese. While still engaged in this work in 1860 hostilities were renewed in the north and Parkes was ordered to the assistance of Lord Elgin. It was while acting as a commissioner to arrange a meeting between the British and Chinese authorities that Parkes and other British and French officers were taken prisoners by the Chinese, subjected to tortures and herded with the worst elements in the prison; they were confined there 11 days before they were removed to a Chinese temple. They were then informed that they were to be executed, but the sentence was suspended owing to the capture by the British of the Summer Palace. Parkes and his companion, Loch, were then permitted to return to the British lines but most of the other prisoners had died under the harsh treatment they received. In punishment for the treachery of the capture and the murderous severity with which the prisoners who died were treated, Lord Elgin burned the Summer Palace, which had previously been looted by the French. After accompanying the British embassy to its new residence in Peking, Parkes returned to his post in Canton where he remained until the city was restored to the Chinese in October 1861. He returned to England on leave of absence, was knighted in 1862 and in 1864 was sent to Shanghai as consul. In 1865 he was appointed Minister to Japan where for 18 years he not only ably served British interests but gave considerable assistance to the Japanese Liberals. He was transferred to Peking as British Minister there in 1882, and also became Minister to Korea with whom he concluded a satisfactory treaty. He succeeded in securing the immediate repudiation of the Chinese proclamation of 1884, by which all French residents might be poisoned, but died in the following year through overexertion incurred in the disturbances incident to the French attack upon Tongking. Consult Lane-Poole, 'Life' (2 vols., 1894).

PARKES, Sir Henry, Australian statesman: b. Stoneleigh, Warwickshire, 27 May 1815; d. 27 April 1896. His father was a farmer; the son became an ivory turner and in 1839 emigrated to Sydney. For several years his life was a hard struggle with poverty. He entered

politics as a leader of the "anti-transportationists"; founded in 1849 *The Empire*, a liberal organ which he edited until 1857. In 1854 he was elected to the legislative council, in which he led the fight for responsible government, and he was a member of Parliament for East Sydney (1858-61), colonial secretary (1866-68), and again a member of the colonial parliament (1871), becoming Prime Minister of New South Wales in 1872. His cabinet remained in office until 1875, and he was again Prime Minister 1878-82 and 1887-89. He was a prominent adherent of the cause of Australian federation, insisted on democracy as the basis of any such scheme and successfully opposed Wentworth's plan of a bicameral legislature, with colonial peers in the upper House. He was a personal friend of Tennyson, and himself wrote several volumes of verse and prose; among the latter being 'Australian Views of England' (1869); 'Federal Government in Australia' (1890); 'Fifty Years in the Making of Australian History' (his autobiography, 1892); 'An Emigrant's Home Letters' (1897). Consult his political autobiography; Lyne, 'Life of Sir Henry Parkes' (London 1897); and an article by Marin La Meslée in *Revue des Deux Mondes* (1892, Tome III).

PARKESBURG, Pa., borough in Chester County, 44 miles west of Philadelphia, on the Pennsylvania Railroad. It is situated in a thriving agricultural region, and has iron and chemical works, and a flour mill. Pop. 2,522.

PARKHURST, pàrk'hèrst, **Charles Henry**, American Presbyterian clergyman: b. Framingham, Mass., 17 April 1842. He was graduated at Amherst in 1866, studied theology at Halle 1869-70 and at Leipzig 1872-73, taught in Wiliston Seminary 1870-71, was pastor of the Congregational church of Lenox, Mass., 1874-80, and from the last named date was pastor of the Madison Square Presbyterian Church, New York, until its amalgamation with the First Presbyterian Church. His work as president of the Society for Prevention of Crime, notably his personal study at first hand of the problem of crime in New York, led to the famous Lexow investigation of the charge that the police were in league with metropolitan criminals. He wrote, besides some philological studies and various contributions to periodicals, 'Forms of the Latin Verb illustrated by the Sanscrit' (1870); 'The Blind Man's Creed' (1883); 'The Pattern on the Mount' (1885); 'Three Gates on a Side' (1887); 'What Would the World be Without Religion?' (1888); 'The Swiss Guide' (1889); 'Our Fight with Tammany' (1895); 'The Sunny Side of Christianity' (1901); 'Talks to Young Men and to Young Women' (1897); 'Guarding the Cross with Krupp Guns' (1900) and 'A Little Lower than the Angels' (1909).

PARKHURST, Howard Elmore, American musician and author: b. Ashland, Mass., 13 Sept. 1848; d. 18 Aug. 1916. Beside musical compositions he wrote 'The Birds' Calendar' (1894); 'Songbirds and Waterfowl' (1897); 'How to Name the Birds' (1898); 'Trees, Shrubs and Vines of Northeastern United States' (1903); 'A Complete System of Harmony' (1908); 'A Complete Method for the Organ' (1911); 'The Church Organist' (1913);

'The Beginnings of the World's Music' (1914); 'Rambler in Music Land' (1914).

PARKIN, George Robert, Canadian educator and author: b. Salisbury, New Brunswick, 8 Feb. 1846. He was educated at the University of New Brunswick and at Oxford University, England. While at Oxford he was associated with a number of men who later became leaders in the imperialist movement in England, and Parkin was credited with influencing them to a considerable degree. He returned to Canada, and in 1874-89 he was principal of the College School, Fredericton, meantime continuing his connection with the imperialist cause. In 1889 he discontinued his labors as a teacher in order to become a lecturer for the Imperial Federation League, in the interests of which he traveled throughout the empire. He became also Canadian correspondent for the London *Times*, laboring to secure a better acquaintance between Canada and England. He was principal of Upper Canada College, Toronto, in 1895-1902, continuing, however, his support of Imperialism. In 1902 he became organizer of the Rhodes Scholarship, and was considered in a large measure responsible for the successful execution of the plan. Author of 'Reorganization of the British Empire' (1882); 'Imperial Federation' (1892); 'Round the Empire' (1892); 'Life of Edward Thring' (1897); 'Life of Sir John Macdonald' (1907); 'The Rhodes Scholarships' (1912). He died at London, 25 June 1922.

PARKINSON, James, English physician and paleontologist: b. about 1755; d. London, 21 Dec. 1824. He was engaged in the practice of medicine at Hoxton in 1785, at which time he attended lectures on surgery given by John Hunter. He experienced some difficulties owing to his political activities and was the author of several publications on the affairs of his time. He made some valuable collections and notes on geology and paleontology; was a Fellow of the Royal College of Surgeons; and an original member of the Geological Society on its formation in 1807. He was author of numerous medical treatises but his most important works are 'Organic Remains of a Former World' (3 vols., 1808-11); 'Outlines of Oryctology' (1822).

PARKINSONIA, a genus of tropical trees and shrubs of the family *Cæsalpiniaceæ*. The species, of which there are less than 10, have short spines, bipinnate leaves, yellow or whitish flowers arranged in loose terminal or axillary racemes, and more or less twisted compressed pods. The best-known and most widely popular species is the Jerusalem thorn (*P. aculeata*). It is probably a native of America, but is cultivated throughout the tropics, in many parts of which it is naturalized. From its frequent employment for hedges and from its gorgeousness when in blossom it is often called the Barbados flower-fence. Its bark yields a white fibre which might be valuable for paper-making, but is rather weak and short for most purposes. It is fairly hardy in the Southern States and will thrive in the driest situations. As a greenhouse plant it is difficult to grow. *Parkinsonia torreyana* is a native of the Southwestern States where, like *P. microphylla*, it is known as "palo verde" from its green branches. Three species are natives of South America and one of South Africa.

Francis Parkman

PARKMAN, pàrk'man, Francis, American historian: b. Boston, 16 Sept. 1823; d. there, 8 Nov. 1893. He prepared for college at Chauncey Hall School, in Boston, entered Harvard in 1840 and was graduated in 1844. During his college course he determined to write the history of the struggle between France and England for the possession of the New World, but kept his purpose a secret. In college he gave particular attention to history and literature, and attained considerable distinction as a historical student. On his vacation trips also he visited many of the localities of which he was afterward to write, and studied the life of the Indians of Maine. He kept diaries of all these excursions in which he recorded in detail his observations and impressions. After leaving Harvard he spent two years at the Law School but never entered upon the practice of law. Feeling the need for a fuller understanding of Indian character and life, he spent five months in the West, living among the Dakotas and other tribes. This gave him just the kind of first-hand knowledge he desired, but the hardships to which he was exposed undermined his constitution and brought upon him the weakness of the eyes and general ill health from which he suffered for the rest of his life. From that time he devoted himself to the completion of the work he had planned. He several times visited Canada and Europe, making a careful examination of the numerous manuscripts of the period concerning which he wrote and also studied closely life in several monasteries for the better comprehension of the spirit of monasticism and of Roman Catholic ecclesiasticism. From 1853 to 1863 his health prevented him from doing any historical work and at this time he gave his attention to horticulture, in which he was particularly successful; he wrote several valuable horticultural papers and 'The Book of Roses,' still a recognized authority. In 1868 he was overseer of Harvard, resigned this position in 1869 and became professor of horticulture; and in 1875-88 was a Fellow of Harvard. The courage and persistency with which he overcame the obstacles of ill health and ruined eyesight were truly heroic. Often he could work only a few minutes at a time; he had all documents and manuscripts read to him, taking as few notes as possible and dictated from his notes; yet he brought to full completion the great work he had planned. His first book, 'The Oregon Trail,' an account of his travels in the West, appeared in 1849; his one work of fiction, 'Vassall Morton,' in 1856. In 1851 he issued the 'Conspiracy of Pontiac,' and in 1865 'The Pioneers of France in the New World,' the first of the series 'France and England in North America.' The rest of the series appeared as follows: 'The Jesuits in North America' (1867); 'La Salle and the Discovery of the Great West' (1869); 'The Old Régime in Canada' (1874); 'Count Frontenac and New France under Louis XIV' (1877); 'Montcalm and Wolfe' (1884). This last concluded the series but left an important period untreated; the gap was filled by the publication of 'A Half Century of Conflict' (1892). Parkman chose for his subject a theme entirely untouched by other writers and dealt with it so successfully as to obtain pre-eminent rank among historians. His histories are not philosophical,

yet are written with a breadth of view and a sense of proportion that mark the philosophic spirit. Nowhere does he show his power more clearly than in his sympathetic and vivid portrayal of many widely different characters. He combined to an unusual degree the merits of both the scientific and literary historian. None of the most scientific of modern historical students have surpassed him in thorough and exhaustive research, while his literary style is marked by a clearness, beauty and dramatic power that give to his histories the fascination of the best of romance. Consult Farnham, C. H., 'Life of Parkman' (Boston 1901); Sedgewick, H. D., 'Francis Parkman' (Boston 1904); Vedder, H. C., 'American Writers of Today' (New York 1910).

PARKS, Leighton, American Protestant Episcopal clergyman: b. New York, 10 Feb. 1852. He was graduated at the General Theological Seminary in 1876, was ordained deacon in that year and priest in 1877. He was rector of Emmanuel Church, Boston, in 1878-1904, since when he has held the charge of Saint Bartholomew's, New York, succeeding David H. Greer who resigned upon being elected bishop of the diocese. Author of 'His Star in the East'; 'The Winning of the Soul and Other Sermons' (1893); 'Moral Leadership and Other Sermons' (1914).

PARKS, Public. Cities as a rule are not sufficiently appreciative of the necessity and desirability of adequate park systems. They are usually satisfied with a few meagre, dust-covered squares, scattered throughout the business section, and certain large acreages in inaccessible locations, principally used for athletic and picnic parties. The park system of a city, however, necessarily receives the care and attention in its design and execution that is given to civic centres and other portions of the city. They are laid out in a broad spirit and with a free hand, and space should not be spared.

There is slight danger of planning parks on too large a scale, there having been few instances, if any, of cities having reduced the size of their parks, once laid out. At one time there was considerable criticism concerning the extent of Central Park in the city of New York, which is two and one-half miles long and one-half mile wide. To-day, however, the proposal to erect in it a building of the highest artistic character is vigorously opposed and public opinion would not countenance the slightest reduction in its area.

A modern system of a city is planned in a systematic manner. It should consist of parks of varying sizes and design, each adapted more or less particularly for certain purposes. In a general way, parks increase in size in proportion to the distance from the business centre, and for the purposes to which they are to be devoted they are grouped into four or five classes.

Those parks of the smallest size are generally located in the most congested parts of the city to relieve the pressure of business. They are not, however, so large as to have a disorganizing effect, or cause undue inconvenience to traffic and the dispatch of business. Those of the next largest size are, as a rule, in the crowded residential and tenement districts and they are of varying sizes, of from one to four

blocks, or more, in area. Those of the third class are located in the outskirts of the residential portion and are usually of great extent. These are the principal parks of the city and are connected by boulevards and parkways. The fourth and largest class often consist of large undeveloped areas of land, purchased by the city and rented out partially for farming purposes and partially held as forests, from which the wood may be cut and sold in such quantities as will not deplete its growth. From lands such as these latter, cities in many European countries derive large and increasing revenues, while portions of the land may be sold from time to time as the city grows.

The number of parks in a city should be large, particularly as regards the smaller ones. An important principle in park design is to have the number and location such that every portion of the city shall be within easy walking distance of at least one small park. As to location, they should be arranged as a part of a system and not merely set down haphazard and wherever room may be had. They afford excellent terminal points for streets and avenues, and, when made a part of a proper system, add unity and variety to a city's plan.

The larger parks should be connected by boulevards, or, for the sake of variety, water communications, either for pleasure purposes or commercial use. If the waterways are for commercial use, they should be laid out with grass plots and lined with boulevards, as is the usual custom abroad.

The properties best adapted for park purposes are often of the least value for other uses. Steep hills, cliffs or rock formations, swamps, ponds, lakes and streams render land expensive for utilization as building sites, but, on the contrary, supply the natural features most easily transformed into interesting parks.

Small parks may be either of a strictly formal nature, or laid out on a more or less rural plan, with cascades, flower beds and an abundance of trees. Running water is always a feature of interest, but stagnant water should not be permitted, as being a breeding place for mosquitoes, which are likely to become a great nuisance.

Most large foreign cities are abundantly supplied with small parks. Berlin has a large number, as has Vienna, but in the latter city there is an arrangement known as the "Ring," which adds to the effectiveness of the parks. Dresden and Stockholm also have a large number of small parks. In addition, in certain foreign cities, there are spacious squares, which, though devoid of grass, shrubbery or trees, still have to a certain extent the effect of parks, being embellished with fountains, obelisks, monuments, electroliers, etc. A well-known example of this latter is the Place de la Concorde, Paris, which, however, is bounded on two of its sides by parks; others are the Raadhus-Plads, Copenhagen, the eastern end of Unter den Linden in Berlin, the Dam in Amsterdam and the Place de l'Hôtel de Ville in Paris. Owing to the traffic passing through them, they are necessarily open.

If these open spaces are too large, they have the effect of dwarfing the surrounding buildings. Such is the case in certain squares found in Moscow and in Petrograd in the Place Dvort-

sory, the Place Krasnaia and the Place des Théâtres, which are merely large open spaces paved with cobblestones. While these spaces could have been laid out as parks with trees and grass plots, it may be that they have remained open as spaces for possible military parades.

One of the most important features of a park system is accessibility. The greatest attention should be paid to so arranging the parks and transportation lines that the public may be provided with quick, cheap and convenient means of access to the parks, for otherwise they lose the greater part of their usefulness.

Every city as a rule should have at least one large park within easy walking distance of a considerable part of its population and the other parks within easy reach by surface or other lines of transportation at a single fare. River and island parks are reached by bridges or by boats operated by the city. If transportation facilities to the parks are not ample the parks are of little use. The greater part of the city's population labors six days a week, with but few opportunities for recreation other than on the seventh day; much effort is being made to afford on that day all possible facilities for the needed recreation.

In character, the parks of a city should be varied; those of small size, surrounded by buildings of architectural interest, should be of a more formal character, that is, laid out on a more regular plan, with walks, terraces, avenues, lakes, fountains, flower beds, statuary, ornamental electroliers and other features of a similar sort than those situated in more distant portions of the city. The latter are preferably of a more rural character, primæval and undisturbed in general effect. The main park of the city may partake of both these characteristics, portions being adapted to the one scheme and other portions to the other. In its appeal to its multitudinous users, they contain features calculated to appeal to the tastes of each and all seeking recreation.

The entrances to such a park have generally a monumental character and often have a central mall, laid out in a formal manner and flanked with statues. Promenades and walks, large flower beds, botanical gardens, zoological gardens, lakes with aquatic birds, facilities for rowing in summer and for ice skating in winter, artificial geysers, small streams and rivers with artificial falls, rock formations, bypaths, music stands, summer-houses, shelter-houses, drinking fountains, refreshment stands, concert pavilions, tennis and croquet grounds, wading pools for children, playgrounds with swings, carousels and the like, sun-dials, ornamental bridges, free singing birds, squirrels and other small animals, driveways, bridle paths, reservoirs, observation towers, decorative kiosks and other features all go to make such a park attractive to visitors of all classes. The foregoing indicates the arrangement and location of parks, while the following give some concrete examples of parks in certain representative cities. For example, the city of Berlin has been laid out and its development planned up to the year 2000, when, it is estimated, the city will have a population of 10,000,000. With 4,000,000 inhabitants at present, Berlin is the third largest city in the world. Before its suburbs—

PARKS

1 The Fountain, Central Park, New York

2 Lake Alvarado, Golden Gate Park, San Francisco

the principle of which are Charlottenburg, Schöneburg, Rixdorf and Wilmersdorf—were incorporated in it, its population was 2,091,000, and the area of its parks was as follows:

Nine parks, covering 776 acres; 147 small decorative plots, 254 acres; three tree nurseries, 42 acres; one school garden, 74 acres; a total of 1,146 acres. In addition, the length of streets planted with trees is 106 miles. Around the trees are 262 garden plots having an aggregate area of 237 acres. There are also 99 acres of grass plots utilized as children's playgrounds, ranging in size from $\frac{1}{4}$ to 17 acres each.

The park area of Charlottenburg (pop. 309,400) on 31 March 1912 was 618 acres. On the same date the total area of the city was 5,790 acres. In addition to its parks proper, the city maintains four tree nurseries in which 174,000 young trees were growing at the end of March 1912. At the same time the municipal greenhouses contain 87,885 flowering plants, 1,399 palms and 2,408 decorative plants, of an aggregate value of \$10,460. During the course of the year 456,643 plants, worth \$27,000, were used in the parks, in the street boulevarding and about the schools, hospitals, etc.

Berlin-Schöneburg possesses its own municipal gardens, covering 50,000 square yards, which, when entirely completed, will comprise 11 greenhouses, 125 hotbeds, a botanical section intended to supply schools with demonstrative specimens and a municipal free nursery. On the average, 300,000 plants, including about 50,000 bulbs, are used each year for setting out in the city flower beds. The park commission's budget for the fiscal year 1913-14 amounted to \$72,195.

Great attention has been paid throughout Germany to the subject of parks, not alone within the cities, but also without, certain municipalities owning from 10,000 to 40,000 acres, which, considered from the standpoint of forest conservation, bring in a steady and ever-increasing income. In fact there are instances of certain cities, instead of collecting taxes, paying dividends to their citizens each year out of the proceeds derived from their lands and other municipal owned utilities.

Within Greater London the total park area is approximately 17,800 acres, of which the 17 government parks comprise 56,857 acres, the 13 city parks, 6,491 acres, in addition to the suburban parks, of 5,057 acres and the borough parks, of 266 acres. The principal parks are Victoria, with 250 acres, Battersea, 200 acres, Hempstead Heath, 250 acres. The last named is a high tract of land lying in the northwestern part of the city, with few artificial features. Besides these there are four royal parks, Saint James, Green, Kensington Gardens and Hyde Park, the best known being the last named, the rendezvous of high society and royalty, particularly during the spring and summer months. Kensington Gardens is a veritable arbor, trees, shrubs and flowers from every clime being found on every hand. Other parks are Putney Heath, Regent's Park, Richmond Park, on the Thames and the numerous small squares and open places, many being around churches. The total upkeep is approximately \$600,000 per annum for the entire park system.

The parks of Paris are divided between those within and those without the fortifications, the

latter being found in all directions at varying distances up to Forests of Fontainebleau, covering between 40,000 and 45,000 acres, which, although over an hour's ride from the city, is claimed with pride by every Parisian. Of the parks within the city, the most famous is that of the Tuileries (56 acres), overlooking the Seine on the right side, and, therefore, being on the line dividing the city. Formerly the grounds of the royal palace, the Tuileries have seen many vicissitudes. To-day they are the property of the French Republic, the only park in Paris so owned. At one end is situated the famous Paris art museum, the Louvre, and at the other, in the Place de la Concorde, is the beginning of the Champs Élysées, the famous parked boulevard extending northwesterly to the Arc de Triomphe. To the right is one of the fashionable shopping streets, the Rue de Rivoli. The arrangement of the park is rather formal, the embellishments, semi-classical sculpture, monuments, etc., being in keeping with the architecture of the palace of the Tuileries and the Louvre. Its central location makes it exceedingly popular, particularly for the working people employed in its vicinity.

Another park of the same size is the Luxembourg Gardens, situated around the palace of the Luxembourg. Less formal, and filled with many objects of historic interest, it is a favorite spot with the student population of the "left bank" of the Seine. Other interior parks are the aristocratic Parc Monceau (23 acres), filled with examples of the finest French sculpture and completely timbered; Montsouris Park (38 acres), with its meteorological observatory; Jardin des Plantes (58 acres), with its botanical treasures; and the Buttes-Chaumont Gardens (57 acres), formerly the gallows field of the city, reclaimed in 1865 for park purposes, has become one of the most attractive spots in the city.

Outside the fortifications is the Bois de Boulogne (2,100 acres), a natural wooded park with lakes, running streams, winding roadways and two race tracks. The Bois, as it is known, is the aristocratic afternoon park of the city, and here and on the Champs Élysées on the way to the Bois may be seen everyone who considers himself of any importance. On the opposite side of the city is the Bois de Vincennes, a similar park of the same size. While its natural features are much the same as the Bois de Boulogne, it is somewhat less accessible and less popular. There are two other parks, among the many that surround Paris, that have a particular attraction for visitors—those at Saint Cloud and at Versailles. Both were formerly the seats of French royalty. The latter, taken in connection with the palace, is a striking example of the geometrically formed park, which, if split in two in the centre and one-half superimposed over the other, is supposed to show an absolute bilateral similarity. It is divided by a Grand Canal. The principal attraction is the playing of the great fountains, which, on account of the great cost—upwards of \$2,000 per day—takes place once a month during the summer, and, in addition, the numerous objects of historical and romantic interest, for it was here that the French court had its greatest splendor.

In the city of New York are many notable

parks, the best known being Central Park (840 acres), situated in the practical geographical centre of the borough of Manhattan, New York City proper. It was purchased for park purposes, plans were worked out and development was begun between the years 1853 and 1863, work being begun in 1857. It extends from 59th to 110th street and from 5th to 8th avenues, and is situated conveniently to all the principal car lines of the city. It is wooded in part, with a large number of foreign trees and shrubs, and has a series of winding roads, paths and by-ways from one end to the other. Besides its natural features it has many additional attractions, for instance, a "Zoo," which is visited by thousands every year, a greenhouse wherein are exhibited splendid examples of exotic plants, and in which flower shows are sometimes held. A large lake, ponds and running streams are other of the attractions, and facilities for rowing in summer and skating in winter are provided. Of permanent value the year around as a place much visited is the Metropolitan Museum, situated on the 5th avenue side, and the American Museum of Natural History, located just outside on the western side. Two city water reservoirs, an obelisk, a Revolutionary fort, the "Mall," with its concert stand, and many monuments are other points of interest. It is cut by only one cross street (having a car line), but the street is below the surface of the park and properly bridged over.

The land included in Central Park cost originally \$5,028,844. In 1906 its value was estimated at \$236,500,000, and to-day it is worth probably over half a billion dollars—an example of the reason for which European cities make it a rule to buy parks and lands for speculative purposes.

Other parks are Pelham Bay Park (1,756 acres) with a shore front of upwards of 10 miles, along Long Island Sound, and two islands; Bronx Park (719 acres), containing the New York Botanical Gardens and the Zoological Park, the most important of its kind in the country. Bronx Park, with its natural woods and other features, including a river, spacious boulevards, etc., is a favorite spot with thousands of persons from the lower "East Side" of New York City, as the lines of communication run direct. Van Cortlandt Park (1,132 acres), on the Hudson River side of the city, is the favorite public recreation park of New York, particularly so for golf, track and other outdoor sports, including skating.

Brooklyn contains several notable parks: Prospect Park (516 acres), the site of the Revolutionary battle of Long Island. The effort of its sponsors has been to keep it as nearly in its natural condition as possible, and entire freedom is given to children to play in any part. In particular, it contains a "Parade" of about 40 acres for athletic sports; Dyker Island Park (144 acres), overlooking the Narrows; Bay Ridge Park, overlooking New York Bay; Forest Park (535 acres), adjoining Queensborough, filled with natural attractions for the lover of outdoor life; and Fort Greene Park (30 acres), around the site of the Revolutionary fort of the same name. In Staten Island is Silver Lake Park (300 acres), well laid out with drives, tennis courts, etc.

Both in New York and in Brooklyn are innumerable smaller parks—breathing spaces—

and between certain of the parks are connecting boulevards of note, timbered and parked, from 200 to 400 feet in width. The most noted of these perhaps is Riverside Drive and Park, extending from 72d street northward along the Hudson River. It follows the natural contour of the littoral, and is flanked on one side by some of the handsomest residences and apartment-houses of the city, and on the other by the river bank with its primæval timber. Unfortunately, access to the water's edge is difficult, as the New York Central has the right of way, but plans are being formulated for the bridging over of the tracks so that park purposes may not be interfered with.

Philadelphia is well supplied with parks, the most beautiful being Fairmount (3,242 acres), and Wissahickon Driveway on the Schuylkill River. The city park commission in 1888 formulated plans for the systematic improvement and addition of the park system, so that now within a radius of 25 miles from the city hall there is an area of upwards of 8,500 acres devoted to this purpose, including open spaces, river fronts, boulevards, etc.

Boston has perhaps the most complete system of parks and playgrounds in America; in fact, the modern playground and recreation-park movement may fairly be said to have had its beginnings for Americans in Boston. The city stands at the head of those communities which have actually achieved their aims in this direction. There are within the city 3,574 acres of land devoted to park and playground purposes, over one-tenth of the total land area of the city. Of this area, 2,692 acres are under the control of the city and 882 acres under control of the State. The Common with an area of 48 acres, and the Public Garden, with an area of 24 acres, lie almost at the centre of the city. No district is without its park or playground, no part of the community without an easily accessible breathing spot. A State-appointed Metropolitan Park Commission has developed in the environs of the city a supplementary system of parks. North of the city lies the Middlesex Falls Reservation, containing over 3,000 acres of hills and woodland. To the south lies the Blue Hills Reservation of 4,232 acres. The banks of the Charles River and the ocean beaches are included in the general scheme and all the larger units are joined by means of a system of well-kept boulevards. Education features are provided at the Marine Park, the Franklin Park Zoo and the Arnold Arboretum.

Baltimore, 2,277 acres, the best known being Patterson Park, Carroll Park and Druid Hill; Chicago has a system whereby within 10 minutes walk one can find a park. In size they run from 3 to 75 acres. The best known are Lincoln Park, Washington Park and Jackson Park, the last named being the site of the World's Columbian Exposition, 1893. In general the lagoons for which the exposition was famed have been left, and are now a veritable network of waterways. The park commission of Chicago has endeavored to combine its parks with the idea of recreation, and probably the most nearly complete system in the country is the result. Washington, the Federal capital, has a well-developed park system, including Potomac Park, Lincoln Park, Meridian Hill Park, Logan Park, Garfield Park. The Military Park of Newark, N. J., is well developed

as also Battery Park of Charleston, S. C., Gordon Park, Cleveland, is becoming one of the show places of that city. Garden City, Long Island, and Forest Hills a few miles distant are among the most interesting modern civic developments in America from the point of view of the park and landscape architect. Akron, Ohio, has a fine public playground and rest spot in Perkins Park. Grant Park, Atlanta, Ga., has undergone considerable improvement and has many features of interest. Saint Augustine and Jacksonville, Fla., have very interesting parks with sub-tropical plants and trees of great interest to visitors from the bleak North. Belle Isle, Detroit, ranks among the best developed public parks in the United States and Washington Park, Albany, N. Y., is also among the best developed civic park areas. Seaside Park, Bridgeport, Conn., has great natural advantages, being located on the Atlantic shore; it has undergone considerable improvement in recent years and is among the more noteworthy developments in park design and maintenance. Keney Park and Elizabeth Park, Hartford, Conn., are noted for their scenic and floral beauty.

The foregoing are examples of parks for large cities. Smaller cities as a rule in the past have done comparatively little to provide parks and recreation grounds. However, with the introduction of modern city planning, numerous American cities are now providing park systems previously not dreamed of, for instance, in a comprehensive city planning report for Bethlehem, Pa. (65,000 population), plans were prepared for a chain of parks, boulevards and recreation grounds which may be considered adequate and serve as a good example for a city of this size. The several parks developed and now under development are, Monocacy Park, Sand Island Park and Lehigh River Park within the city limits, and Saucon Park just outside of the city limit but within the jurisdiction of the city planning commission.

FRANK KOESTER,

*Consulting Engineer and City Planning Expert;
Author of 'Modern City Planning and
Maintenance.'*

PARKSVILLE, Mo., village in Platte County, 10 miles northwest of Kansas City, on the Missouri River, and on the Chicago Great Western and the Chicago, Burlington and Quincy railroads. Park College was founded here in 1875. There are stone quarries and it is a shipping point for willows for riprapping. Pop. 765.

PARLEMENT, in French history, before the Revolution, a name applied to certain superior and final courts of judicature, in which also the edicts of the king were registered before they became laws. Of these the chief was that of Paris, but there were no fewer than 12 provincial parlements, at Toulouse, Grenoble, Bordeaux, Dijon, Pau, Metz, Besançon, Douai, Rouen, Aix, Rennes and Nancy. These, though not actually connected with that of Paris, invariably made common cause with it in its struggles with the royal power. Of these parlements the most celebrated, most influential and historically, most interesting, was that of Paris. It dates back to the Curia Regis of the Frankish kings. The former assembly was composed of

the dignitaries of the court (lay and ecclesiastical), who were accustomed to meet at the call of the king and under his presidency, or that of some one appointed by him, to act for him. Thus, in its origin, the parlement of Paris was a distinctly royal council. As such it looked after all cases involving the royal interests. In addition to this it heard appeals from the lower courts, especially where denial of justice or unnecessary delay was charged. On account of its royal origin it became, especially under the Carolingian rulers, the court in which the higher nobility and those connected with the king's household were tried. Its functions were also extended, more broadly, to those living under the protection of the sovereign. These various functions threw upon the parlement an amount of work very much greater than had originally been intended it should have to perform. Gradually this work was systematized and divided into three distinctly defined sections, known as (1) Conseil de Roi; (2) Chambre des Comptes; and (3) the Parlement proper. Notwithstanding these divisions, the parlement continued to be composed of the nobility up to the reign of Louis IX, in the 13th century; but by this time the three divisions above indicated had become very definitely defined. In the reign of Philip IV (1285-1314) the upper bourgeoisie began to be represented in the parlement which already consisted of three chambers, the "Grand' Chambre," or the meeting of the parlement as a whole; the "Chambre des enquêtes," a sort of committee of the Grand' Chambre, which took charge of preliminary investigations of all kinds and handled a vast amount of detail work, which could more easily be taken care of by it than by the parlement as a whole; and finally the "Chambre des requêtes" which, as its name indicates, handled all petitions made to the parlement. During the occupation of Paris by the English (1417-36) the parlement of Paris continued to meet and transact its business regularly at Poitiers.

The French parlement can scarcely be called a parliament in the English sense of the word, because it never really ceased, theoretically at least, to represent the interests of the sovereign. The members were appointed by the king, sometimes on his own authority and to represent his own interests, but generally, especially from 1400 onward, from a list of eligibles presented by parlement. Thus no one could become a member of parlement who was displeasing to the king or who was known to oppose his interests. But gradually the principle of nomination became a dead letter and by the reign of Francis I membership in the parlement was openly purchased. This, combined, with the fact that in the reign of Louis XI (1467) the irremovability of the members had become a fixed principle, tended to rapidly make of that body a "nobility of the robe," which, as it grew in power, became excessively jealous of its own prerogatives and determined on strengthening its own position. Membership in the parlement began to pass from father to son as the order and rank of nobility. The sovereigns aided these pretensions by creating new members of parlement and collecting large sums from them for the favor of the appointment. In 1604 an arrangement was reached between the members of the parlement and the king whereby the

former paid into the royal treasury one-sixtieth of their income in return for the royal confirmation of the principle that their parliamentary office should, at their death, pass to their heirs. The growth of power and importance of the parlement naturally soon began to make it look more to its own interests than to those of the sovereign. As early as the reign of Louis XI it began to endeavor to modify the royal decrees or to change or reject them, and the king's confirmation of the irremovability of the members was really a concession to their growing power and ability to oppose the royal will. From this time on a quiet struggle for power continued between the parlement on the one hand and the various sovereigns of France on the other, until finally in the reign of Louis XIII, the parlement sought to impose its will upon the king and upon his Minister, Richelieu, but failed in the attempt, thanks to the ability and determination of the latter. In the reign of Louis XIV the struggle was continued, and again the parlement finally lost out, and in the end found its powers greatly restricted, everything but its judiciary functions having been taken from it. This placed the parlement in the position of an antagonist attempting to gain from the Crown the powers and privileges of which it had been deprived. In 1771 the parlement was dissolved, all offices declared vacant and a new parlement created with restricted powers and emoluments. At this time provision was made for doing much of the judicial work of the parlement by the establishment of six superior courts, a really good and sound legal and legislative move, but one that was naturally very unpopular with the would-be ruling class, who composed the old parlement, and with the people as a whole, who sided with the members of the parlement rather than with the Crown, whose acts were considered arbitrary and illegal. This brought the parlement and the people closer together and tended continually to widen the breach between the former and the Crown. Thus the parlement, though in the beginning it had no object in opposing the sovereign other than the securing of its own individual interests, became logically the champion of popular rights and the will of the people as opposed to the autocratic power of its rulers, who were not slow to recognize the position into which the parlement had drifted. Rapidly the parlement became the emblem of widesweeping reforms in the government of the nation and the rights of the people. Had the parlement really been representative of popular interests it might have had a different influence on the history of popular rights in France; but it was all along bent on recovering its old privileges and powers and had little or no interest in the claims of the masses, which it bitterly opposed whenever any reforms were advocated that tended, in the interest of the general public, to restrict or curtail in any way its ancient privileges and emoluments. Finally, in 1790, the parlement of Paris and also all the provincial parlements were abolished by the National Assembly, who found that they were bent on looking after their own interests as privileged bodies, as opposed to those of the French people as a nation.

The chief importance of the parlements of France is to be found in the fact that they acted as practically national judiciary bodies at

a time when the presence of such bodies was necessary for the safety of the nation. On account of their practical unity of aims and the close contact of the provincial parlements with that of Paris and with one another, they gradually unified the customs laws of France so that they obtained practically the force of one great body of written laws and laid the foundation of French law, which was built, for the most part, on justice and right.

PARLER, or **ARLER**, **Peter**, German architect: b. probably Cologne, about 1333; d. about 1397. He was a son of Heinrich Parler, also a famous architect of Cologne, and brother to Johannes Parler, who in 1359 became master architect of the cathedral of Freiburg. The name is thought to be corrupted from Arler, and members of the family were known also as Von Gmünd, from the birthplace of Heinrich and others of the family connection. In 1356 Peter was architect on the Prague Cathedral, of which he is known to have built the choir. The members of the family are listed in Klemm's 'Allgemeine deutsche Biographie.' Consult also Neuwirth's 'Peter Parler von Gmünd und seine Familie' (Prague 1891).

PARLEY, **Peter**. See GOODRICH, SAMUEL GRISWOLD.

PARLEY, military term, designating an oral conference with the enemy. It takes place under a flag of truce and usually at some spot, temporarily neutral, between the lines of the opposing armies. The advance of the messenger is usually announced by sound of trumpet or beat of drum as well as by the signal of the white flag of truce. The messenger chosen is designated as a "parlementaire," a term used by all nations, including Great Britain and the United States. The parlementaire becomes the agent of all non-hostile intercourse between belligerent armies, his duties covering every form of communication between the opposing armies. He may be accompanied by three persons, usually a drummer, bugler or trumpeter and an interpreter. These persons, however, may not enter the enemy's lines; and the parlementaire may not demand reception by the commanding officer, but must, if requested, deliver his written message or put an oral message into writing to be delivered to the commander. The party advancing under a flag of truce is not to be fired upon, but on the other hand is supposed to select a quiet period and avoid recklessness in his advance, and if

he advances under heavy enemy fire and is injured he has no cause for complaint; nor may a truce party advance at night. The party sending the parlementaire ceases firing as an announcement of sending a truce party, further announcement being made by "beating a parley" with trumpet or drum. The commander of the enemy army may not refuse to receive the message of the parlementaire, but he may declare formalities and conditions under which he will receive him and fix the hour and place at which he must appear. Unnecessary repetition of visits need not be permitted and in case of abuse of the white flag the commander in reprisal may refuse to receive the truce party. The parlementaire and his escort are inviolable except when he abuses his privileges in an effort to obtain information or other advantage. In such case he may be detained but word must be sent to his commanding officer and his detention must be of as brief duration as is consistent with safeguarding the secrets he has secured. The rules are clearly defined in the 'Rules of Land Warfare, Annex to Hague Convention No. iv, 18 Oct. 1907.' Consult 'Rules of Land Warfare, United States Army, 1914' (War Department, Washington 1914).

PARLIAMENT, Houses of. See LONDON.

PARLIAMENTARY ELECTIONS ACT. See CORRUPT PRACTICES ACTS.

PARLIAMENTARY LAW, the system of rules, practices and customs which regulate the procedure of deliberative assemblies, often referred to as rules of order, and deriving its name from the British Parliament, where the first complete system of procedure was evolved. Assemblies differ both in their character as legal or voluntary and also in the nature of the right of membership. Individual assemblies often have special rules which are called standing rules. While the rules of procedure of deliberative assemblies may, and do, vary greatly in detail, there are, however, four principles common to all on which parliamentary law is founded. These are: (1) justice to all; (2) consideration of one proposition at a time; (3) majority rule; and (4) the safeguarding the rights of the minority. The will of an assembly is the will of a majority of its members; this is the deliberate will and forms the cardinal principle of parliamentary law. The chief officer of an assembly is variously termed chairman, president, speaker, etc. His office is to direct the business and apply all the rules impartially. Other officers are usually a vice-president or vice-chairman, secretary, treasurer, etc. Members of an assembly meet on an equal footing and it is incumbent on all to have the business of the meeting transacted according to the rules, special or general, governing such assembly. Business is introduced by a motion or resolution made on the floor by a member who has arisen, addressed the chair, and secured recognition from the presiding officer. Such motion or resolution must be seconded by another member; it is thereupon stated by the

presiding officer after which it is deemed to be in the possession of the assembly for debate. Members now may take the floor in turn but it is the province of the chair to make them confine their remarks to the question before the house. A member may speak a second time on the same question only after all other members who wish to speak have spoken once. The judgment of the assembly on a proposition is determined by voting either by ballot, by ayes and nays, or by yeas and nays. The two modes last named are *viva voce*. In the yeas and nays method the secretary calls the roll and records the vote of each member as he responds. The chairman votes when the voting is by ballot and in other cases generally only when his vote can change the result.

Motions or resolutions fall into four main groups: (1) those that are never in order except when there is no other business before the house, of this class are motions to rescind or repeal and the motion to expunge from the record; (2) the so-called subsidiary motions or motions made to dispose of or modify other motions or to cut off debate. These subsidiary motions are given below in the order of precedence from the weakest to the strongest; any of these may be made while one or more above it in the list are pending but may not be made if one below it in the list is pending. If four such motions were pending in addition to the principal motion which they are designed to modify, the one last made is the first to be voted on. The list of subsidiary motions follows: (a) To postpone indefinitely; (b) To amend (of equal rank with a to which it does not yield); (c) to refer to committee; (d) to postpone to a certain time; (e) to move the previous question (the effect of which is merely to shut off debate and bring the question to a vote); (f) to lay on the table (the effect of which is an indefinite postponement). The question may be taken up again when there is no other business before the assembly by a motion to take from the table. (3) The incidental motions form the third group and arise out of questions, main motions or rules. All require a majority vote except suspension of rules which requires two-thirds. The incidental motions are: (a) To withdraw a motion; (b) to read papers or documents; (c) to suspend rules; (d) the question of the consideration; (e) a point of order (by which a violation of rule is pointed out). In such case the chair decides the point; an appeal from his decision does not lie in cases where the rule states plainly the course of action to be pursued; (f) motion to reconsider. (4) Privileged motions constitute the fourth main group. They deal with the needs of the assembly. They prevail over all others and among themselves the order of precedence is as given below: (a) call for order of the day; (b) questions as to privilege; (c) to take a recess; (d) to adjourn. (5) To fix the place or date for reassembling. Consult Cushing, L. S., 'Rules of Proceeding and Debate in Deliberative Assemblies' (Philadelphia 1914); Gregg, F. M., 'Handbook of Parliamentary Law' (1910), a veritable mine of information on its subject; Fox, E. A., 'Parliamentary Usage' (1902); Hinds, A. C., 'House Manual' (1909); Reed, Thomas B., 'Manual of General Parliamentary Law' (1898); Roberts,

H. M., 'Rules of Order' (1904); Waples, R., 'Handbook of Parliamentary Practice' (1901); Pardo-Suarez, 'Practicas parlamentarias.'

PARLIAMENTARY REFORM. See GREAT BRITAIN—THE POLITICAL PARTIES.

PARMA, pâr'mă, **Alessandro Farnese**, 3d DUKE OF. See FARNESE, ALESSANDRO.

PARMA, Italy, the capital of the province of the same name, on the Parma, which divides the city into unequal parts; Parma is 55 miles by rail northwest of Bologna. The town is encircled by the Rampari, a promenade laid out on the site of the former fortifications. The old Roman Via Æmilia traverses the town centrally east to west, forming the principal street, at its widest section named Corso Vittorio Emanuele; and the Strada Garibaldi, another important street, intersects it north and south. Both are laid with tramways. Of the four principal squares the chief is the large and handsome Piazza Grande, near the centre of the town. Among the principal buildings are the Duomo or cathedral, begun in 1058, partly Romanesque and partly Gothic, with a fine octagon tower and a dome in the centre, the interior painted in fresco by Correggio; the baptistry, in the Lombard-Romanesque style (1196-1270), and covered externally with curious bas-reliefs; the church of La Steccata; the church of San Giovanni, which, with other churches and buildings, contains paintings by Correggio and by Parmigiano, the latter of whom was born there and both of whom lived there. Other buildings and places of interest are the ducal palace (now the prefecture); the Palazzo della Pilotta, comprising a museum of antiquities, a gallery of valuable paintings, and library of over 320,000 volumes; and the university founded in 1512, with faculties of law, medicine and science, 42 professors and over 600 students. The chief manufactures are of silk, cottons, woollens, felt hats, etc. Traces of a prehistoric pile-village of the Bronze Era and of an Etruscan town, precede the authentic history of Parma as a Roman colony. Pop. about 54,000. **PARMA**, the province, has an area of 1,250 square miles, and population of about 300,000. It is watered chiefly by the Taro, the Parma and the Enza, all of which fall into the Po. It is covered by branches of the Apennines on the south.

PARMENIDES, pâr-mên'î-dêz, Greek philosopher, head of the Eleatic school; b. Elea, in southern Italy, and flourished about the middle of the 5th century B.C. In 460 he went to Athens, with his pupil Zeno, and made the acquaintance of Socrates, then a young man. He was held in high esteem by both Plato and Aristotle for the depth of his intellect and the loftiness of his character. His only writings consist of a didactic poem, 'On Nature,' in epic verse, composed in the Ionian dialect.

PARMENIO, pâr-mē'n'î-ō, or **PARMENION**, Macedonian general under Philip and Alexander the Great; b. about 400 B.C.; d. Ecbatana, 329. A trusted counsellor and able lieutenant of Philip, he carried to a successful issue many campaigns during his master's life. In 356 he defeated the Illyrians; and in 342 carried on a successful campaign in Eubœa. While he was on a war mission in Asia Minor, Philip was assassinated; and Parmenio used his influ-

ence in behalf of Alexander whose accession was thus assured. Alexander also had great confidence in him, although deprecating the conservative prudence of the older man. While Parmenio was in Media, his son, Philotas, was found guilty of treason against Alexander and executed, and soon after his execution the father, too, was put to death; either because Alexander feared that he would attempt to take vengeance for the death of his son, or because the son implicated him in the plot.

PARMIGIANO, IL. See MAZZOLA, FRANCESCO.

PARNAHYBA, pâr-nă-ê'bă, a river of northern Brazil. See PARANAHYBA.

PARNASSUS, pâr-nă's'ûs, in ancient geography, a mountain in Phocis, near the Gulf of Corinth and the frontier of Boeotia and Attica. To the northeast lies the plain of Cephissus, to the west the plain of Amphissa, to the south two narrow valleys. The site of Castalia, a fountain of inspiration and of the temple of the Delphic Apollo (on the southern slope), Parnassus has become a symbol of poetry and *belles-lettres*. The name Parnassus is also given to the whole range of mountains.

PARNASSUS, Pa., borough in Westmoreland County, on the Allegheny River, 17 miles northeast of Pittsburgh, on the Pennsylvania Railroad. It is situated in a region devoted to agriculture, lumbering and coal mining, and has glass works, white lead and linseed-oil factories, and manufactures car equipment. Pop. 2,578.

PARNELL, pâr'nêl, **Charles Stewart**, Irish political leader; b. Avondale, County Wicklow, 27 June 1846; d. Brighton, Sussex, 6 Oct. 1891. He was educated at Magdalene College, Cambridge, which he left without a degree. In 1872-73 he visited the United States, and in 1875 was elected to Parliament as member for County Meath. He allied himself with Joseph Biggar and began the policy of obstructing parliamentary proceedings, in order to bring pressure to bear on the government, and obtain concessions for Ireland. In 1879 he was chosen first president of the recently started Land League; he now visited the United States a second time to raise funds for the League, and was well received by even the most extreme of the Irish party. At the general election of 1880 he was elected for three Irish constituencies, but chose to sit for Cork, which he represented to the last. He now became the chairman of the Irish parliamentary party. The methods of the Land League, especially the system of "boycotting," warmly advocated by Mr. Parnell, and the general state of Ireland, led the Gladstone government to bring in a Crimes Bill and an Arms Bill in 1881, both of which were passed, but not till after violent opposition from the Parnellites in Parliament. A Land Act was passed in the same session, and as the government saw that an attempt would be made to thwart its operation, Parnell was arrested and lodged in Kilmainham Jail with several of his supporters. In reply to this a "No Rent" manifesto was issued, which caused the suppression of the Land League, but boycotting and crime continued. In the spring of 1882, by what has been called the "Kilmainham Treaty," Parnell was set at liberty, having

promised to lend some assistance in checking crime. In 1886 Gladstone definitely declared in favor of Home Rule, and gained the support of Parnell and his party; in that same year the Home Rule Bill was introduced, and after its rejection Parnell and Gladstone were in close alliance. In 1887 Parnell and others of his party were accused by the London *Times* of complicity with the crimes and outrages committed by the extreme section of the Irish Nationalist party. To investigate these charges a commission of three judges was appointed by the government in 1888, with the result that, after a great deal of evidence received from both sides, a report was laid before Parliament in February 1890, acquitting him of the graver charges against him; and he obtained £5,000 (\$25,000) damages in a suit for libel against the *Times*. In 1890 he was proved the guilty correspondent in the divorce case of Captain O'Shea, and afterward married Mrs. O'Shea. The affair, however, ruined his political career. The Irish party at first reappointed him their chairman, but shortly afterward a letter from Gladstone to John Morley was published stating that if Parnell continued to be leader it would be "disastrous in the highest degree to the cause of Ireland," which, of course, implied that the support of Gladstone and his party would be withdrawn from Parnell. He was then deserted by the great majority of his parliamentary followers, and the Irish priesthood made a determined stand against him. He by no means tamely acquiesced in this position of affairs, but fought vigorously to the last to maintain his position as leader of the Irish people, thus overtaking his strength and breaking down his health. Parnell as a speaker was reserved and dignified; he had an unusual knowledge of parliamentary law, which he used most effectively, and for a time he completely dominated his party, making it a force both respected and feared in English political life.

Consult Hansard, 'Parliamentary Debates' for 1875-91; Bryce, 'Studies in Contemporary Biography' (1903); Mahoney, 'Life of Parnell' (1886); McCarthy, Justin, 'A History of Our Own Time'; Moore, 'Parnell and His Island' (1887); O'Brien, 'Life of Charles Stewart Parnell' (1888); O'Connor, 'The Parnell Movement' (1890); O'Shea, K., 'Charles Stewart Parnell' (New York 1914); Sherlocke, 'Life of Parnell' (1887); 'Memorial Volume to Charles Stewart Parnell,' with a biography by Walsh (1892).

PARNELL, Thomas, Anglo-Irish poet: b. Dublin, Ireland, 1679; d. Chester, England, July 1718. He was educated at Trinity College, Dublin, took orders in the Church of England in 1700, and in 1706 was made archdeacon of Clogher. He was intimate with Pope, whom he assisted in his translation of Homer and wrote the essay prefixed to it, 'Essay on the Life, Writings and Learning of Homer'. (1715). In 1713 he was appointed prebend of the cathedral of Dublin through the influence of Swift, and in 1716 was made vicar of Finglas. He was the intimate and associate of the foremost English and Irish writers of his day, among them Gay, Arbuthnot, Pope and Swift. His poems were published by Pope in 1721 and in 1758 a second volume entitled 'The Posthumous Works of

Parnell' was also published. Consult Goldsmith, 'Life of Parnell.'

PAROCHIAL SCHOOLS. See PARISH SCHOOLS, ROMAN CATHOLIC.

PARODY, a literary composition in which the style, form or expression of dignified writings are closely imitated, usually in a humorous or satirical manner. Among English parodies the best are the famous 'Rejected Addresses of James and Horace Smith.' The term is also applied to burlesque musical works.

PAROLE (from the same term in French meaning "word"), a term used in law and in military affairs. In law, something done verbally or by word of mouth, in contradistinction to what is written; thus an agreement may be by parole. Evidence also may be divided into parole evidence and written evidence. (See EVIDENCE). (2) In military affairs, when a prisoner of war receives full liberty within certain limits on promising not to attempt to escape he is said to be on parole; or he may get leave to depart from custody on promising that he will return at the time appointed; or he may give his parole not to fight again during the continuance of the war. The release of prisoners of war on parole came into use with the disuse of the old custom granting the captor right to hold his captives indefinitely for ransom. At first it was only extended to officers in exceptional cases. Breach of parole is reckoned infamous in all civilized nations. The word parole is also used as a password; a word given out each day in orders by the commanding officer in camp or garrison, by which friends and foes may be distinguished. It is used as a check on the countersign. The parole is sent sealed in the form of an order to those entitled to it. It differs from a countersign in being given only to officers, or those who inspect and give orders to the guard. The Hague Conference of 1889 defined the conditions of parole and provided that prisoners of war may be liberated on parole only when their country so authorizes. If paroled each person so liberated binds himself, on his personal honor, to fulfil all the conditions of the parole; and his own government is in honor and duty bound to require of him no services in any way conflicting with his observances of the fulfilment of the conditions of his parole. If the government objects to the condition of the parole it should return to captivity the person so paroled. A person found bearing arms against the government by which he has been paroled, or against its allies, may be tried by military court in which case conviction usually means the sentence of death. Consult Higgins, A. P., 'The Hague Conference and other International Conferences' (New York 1909); Scott, J. B., 'Texts of the Peace Conference at the Hague 1899 and 1907' (Boston 1908); 'Instructions for the Government of the Armies of the United States in the Field'; Spaight, J. M., 'War Rights on Land' (London 1911).

PARONYCHIA, in botany, the name of a genus of plants of the family *Silenaceæ*, known popularly as the nailworts, or whitlow-worts. They are tufted herbs, distinguished as having no corolla, the flowers consisting of a five-parted calyx, five stamens and a pistil, sometimes five-parted. About 50 species are known, those of the United States being mostly per-

ennials. They are natives of the temperate and warmer regions, a very few varieties being found in semi-tropical localities.

PAROPAMISUS, pār-ō-pām'ī-sūs, the Greek name of a part of the Hindukush Range to the west of Kabul and forming the border of Kohistan. It has, in modern times, come to be applied, in a somewhat more restricted sense, to the watershed between Herat and the frontier of Russia, along the river Kushk which lies at an elevation of about 1,000 feet above sea-level.

PAROQUET. See **PARROT**.

PAROS, pā'rōs, an island of the Cyclades in the Greek Archipelago, four miles west of Naxos from which it is separated by a channel from four to six miles. It is nowhere more than 15 miles long or nine miles wide. It has a perimeter of 36 miles and an area of 82 square miles. In the centre of the island rises Mount Hagios (Helias or Saint Elias), to an altitude of about 2,400 feet. The summit of the mountain which occupies the entire island is largely composed of fine marble; the best variety, called "lychnites," were at one time much used in Greek statuary. The marble quarries are no longer worked, but the old roads to them are plainly to be seen. The fertile soil grows vines and grain. The capital city of the island Paros (now Parikia) was settled first by Cretans and then by Peloponnesians. Its people joined the invading Persian armies in 490 and 480 B.C. After Marathon, Miltiades (q.v.) attempted to reduce the city, but was unsuccessful. A year later, defeated by Themistocles, it entered the Athenian league. After the downfall of Macedonia the city came into the hands of the Ptolemies. In 197 it was restored to Athens by the intervention of the Romans; and half a century later became subject to Rome. The island was the birthplace of Archilochus. Pop. about 10,000.

PAROTID GLAND. See **SALIVARY GLANDS**.

PARQUETRY, ornamental inlaid wood-work, generally used for floors. Sometimes, however, wainscots, walls and even ceilings are paneled in parquetry. The designs are geometric patterns executed in differently tinted woods. Parquet flooring had long been in use in France but it became popular in the reign of Louis XIII. The rectangular designs used in parquetry are much larger than those used in marquetry (q.v.).

PARR, Catherine, English queen, sixth wife of Henry VIII: b. 1512; d. Sudeley Castle, 5 Sept. 1548. The daughter of Sir Thomas Parr, master of wards and controller to Henry VIII's household, she was well educated, and thanks to her wealth was married when a mere girl to Edward Borough, then to John Neville, Baron Latimer, who died in 1542; and, though apparently engaged to Sir Thomas Seymour, brother to Lady Jane, 12 July 1543, became the wife of Henry VIII. To her step-children, and not only to the young Edward VI, the heir apparent, to whom she may have been tutor, but to Mary and Elizabeth, who had been declared illegitimate and who, because of her influence, were restored to their rank as princesses, she showed tender love and great kindness. To her influence was due much of the love of

learning later shown by Elizabeth. She also did much to mitigate the severity of the six articles and to restrain Henry VIII from excessive cruelty against the recusants. The story that her life was endangered by a plot accusing her of heresy and that she assured the king that in matters of religion she had never argued with him nor objected to his remarks save to profit by his wisdom, thus saving herself and bringing discredit on the lord chancellor and her other enemies, may not be wholly free from additions and changes at the hands of Foxe, who tells it, but it is none the less characteristic. During the absence of the king at the siege of Boulogne she acted as regent (1544). A few months after the king's death Catherine married Sir Thomas Seymour, probably in April 1547. She died in September of the next year, a month after bearing him a daughter. Her purity, grace and learning made her a very attractive figure. She showed herself strongly interested in the universities and wrote several devotional works.

PARR, Louisa Taylor, English novelist: b. London, about 1848; d. November 1903. Her earlier years were spent in Cornwall, and in 1869 she was married to a physician and made her home in Kensington. Among her novels are 'How it all Happened' (1868); 'Dorothy Fox' (1870); 'The Prescotts' (1874); 'Gosau Smithy' (1875); 'Adam and Eve' (1880); 'Robin' (1884); 'Loyalty George' (1888); 'Dumps' (1891); 'The Squire' (1892); 'Can this be Love' (1896); 'The Follies of Fashion.'

PARR, Samuel, English classical scholar and clergyman: b. Harrow, Middlesex, 26 Jan. 1747; d. Hatton, Warwickshire, 6 March 1825. After two years at Cambridge University he became an assistant master at Harrow School, and in 1776 head master of Colchester School. Taking orders in the Established Church he became perpetual curate of Hatton, and in 1820 was appointed to a prebend's stall in Saint Paul's Cathedral. He possessed a wonderful memory, was a brilliant talker and esteemed a weighty scholar, but his reputation does not seem justified by his writings, which with a memoir by John Stone appeared in eight volumes in 1828. Consult also Field, 'Memoirs of Dr. Parr' (1828); De Quincey, 'Dr. Samuel Parr on Whiggism in its Relations to Literature.'

PARR, Thomas, or **OLD PARR**, English centenarian, supposed to have lived to be 152 years old: b. according to tradition, 1483; d. London, 14 Nov. 1635. His home was Winnington, near Shrewsbury; there he entered service in 1500, was married in 1563, and in 1588 (at 105) did penance in the church of Alberbury for incontinence. He married again in 1605, and in 1635 was sent as a "piece of antiquity" to court by the Earl of Arundel. The change of air killed the old man. It is more than dubious that the tradition as to Parr's age is correct. The story in its popular form is given in John Taylor's 'The Olde, Olde, Very Olde Man' (1635). Consult *Fortnightly Review* (London April 1869), 'Sir G. C. Lewis and Longevity.'

PARRAL, pār-rāl', **HIDALGO DEL PARRAL**, or **SAN JOSÉ DE PARRAL**, Mexico, city of the state of Chihuahua, a little

more than 120 miles southeast of Chihuahua. Its wealth is in its silver mines, which have been worked for years and are now run by American capital; the old mines, Jesús María, Mina, Prieta and Tajo, are in the centre of the city; seven miles northeast of Parral is Minas Nuevas. There are ore-crushing machines in the city. Parral is also famous for its aguardiente and other vinous products. Pop. about 15,000.

PARRAMATTA, pǎr-ā-māt'a, or **PARAMATTA**, New South Wales, Australia, a city of Cumberland County, on the Parramatta River, 14 miles (by rail) northwest of Sydney. It lies west of Port Jackson; has broad streets, detached houses, street railways, a beautiful park and a large orphan asylum. It is the site of Sydney reservoir; is itself a railroad centre; and is connected with Sydney by rail and by steamer. Only the Sydney settlement is older than that at Rosehill, as Parramatta was first called. It was the first shipping port for Australian grain, and the surrounding country is now full of orange groves and orchards. There are woollen manufactures, salt works and copper-smelting furnaces near the city. Pop. about 15,000.

PARRAS DE LA FUENTE, pǎr'rās dā lā fwān'tā, Mexico, city of the state of Coahuila, 83 miles west of Saltillo and 34 miles east of the salt lagoon of Parras. It is about 1,800 feet above sea-level in a fertile district growing orchard fruits, grapes and cotton, and with silver mines near. The principal industries are the manufacture of wines and brandies, some cotton-spinning and silver refining. Pop. about 25,000.

PARRHASIUS, pǎ-rā'shī-ūs, Greek painter: b. Ephesus, 4th century B.C.; d. about 388. According to the account of Seneca he purchased an old man as a slave and employed him as a model for his Prometheus, torturing him in such a way as to obtain a vivid representation of the bound and agonizing Titan. With Zeuxis he was one of the leaders of the Ionian school of painting. He painted 'Ajax Wrestling With Ulysses for the Arms of Achilles.' His artistic contest with Zeuxis is famous. The picture of the latter, it was said, attracted the birds to peck at the painted fruit, while Zeuxis himself was deceived by the representation of a curtain which Parrhasius depicted upon the wall with such exact truthfulness as to give the impression that it concealed a picture. He was credited with having been the first great master of correct drawing and the management of light and shade to convey rotundity. He dealt chiefly with mythological subjects. He was remarkable for purity of tone in painting and exquisite modeling of forms. None of his work survives; and it is known only through the descriptions and criticisms of it given in classical writers. Yet it long survived as models and a source of inspiration for Greek artists. Consult Xenophon, 'Memorabilia' III, 10.

PARRICIDE, (1) the murder of either parent. (2) The murder of any ascendant or person entitled to reverence. By Roman law the term included the murder of either parent, a brother or sister or any child. By Scots law it includes only parents or grandparents. By French law it includes any legitimate ancestor, and is treated with great severity, as it is by the

laws of many other European countries. In the United States and England the punishment is the same as for an ordinary murder. (3) The person who commits such a crime.

PARRIS, pǎr'is, **Samuel**, American clergyman: b. London, England, 1653; d. Sudbury, Mass., 27 Feb. 1720. He studied at Harvard, was in commerce at Boston, but subsequently was ordained, and in 1689-96 was first minister of Danvers, then part of Salem. He started the Salem witchcraft delusion in 1692 by beating Tituba, a South American slave of his, until she confessed herself a witch. The notion spread, and during the 16 months of its prevalence, 17 persons were put to death. In these cases Parris was active for the prosecution. Charges were brought against him by his parish in 1693, and though he admitted his error, he was dismissed in 1696. He afterward preached in Stow and Concord, and for six months in 1711 at Dunstable. Consult Fowler, 'Life and Character of Rev. Samuel Parris' (1857).

PARRISH, pǎr'ish, **Edward**, American pharmacist: b. Philadelphia, 31 May 1822; d. Fort Sill, Indian Territory, 9 Sept. 1872. He was graduated at the Philadelphia College of Pharmacy in 1842 and engaged in practice in Philadelphia. In 1864 he became professor of materia medica at the College of Pharmacy, and from 1867 until his death he occupied the chair of practical pharmacy. He was actively associated with the founding of Swarthmore College and was its first president, in 1868-70. He was a member of the committee of revision of the United States Pharmacopœia in 1850 and in 1860; was one of the original members of the American Pharmaceutical Association, serving as its president in 1868. He died of fever while acting as United States peace commissioner to the Indians. He wrote 'An Introduction to Practical Pharmacy' (1856); 'The Phantom Bouquet' (1863); 'An Essay on Education' (1866).

PARRISH, Maxfield, American artist and mural decorator: b. Philadelphia, 25 July 1870. He studied at the Pennsylvania Academy of Fine Arts and was later a pupil of Howard Pyle. Haverford College gave him the LL.D. degree. As an illustrator, he is well known for his posters and magazine covers. He designs in flat tints, strong and delicate outline, and elaborately detailed ground, or background. He has illustrated 'Mother Goose in Prose'; Washington Irving's 'Knickerbocker's History of New York'; Kenneth Grahame's 'Dream Days' and 'Golden Age'; 'The Arabian Nights'; 'Eugene Field's 'Poems of Childhood'; and other humorous works with signal success. The 'Bulletin Board' is among the best known of his paintings, and his principal mural decorations are in the possession of James J. Storrow, Boston; Mrs. Harry Payne Whitney, Westbury, L. I., and Hotel Knickerbocker, New York; Hotel Sherman, Chicago; Palace Hotel, San Francisco. Curtis Publishing Company of Philadelphia have 16 of his panels. He is a member of the Society of American Artists, National Academy of Design, honorary member of Philadelphia Water Color Club.

PARRISH, Stephen, landscape painter and etcher: b. Philadelphia, 9 July 1846. He first exhibited in the Pennsylvania Academy (1878)

and 1879 in the New York National Academy. Since then he has produced a series of landscapes, usually large canvases, showing much power of expression and poetic feeling. Among these may be mentioned 'The Road to Perry's Peak,' 'Low Tide,' 'Evening' and others, exhibited in New York, Boston and other American cities, London, Liverpool, Munich, Paris, Vienna and Dresden. One of the foremost American etchers, especially notable is his treatment of American coast scenery, as in the series 'Cape Ann to Marble Head.' The subjects of his earlier work were mostly taken from the New England coast and harbors, and in later years from the Connecticut Valley.

PARROT, the name applied generally to birds of the very strongly marked order *Psittaci*, the members of which are distinguished by the large size and arched form of the upper mandible, which terminates in an acute point overhanging the shorter lower mandible. The upper mandible is freely hinged to the skull and its sides are frequently serrated or cut into tooth-like processes. The nostrils are situated in the *cere*, at the base of the mandible. By the reversion of the fourth or outer one the toes are paired,—a disposition fitting the feet admirably for climbing. The two front toes are united at their bases by membrane, the hinder toes being free; and the adaptation of the feet is completed by the short stout tarsi, covered with rough granulated scales. The bill also aids these birds greatly in their peculiar mode of locomotion among the tree tops. The wings are of moderate size; but the tail may be short or elongated, and in some instances assists in climbing. Unlike that of most other birds the tongue is soft and fleshy throughout and serves with the upper mandible as a prehensile organ. In some species it is bushy or fringed. Parrots abound in the warm and tropical regions of the world, but rarely extend into the Temperate zone except in the Australian region. Their distribution presents many remarkable features: thus, while none occur in the Philippine Islands, species are extremely numerous in the Celebes, Solomons and intervening groups. They are particularly abundant in Central and South America and their fossil remains are found within the Arctic circle. The food ordinarily consists of seeds, fruits, buds and flowers, but rarely of tubers or even insects. These birds break open the hard husks of nuts, etc., by aid of their beaks, with great ease and dexterity. They are slow and clumsy walkers, but good climbers and strong fliers. Parrots are monogamous in habits and are said to mate for life. Their nests are generally constructed in the holes of trees, occasionally in earth banks. At other than the breeding season they are gregarious and, with rare exceptions, arboreal. The classification of the parrots is by no means settled; but most recent schemes do not depart widely from that proposed by Count Salvadori, who divides them into six families, of which the *Psittacidae* or true parrots is subdivided into six subfamilies and comprises, in its 56 genera and about 400 species, the bulk of the order, among them the macaws (q.v.) and parakeets. The other families are the *Cacatuidae* or cockatoos (q.v.), with 6 genera and 30 species; the *Loriidae* or lories, with 14 genera and 85 species, found

chiefly in Australian regions and the Moluccan groups, the *Cyclopsittacidae*, with 2 genera and 18 species, of the same region, the *Stringopidae*, containing only the remarkable nocturnal and terrestrial owl-parrot or kakapos of New Zealand, and the *Nestoridae*, formerly of six species, but three are now extinct, another equally remarkable New Zealand parrot, one variety (*N. Kea*) of which has acquired the unique habit of killing sheep for the purpose of feeding upon their kidney fat.

Of all this great assemblage of about 560 species of parrots the vast majority inhabit the Australian and Malayan region and South America; Europe has none and the United States only two, both probably doomed to early extinction. The Carolina parakeet or parakeet (*Conurus carolinensis*) formerly ranged throughout the coastal plain from Virginia to Florida. A few colonies remain in the neighborhood of Lake Ocheechee in the latter State. The other variety known as the Louisiana parakeet (*C. C. Ludovicianus*) formerly ranged the Mississippi Valley to the southern shores of Lake Erie, and west to Oklahoma. It is now found only in southwestern Arkansas and northwestern Louisiana. The Carolina parakeet has its head and neck yellow, with orange shadings, the shoulders and thighs orange and the rest of the plumage dazzling green. The Louisiana variety is bluish or peacock green and is somewhat larger in size. These birds were formerly gregarious and roamed irregularly in large flocks which subsisted on fruits, nuts and grains. During the breeding season it was likewise colonial and laid its roughish, white elliptical eggs in hollow trees. These species are not true parakeets, but stand between the macaws and true parrots. Another species found in the United States along the Mexican border is the Thick-billed parrot (*Rhynchopsitta pachyrhyncha*), a Mexican species, occurring in considerable numbers sometimes in Arizona.

Many exotic species of parrots are exhibited in zoological gardens or by bird fanciers, some of the best known of which may be mentioned. The gray parrot (*Psittacus erythacus*) of western Africa is the form which acquires the power of talking in greatest degree. The extent to which these birds can imitate the various tones of the human voice is astonishing and is one of the most remarkable instances of readiness to acquire an accomplishment of no utility to themselves known among the lower animals. These parrots grow exceedingly docile, and may live to a great age, instances being on record of birds attaining an age of 70 or more years. Of almost equal repute as a "talker" is the Mexican double yellow-head (*Amazilia oratrix*).

American species of parrots number 190. Of them all the macaws (*Anodorhynchus*) are the largest. The great Blue macaw is three feet in length and is found most abundantly in Paraguay and Brazil. The Blue-and-Yellow macaw is 30 inches in length, and is adorned also with hues of orange and olive-green. The Red-and-Blue macaw is the most brilliant of all, scarlet red above and underneath, with a blue-black and bright yellow shoulders. It has a wide range from Mexico to the valley of the Amazon. The Green parakeet of Argentina

PARROTS, PARRAKEETS AND MACAWS

1. Purple Capped Lory. 2. Leadbetter's Cockatoo. 3. Red and Blue Macaw. 4. Ring Necked Parrakeet. 5. Kakapo. 6. Blue-Crowned Hanging Parrot. 7. Rosy-Faced Love-bird.
8. Common Gray Talking Parrot. 9. Rosella Parrakeet. 10. Grass Parrakeet, or Budgerigar.

(*Myopsitta monachus*) is abundant, ranging southward to Patagonia. Of the parrotlets, or so-called "Love-Birds," there are 14 American species in the territory from Mexico to Brazil. The green parrots are American in their distribution, a familiar form being the Amazonian Blunt-tailed parrot (*Chrysotis amazonicus*). This bird is colored a bright green, and possesses a blue strip across the forehead; while the cheeks, tips of the wings and throat may be colored red or yellow. It chiefly inhabits the Orinoco territory, but extends southward on the continent. Some 45 species of this parrot are found throughout tropical America. The lories (*Loriidæ*) possess a bill of more slender form than the preceding species, with a wavy or sinuous margin. The plumage is brilliantly colored, mostly crimson and green; and in some cases it has been proved that the females are red and the males of the same species green, although the red and green lories were formerly considered to be generically distinct. Some of the species are remarkable among parrots because of the elongation of the papillæ of the tongue into brushes of filaments, on which account they are styled brush-tongued parrots. They feed largely on the nectar of flowers. The lories are particularly characteristic of the Moluccas and New Guinea, where many of them are the most richly colored of all birds.

The parakeets constitute the largest sub-family (*Palæornithinæ*) of the *Psittacidae*; and are characterized by the generally small size of the body and of the beak, the upper mandible being also less convex or arched than in the true parrots. The tail-feathers are very long and form graceful and trim. The islands of the Eastern Archipelago form the chief habitat of these birds, but species also occur in India, Cochin China, Ceylon and Australia. Among the most familiar forms included in this sub-family are the Rose-ringed and Alexandrine parakeets. The former (*Palæornis torquata*) is found in India and also on the eastern coasts of Africa. It averages 15 inches in length, the tail making up nearly two-thirds of this. The body-color is a bright green, the specific name being derived from the presence of a pink circle around the neck. The Alexandrine parakeet (*P. alexandri*) of India is a nearly-allied species. These birds may be taught to speak with distinctness. From three to four eggs are produced, the nest being situated in holes of trees and similar places.

The ground parakeets of Australia are so named from their terrestrial habits, these forms never perching on trees, but inhabiting flat grounds, and living in plains or among the reeds and grass swamps. They generally live in solitary pairs. The nest is of simple construction and situated on the ground. The common ground parakeet of Australia (*Pezoporus terrestris*) possesses a green and black plumage, the tail being similarly colored, and the body-feathers having each a band of dark-brown hue. It measures about 12 inches in length, inclusive of the tail. The grass parakeets of Australia, of which the common cage-bird, the small warbling parakeet (*Melopsittacus undulatus*) is a good example, are also to a great extent terrestrial in habits. They inhabit the central flat lands of Australia and feed on the seeds of the grasses covering the

plains. They perch on the eucalypti or other trees during the day, and the eggs are deposited in the hollows of the trees. The English name of the species above mentioned is derived from the warbling notes they emit—a sort of song differing widely from the general coarse screech of the parrot tribe. The genus *Neophema* also includes several representative forms of Australian grass parakeets. Among other interesting forms of these peculiar birds are the Pygmy parrots, tiny forms scarcely three inches in length, inhabiting the Papuan Islands, and the Bat parrots (*Loriculus*) of Australia, so-called because of their bat-like habit of hanging head downward. They not only sleep in this position, but often hang thus in groups, caressing and feeding one another. Of the true "Love-birds" (*Agapornis*) there are nine species, the best known being the Rosy-faced species.

Parrots take very naturally to domestication, and in their native countries many species frequent human habitations or have even become more or less completely domesticated. During the luxury-loving period of the Roman Empire the African species were first brought to Europe as pets or food, and since then fully three-fourths of the known species have been exhibited in Europe and America. The favorite cage birds are the talking gray and green parrots of Africa and South America, respectively. They are readily taken by means of snares or bird lime and decoys, or the young are taken from the nest and raised by hand. Some of the smaller species breed readily in confinement. The chief requisites to success in keeping them are plenty of good fresh food, both dry and succulent, cleanliness and opportunity for exercise.

Consult Greene, W. T., 'Parrots in Captivity' (3 vols., London 1884-87), and 'Parakeets: their Breeding and Management' (London 1898); Knowlton, F. H., 'Birds of the World' (New York 1909); Page, C. N., 'Parrots and Other Talking Birds' (Des Moines 1906); Ridgway, R., 'The Birds of North and Middle America' (Bulletin No. 50, United States National Museum, Washington 1916).

PARROT-FISHES, fishes of the large marine family *Scaridæ*, allied to the wrasses. The body in this family is oblong, with the back arched, dorsal fin long and low, tail short, square and powerful, scales large and round and head terminating in a parrot-like beak, containing numerous small teeth fused into a single mass. These fishes are mainly tropical, herbivorous, usually of brilliant coloration and of little value, in the estimation of North Americans, for either food or game. The smaller ones usually lurk about weedy shores, hiding and feeding among the algæ; larger species are to be found about coral reefs. In Hawaii several species are regarded as excellent to be eaten raw, and are caught regularly by native fishermen; and others are daily trapped and brought to market in the West Indies, especially about Porto Rico, where they go under the general name of oros. The best known, probably, is the turquoise blue parrot-fish or "tumble rose" (*Scarus cæruleus*), which sometimes weighs 15 or 20 pounds, and is caught from Virginia to Brazil. Another common and important one on the Florida coast and throughout the West In-

dies is the guacamaia (*Pseudo-scarus guacamaia*), which is usually about two feet in length. Consult Jordan, J. D., 'A Guide to the Study of Fishes' (New York 1905).

PARROTT, pār'ôt, Robert Parker, American inventor and ordnance expert: b. Lee, N. H., 5 Oct. 1804; d. Cold Spring, N. Y., 24 Dec. 1877. He was graduated at the United States Military Academy in 1824, for the next five years taught natural and experimental science there, saw active service against the Creeks in 1836 and in the same year became captain of ordnance and a member of the Ordnance Bureau in Washington. He resigned his commission immediately after to become superintendent of the West Point Iron and Cannon Foundry at Cold Springs, N. Y. Utilizing the process of hollow casting and cooling patented by General Rodman and using shrunk hoops of wrought iron he perfected the cannon called by his name which showed such wonderful durability in the Civil War, during which his dealings with the Federal government were marked by rare lack of greed and an evident unwillingness to take personal advantage of the needs of the army. He severed his connection with the Cold Spring Foundry in 1867.

PARROTT RIFLE. See **ORDNANCE**.

PARRSBORO, pärz'bür-ō, Nova Scotia, seaport town, port entry and county-seat of Cumberland County, situated on a strait connecting Minas Basin with the Bay of Fundy, 23 miles southwest of Athol, on the Cumberland Railway and the Coal Company Railway. There is a considerable trade in coal and lumber and there are saw, grist mills and a shipbuilding yard. The town has modern waterworks and an electric-lighting plant. Pop. 2,856.

PARRY, pär'i, Charles Christopher, American botanist: b. Admington, Gloucestershire, England, 25 Aug. 1823; d. Davenport, Iowa, 20 Feb. 1890. He came to the United States with his parents in 1832 and was educated at Union College and at Columbia University, taking his degree in medicine. He engaged in practice at Davenport, Iowa, in 1846, but in 1849 became assistant surgeon to the Mexican Boundary Survey and afterward devoted himself to scientific researches. He traveled extensively through the southwestern and western portions of the United States studying the flora of the country and in 1867 he became botanist for the Pacific Railroad survey. He was botanist of the United States Department of Agriculture in 1869-71, and arranged the botanical collections of the Smithsonian Institution. He was afterward botanist to commissions of inquiry in San Domingo and remote regions of Mexico. He gathered a collection of more than 18,000 botanical specimens; discovered hundreds of species, of which more than 50 bear his name; and acquired an international reputation. Author of 'Botanical Observations in Western Wyoming' (1874); 'Revision of the United States Pacific Coast Species of *Arctostaphylos*' (1883); 'The North American Genus *Ceanothus*' (1888), etc.

PARRY, SIR Charles Hubert Hastings, English composer: b. Bournemouth 27 Feb. 1848; d. near Worthing, 7 Oct. 1918. Educated at Eton, Oxford and Stuttgart, he became an underwriter at Lloyd's in 1871, where he suffered serious financial losses that ended his busi-

ness career in three years. He then devoted himself to composition and gradually worked his way to the front rank of English masters. His 'Scenes from Prometheus Unbound' was performed in 1880 and the 'First Symphony' in 1882. A more ambitious work, the oratorio 'Judith,' was produced in Birmingham in 1888, the first example of a type peculiarly his own. A remarkable series of sacred and secular cantatas followed, but his purely orchestral works, excepting the 'Symphonic Variations' (1897), were less successful than his works for chorus and orchestra. Among his distinctive choral compositions are Milton's 'L' Allegro ed il Penseroso,' the song from Tennyson's 'Lotos Eaters' and the psalm 'De Profundis.' A series of short cantatas issued from 1903, including 'Voces Clamantium,' 'The Soul's Ransom' and 'Beyond these Voices,' based on Biblical episodes. He wrote 'The Evolution of the Art of Music' and 'The 17th Century' for 'The Oxford History of Music' and various lectures delivered as professor of music at Oxford.

PARRY, SIR William Edward, English navigator: b. Bath, England, 19 Dec. 1790; d. Ems, Germany, 8 July 1855. He entered the navy in 1803 and was lieutenant on the *Alexandria*, a frigate employed in protecting the whalers of Spitzbergen (1811-13). In 1818 he joined the Arctic expedition of Sir John Ross, as second in command. The venture proving unsuccessful, Parry was given command of an expedition in 1819, and with the *Hecla* and *Griper* succeeded in reaching long. 114° W., earning thereby the £5,000 reward offered by Parliament to the ship which should first reach that point. On this expedition he entered Baffin Bay and discovered Barrow Strait, Prince Regent Inlet, Melville Sound, Banks Strait and Wellington Channel. He wintered at Melville Island and returned to England the following year. In a second expedition to the Arctic regions (1821-23) he spent two winters on the east coast of Melville Peninsula waiting for the breaking up of the ice, which did not take place, and in studying the Eskimos and collecting scientific data. A third Arctic expedition resulted in the wrecking of the *Fury* at Prince Regent Inlet. In 1827, with the consent to the Admiralty, Parry attempted to reach the North Pole by Spitzbergen. Leaving the *Hecla* at Turenberg Bay, he started for the pole in two steel boats fitted with steel runners, to be used as sleighs on the ice. The party, which consisted of 28 men, had provisions for 70 days. It gained a point farther north than any then reached (82° 45'), the farthest north reached for 48 years. Parry was knighted in 1829, made admiral in 1852 and in 1853 was appointed lieutenant and deputy governor at the Greenwich Hospital. He wrote 'Voyages for the Northwest Passage' (1821); 'Narrative of an Attempt to Reach the North Pole in Boats' (1827). Consult Parry, Edward, 'Memoirs of Admiral Sir W. E. Parry' (London 1857).

PARRY ISLANDS, Canada, an Arctic archipelago of Franklin territory, north of Melville Sound, Barrow Strait and Lancaster Sound. The principal islands are Bathurst, Cornwallis, North Devon, Melville and Prince Patrick, all of which have no permanent settlements. Parry (q.v.) in 1819 wintered on Melville Island and the islands and sur-

rounding region were thoroughly explored during the Franklin Research expeditions. They are bleak and inhospitable; the coasts precipitous and rocky, and glaciers cover the interior.

PARSEES, pār'sēz ("Parsis," people of ancient Persia), the small remnant of the followers of the ancient Persian religion of Zoroaster (Zarathustra or Zerdusht). The relation in which Zoroaster stood to the Iranian faith has been much discussed; his existence has even been denied; and it is difficult to state clearly the original principles of the Zoroastrian faith. (See ZOROASTER; AVESTA; ZEND). At first the doctrine was monotheism; and Zoroaster taught the existence of but one deity; the Ahura-Mazdão (Ormuzd), the creator to whom all good things, spiritual and material, belong. But his speculative philosophy was a dualism. The two sides of Ahura-Mazdão and Angrō-Mainyush (Ahriman), who represented Good and Evil, God and the Devil, and Parseeism became a characteristic dualism.

The Zoroastrian creed flourished up to the time of Alexander the Great, but rapidly declined under his successors. Ardashir (Artaxerxes) (212 A.D.), a native Persian, attempted the restoration of the partly lost, partly forgotten books of Zoroaster, which he effected through the inspiration of a Magian sage, chosen out of 40,000 Magi. The sacred volumes were translated into the vernacular and distributed, and fire-temples were built throughout the length and breadth of the land. The Magi or priests were all-powerful and hated Greek civilization. "Far too long," wrote the king, "for more than 500 years, has the poison of Aristotle spread." The Jews have left us some account of the oppression to which they as unbelievers were exposed in Persia. In return the Magi were hated by the Jews. From the period of its re-establishment the Zoroastrian religion flourished till, in 651 A.D., the Persian army under Yezdegird was routed by the caliph Omar. The Zoroastrian population was converted to the Mohammedan faith; the remnant that would not apostatize were subjected to severe oppression and persecution. Several thousand "Guebres" are still found in Persia, mainly in Yezd, Kerman and at Teheran. Others found a home on the west coast of India, chiefly at Bombay, Surai, Ahmedabad, where they now live under English rule and form one of the most respectable and thriving sections of the community, to the number of over 100,000. Parsee traders have also settled at Calcutta, Madras, Aden, Zanzibar, in Burma and in China, where they bear equally with their poorer brethren in Persia the highest character. Their general appearance is prepossessing, and many of their women are beautiful. They conform to the laws of the country they inhabit; and its language is also theirs, except in the ritual of their religion, when Zend is used by the priests as laity. They value highly an English education, and not a few have studied law in England. Conspicuous among Parsee merchant-princes was Sir Jamsetjee Jejeebhoy. In 1891 there were 89,994 Parsees in India, 60 per cent of them in Bombay.

Parsees eat nothing cooked by a person of another religion; and touch neither beef nor pork. Marriages can only be contracted with persons of their own caste and creed. Polygamy, except after divorce, is forbidden. Per-

sons convicted of unchastity are put to death. Their dead are not buried, but exposed on an iron grating in the Dakhma, or Tower of Silence.

Ahura-Mazdão being the origin of light, his symbol is the sun, the moon, the planets and fire. Temples and altars must be fed with the holy fire, brought down from heaven and the contamination of whose flame is punishable with death. The priests themselves approach it only with veiled face, and only touch it with sacred instruments. Parsees never consider fire and light as anything but emblems of divinity. Their ethical code may be summed up in the three words—purity of thought, of word and of deed.

Consult Bharucha, 'Zoroastrian Religion and Customs' (1893); Haug, 'Essays on the Sacred Language, Writings and Religion of the Parsees' (2d ed., by West, 1878); 'Dosabhai Framji Karaka, C. S. I., 'History of the Parsis' (2 vols., 1884); Hovelacque, 'L'Avesta, Zoroastre, et el Mazdeisme' (1880); Jackson, A. V. W., 'Persia Past and Present' (New York 1906); Menant, Delphine, 'Les Parsis' (Paris 1898); Modi, J. J., 'The Religious System of the Parsis' (Chicago 1893); 'Early History of the Parsis' (Bombay 1905).

PARSIFAL, pār'sē-fäl, name of an opera by Richard Wagner. The fable of the drama is founded on an episode in the Arthurian cycle, which Wolfram von Eschenbach put into metrical form in his *Perceval*, and the pursuit of the Holy Grail, and this appears to have been the source of Wagner's inspiration. The composer took three years to complete his work, finishing the outline of his music scheme in 1879 and the orchestration in 1882, the year in which the opera was first performed at Bayreuth. He places the scene at Monsalvat, Spain, in the Castle of the Holy Grail. Klingsor, the malignant magician, has thrown his spell over Amfortas, formerly a Knight of the Holy Grail, who has been wounded by the Holy Spear, which he has been dispossessed of by the sorcerer. Klingsor hopes to gain control of the knights through the lovely Kundry, who will seduce them to break their vow of chastity. Parsifal is cast out from the castle by the knights because of his indifference to the Holy Grail, which they adore. But he is impenetrable to the spells of Klingsor and the charms of Kundry, and finally recovers the Holy Spear from the magician. He has been brought to a sense of the Holy Grail's significance and importance and starts out in search of it. He is eventually crowned king by the Knights of the Holy Grail. Kundry repents and dies after baptism in hope and peace; while the wound of Amfortas, which no salve has been able to close, is healed by contact with the Holy Spear. 'Parsifal' was first produced in the United States in December 1903, in New York City. See WAGNER, RICHARD.

PARSIS. See PARSEES.

PARSLEY, a biennial herb (*Carum petroselinum*) of the order *Umbelliferae*. During its early stages the leaves are arranged in a rosette and rarely rise more than six inches above the ground, but when in flower the plant may be three feet tall. It bears pinnate leaves divided and subdivided in threes, and in cultivated varieties greatly divided. It is a native of southern

Europe, where it has been cultivated for centuries as a "sweet herb" and whence it has been carried to civilized countries throughout the world. In some regions it has become naturalized. Formerly it was employed in medicine, but now is used principally as a garnish or as a flavoring ingredient in soups, stews, dressings, etc., for which purpose the "moss-curled" varieties are most popular. The "fern-leaved" sorts are more dainty, and the "plain" rather coarse. Hamburg parsley is a variety with large carrot-like roots, which are boiled and served like other roots or used for flavoring soups, stews, etc. The plant succeeds best in rich, light loam well supplied with nitrogenous plant-food. Since the seed is very slow to germinate, it should be soaked before planting and some radish seed planted with it to mark its position and thus permit of early cultivation. The plants are thinned to stand about six inches asunder in rows 18 inches apart and given clean cultivation throughout the season. In the autumn the roots may be transplanted to the greenhouse or a window-box for a winter supply of leaves, or they may be left in the ground until spring, when they will furnish a supply. The frequent removal of the leaves and the cutting out of the flower-stalk when it first appears will extend the season of production until new plants are in bearing.

PARSLEY, Giant. See COW-PARSNIP.

PARSNIP, a biennial herb (*Pastinaca sativa*) of the family *Apiaceæ*. Its stout, grooved, hollow stem which rises from a rosette of radical odd-pinnate leaves, often grows more than four feet tall. The small yellow flowers are followed by disc-shaped fruits ("seeds"), which retain their vitality only one year. The plant is a native of western Asia and adjacent Europe, where it was cultivated before the Christian era, and whence it has been taken by man to all civilized countries in temperate climates. In many places it has become a troublesome weed in neglected fields, and as such it loses its thick root and may even become an annual. Its roots, which often attain a length of 18 inches and a diameter of three or four inches at the crown, are used as a vegetable and as food for livestock. The plants succeed best in deep, fairly rich, well-drained but moist loam, free from stones and other obstructions. The seed, being slow to germinate, should be sown very early in the spring and some radish seeds sown with it. The radish plants which appear quickly will show the positions of the rows and thus permit early cultivation. They must be removed promptly when the parsnip plants appear. The rows should be about 18 inches apart and the plants six inches asunder in the rows. Clean cultivation must be given until the plants shade the ground. Since the roots are improved by frost if left in the ground they need not be stored; but if stored they must be kept moist to prevent their shriveling and thus becoming tough. In the spring the roots should be used before growth starts, because they quickly become acrid. There are a few short-rooted varieties which are adapted to shallow and stony soils.

PARSON, in English law, the rector of a parish; also, in a general sense, one that has a cure of souls, a clergyman, or minister of the gospel. He is called parson (Latin *persona*),

because the Church is represented in his person. A parson in England has for life the freehold of the parsonage house, glebe, tithes and other ecclesiastical dues. The modes of becoming parson involve four requisites, namely, the taking of holy orders, presentation, institution and induction. The duties of a parson are principally ecclesiastical, such as carrying on divine service in the parish church, administering the sacraments, preaching, etc. A parson during his lifetime may lose his parochial preferment either by cession, in taking another living, by consecration; on promotion to a bishopric, when all other preferments become void; by resignation, but only when accepted by the bishop; and lastly by legal deprivation, for heresy, infidelity, gross immorality or other causes.

PARSON-BIRD, or **POÉ-BIRD**, a small bird (*Prosthemadera nova-zealandiae*), one of the honey-eaters, a native of New Zealand and the islands of Australia. Its plumage is jet-black, with metallic iridescence, except two prominent globular lappets of white feathers on each side of the throat, which look like the white lawn "bands" of a Church of England clergyman. It has a fine song, great powers of mimicry for which it is popular as a cage bird. Its flight is embellished with somersaults and other remarkable antics.

PARSONS, *pär'sônz*, **Albert Ross**, American musician and archæologist: b. Sandusky, Ohio, 16 Sept. 1847. He was educated in Buffalo, N. Y., and Germany, 1867-72, and became prominent as a specialist in musical pedagogy and technics, and he has also devoted much study to archæology. As a pianist and a composer of pianoforte music he gained considerable attention and he has acted as a critic of music. He has lectured on Dante and other literary subjects, designed the symbolic pyramid mausoleum at Greenwood cemetery, and has written 'Wagner's Beethoven' (1870); 'Parsifal, or the Finding of Christ through Art'; 'Science of Pianoforte Practice'; 'The Secret of Wagner's Genius'; 'New Light from the Great Pyramid' (1893); 'Cornet Joseph Parsons' (1897); 'The Road Map of the Stars' (1911); 'Surf Lines' (1913); 'Religion and Philosophy'; 'The Virtuoso Handling of the Piano, Advanced Exercises' (1917); 'An Evening Prayer' (poem, 1917).

PARSONS, **Alfred William**, English painter: b. Beckington, Somersetshire, 2 Dec. 1847. He has made his specialty water-color landscapes of English scenery, executed with great dash yet lightness of touch, accuracy of drawing and dazzling color. His pictures have been awarded medals at Paris (1889); Chicago (1893) and Munich (1893). He also designs in black and white, and in collaboration with E. A. Abbey (q.v.), has furnished illustrations for 'Old Songs'; 'A Quiet Life'; Herrick's poems, 'She Stoops to Conquer'; 'Alone' (from Wordsworth's Sonnets); the 'Warwickshire Avon' and 'Notes on Japan' (text also by Parsons); 'The Danube from the Black Sea to the Black Forest,' and for *Harper's Magazine* and other publications. Among the most characteristic of his paintings are 'When Nature Painted All Things Gay' (1887), brought by the Chantrey bequest; and 'A Mid-May Morning.'

PARSONS, Charles, American artist: b. Manchester, England, 8 May 1821; d. 1910. He was educated in New York; studied art at the National Academy; was elected an A. N. A. in 1860; worked as a lithographer 1838-61; and became director of the art department of Harper and Bros., for whose publications he furnished many illustrations, and from whose employ he retired in 1889. He won some repute as a landscape painter and exhibited at the National Academy and the exhibitions of the Water Color Society. His best known paintings are 'Salem' (1876); 'November' (1877); 'Gravesend Bay' (1878) and 'Old Orchard' (1884).

PARSONS, Sir Charles Algernon, English inventor and shipbuilder: b. 13 June 1854. He was the fourth son of the Earl of Rosse and was educated at Saint John's College, Cambridge. He established the electrical and engineering works of C. A. Parsons and Company at Heaton, Newcastle-on-Tyne and the Parsons Marine Steam Turbine Company as well as electrical supply companies at Cambridge and Scarborough. He invented the Parsons Compound steam turbine, introduced in 1884 and later improved; non-skid chains for automobiles; the auxetogramophone and a geared turbine. He was elected to the Royal Society in 1898; was justice of the peace in Northumberland and was knighted in 1911. He delivered the Rede Lecture for 1911, which he later published, 'The Steam Turbine' (1912).

PARSONS, Charles Lathrop, American chemist: b. New Marlboro, Mass., 23 March 1867. He was graduated at Cornell University in 1888 and in 1890-1911 he was professor of chemistry at New Hampshire College. In 1911 he was appointed chief mineral chemist at the Bureau of Mines, Washington, D. C. His researches on the atomic weight of beryllium won for him the Nichols medal in 1904. He has contributed many scientific papers to chemical journals and government bulletins, and with Prof. A. J. Moses is author of 'Mineralogy, Crystallography and Blowpipe Analysis' (1895-1911); 'Beryllium, Its Chemistry and Literature' (1908).

PARSONS, Frank, American lawyer and political economist: b. Mount Holly, N. J., 14 Nov. 1854; d. Boston, Mass., 26 Sept. 1908. He was graduated from Cornell in 1873; studied law and was admitted to the bar in Boston. He rewrote several law treatises, including Morse 'On Banks and Banking,' Perry 'On Trusts,' and May 'On Insurance,' and in 1892 was appointed lecturer on law at Boston University. He became known through his books and lectures as a student of political economy. From 1897 to 1900 he was professor of history and political science at Kansas Agricultural College, and in 1900 became professor of political science at Ruskin College, Trenton, Mo. He was dean of the university extension department there, and lectured for the University Extension Association of Chicago. In 1901-02 he was an expert witness before the United States Industrial Commission on the public ownership of railroads, telephones and telegraphs. His publications include 'The World's Best Books' (1892); 'Our Country's Need' (1894); 'The Drift of Our Time' (1898); 'Rational Money' (1899); 'The New Political Economy' (1899);

'The Power of the Ideal' (1899); 'The Bondage of Cities'; 'The City for the People' (1900); 'Direct Legislation' (1900); 'The Story of New Zealand'; 'The Heart of the Railway Problem' (1906); 'The Railways, the Trusts and the People.' He was among the leaders of the progressive economists and an earnest advocate of the public ownership of monopolies.

PARSONS, Herbert, American politician: b. New York, 28 Oct. 1869, son of John Edward Parsons (q.v.). He was educated at Yale, the University of Berlin, Harvard Law School and the Metropolis Law School, and was admitted to the bar in 1895. He was alderman in New York in 1900-03, and served in Congress in 1905-11. He was president of the Republican county committee in 1905-10 and was an effective worker for the nomination and election of Charles E. Hughes for governor. He is senior member of the law firm of Parsons, Closson and McIlvaine. In 1915 he was delegate-at-large at the New York State Constitutional Convention; was appointed a member of the Republican National Committee for 1916-20; and in 1917 was commissioned major in the Aviation Reserve Corps.

PARSONS, John Edward, American lawyer: b. New York, 24 Oct. 1829; d. 16 Jan. 1915. He was graduated at the University of New York in 1848 and was admitted to the bar in 1852. He engaged in practice in New York and gained a high reputation. In 1891-1910 he was counsel for the American Sugar Refining Company, successfully defending the company's interests in its trial under the Sherman Act in the Supreme Court, and winning a favorable decision in January 1895. In the course of an investigation of alleged weight frauds in 1909 he, together with other officials of the company, was indicted. The trial resulted in a disagreement and was not retried. He was a director of the Metropolitan Trust Company, was actively interested in the welfare of several hospitals and in the work of Cooper Union.

PARSONS, Lewis Baldwin, American soldier and lawyer: b. Genesee County, N. Y., 5 April 1818; d. Flora, Ill., 16 March 1907. He was graduated from Yale in 1840, from the Harvard Law School in 1844, and established a law practice in Alton, Ill., where he was city attorney in 1846-49. At the outbreak of the Civil War he entered the Union army as captain of volunteers, served through the war, with promotion, was chief of river and railroad transportation of the national armies and was retired in 1866 with the rank of brevet brigadier-general of volunteers. He afterward devoted himself to law practice, and in 1895-98 was president of the Illinois Soldiers' and Sailors' Home.

PARSONS, or PERSONS, Robert, English Jesuit and controversialist: b. Nether Stowey, Somerset, 24 June 1546; d. Rome, 15 April 1610. He was educated at Oxford, was elected fellow of Balliol in 1568, and in 1574 became its dean. In 1574 Parsons went to the Continent, and on his way to Italy stopped at Louvain, where he was probably received into the Roman Catholic Church, and at Rome entered upon his novitiate in the Society of Jesus (1575). In 1578 he was ordained priest

and made English penitentiary at the Vatican. With Edmund Campion (q.v.) and several secular priests he arrived in England in 1573 under instructions from Aquaviva, general of the order, to aid the secular clergy and on no account to discuss political questions. At that time the Jesuits were forbidden to set foot in England on pain of death; and Parsons landed at Dover in a military disguise. He encouraged the secular priests, then closely in hiding, converted many of the nobility and set up a secret press, which was transferred from place to place at his order, and printed controversial tracts, among them Parsons' 'Brief Discourse' (1581) and Campion's well-known 'Decem Rationes' (1581). Campion was at last seized, but Parsons escaped to Normandy (1581). He continued, however, to devote his energies to the restoration of the Roman Catholic Church in England, and did everything possible to promote the attempted invasion of England in 1588 by Philip II of Spain, which ended so disastrously in the defeat of the Armada. He used his influence with the Catholic courts of Europe to save Mary Queen of Scots. For a short time in 1588 he was rector of the English College at Rome, and in 1582-92 established various schools and seminaries in France and Spain for English Catholics. From 1597 until his death he was rector of the English College and later was made prefect of the Jesuit mission. By virtue of this office, confirmed to him in 1606, he had direct control of all foreign seminaries governed by the order. He was an indefatigable worker, an unrivaled controversialist, and a writer the clearness and simplicity of whose English has been highly praised. His 'Book of Resolution, or the Christian Directory' (1582, and subsequently enlarged) was often reprinted, and Dean Stanhope prepared a Protestant edition of it (1700). Consult Foley, 'Records of the English Province of the Society of Jesus'; Gee, 'The Jesuits' Memorial' (1690); More, 'Historia Provinciæ Anglicanæ Societatis Jesu' (1660).

PARSONS, Samuel Holden, American soldier: b. Lyme, Conn., 14 May 1737; d. Big Beaver River, Ohio, 17 Nov. 1789. He was graduated from Harvard in 1756, admitted to the bar in 1759 and engaged in law practice at Lyme. For 18 years he was a member of the State assembly and is accredited with originating the idea of a general colonial congress. At the outbreak of the American Revolution he was appointed colonel and stationed in Massachusetts. He planned the capture of Ticonderoga executed by Ethan Allen, and after the evacuation of Boston by the British was transferred to New York, where he participated in the battles of Long Island, Harlem Heights and White Plains, and later served under Washington in New Jersey. He was a member of the board which tried General André, and in that year was promoted major-general and succeeded to the command of General Putnam, which he held until the close of the war. After the war he resumed his law practice, was appointed by Washington in 1789 the first judge of the Northwest Territory and took up his residence near Marietta, Ohio, where he was drowned in the Beaver River in the same year. Parsons has been accused of giving information to Sir Henry Clinton concerning the state

of the Federal armies, and letters are said to be in existence written by him to that general. A refutation of this charge was written by George B. Loring. Consult Hall, C. S., 'Life and Letters of Samuel Holden Parsons' (Binghamton 1905); Loring, G. B., 'A Vindication of General Parsons' (Salem, 1888).

PARSONS, Theophilus, American jurist: b. Byfield, Mass., 24 Feb. 1750; d. Boston, Mass., 30 Oct. 1813. He was graduated from Harvard in 1769, studied law, was admitted to the bar in 1774, and began practice in Falmouth, Me., but his prospects were interrupted by the almost total destruction of that place by the British in 1775. He then returned to Byfield, where he studied law for several years, and laid the foundation of the vast legal knowledge for which he was afterward distinguished. Settling in Newburyport he there established a large practice, and taking an active interest in politics allied himself with the conservatives, who later became the Federalist party. He was, in 1778, a member of the "Essex Junto," which opposed the adoption of the State constitution approved by the legislature. The pamphlet entitled 'The Essex Result,' undoubtedly written by him and circulated widely throughout the State, did much toward the rejection of the constitution. He was a member of the convention which, in 1779, framed the constitution ultimately adopted by Massachusetts, and he also served as a member of the convention which ratified the Federal Constitution in 1788. His attitude toward the latter was extremely favorable, and the "Proposition" presented by John Hancock and usually credited to him was written by Parsons. After the adoption of the Constitution he took no further active part in politics, but devoted himself to his profession, and under his instruction John Quincy Adams (q.v.) gained a large share of the legal skill which afterward made him a national figure. In 1800 Parsons removed to Boston, and in 1806 was appointed chief justice of the State Supreme Court, which office he occupied until his death. As a lawyer and a justice he enjoyed an enviable reputation, standing at the head of his profession in his State. His decisions upon the laws governing real property, marine insurance and pleading were regarded as of highest value and he earnestly strove to lessen the delays of the law in bringing cases to trial. A collection of his decisions was published in 1836 under the title 'Commentaries on the Laws of the United States, by Theophilus Parsons, late Chief Justice of Massachusetts.' Consult Knapp, S. L., 'Biographical Sketches of Eminent Lawyers' (Boston 1821); memoir by his son, Theophilus Parsons (1859); Stone, E. F., 'Parsons and the Constitutional Convention' (Salem 1899).

PARSONS, Theophilus, American author, son of Theophilus Parsons (q.v.): b. Newburyport, Mass., 17 May 1797; d. Cambridge, Mass., 26 Jan. 1882. He was graduated in 1815 at Harvard, where he became, in 1847, Dane professor of law. He founded the *United States Literary Gazette* and wrote much in support of Swedenborgian doctrines. He published a 'Treatise on the Law of Contracts' (1853); 'Elements of Mercantile Law' (1856); 'Memoir of Chief Justice Parsons' (1859); 'Law of Partnership' (1867); 'Deus Homo'

(1867); 'The Infinite and the Finite' (1872); and 'The Rights of a Citizen of the United States' (1875).

PARSONS, Thomas William, American poet: b. Boston, 18 Aug. 1819; d. Scituate, Mass., 3 Sept. 1892. He went to Europe at 17 and spent several years in Italy, where he devoted himself to the study of Dante; and on his return to Boston in 1843 he studied at the Harvard Medical School, practised dentistry in Boston and London and devoted the last 20 years of his life to literature. He wrote 'Ghetto di Roma' (1854); 'The Magnolia' (1867); 'The Old House at Sudbury' (1870); 'The Shadow of the Obelisk' (1872); and 'Circum Præcordia' (1892), all poems of much lyric beauty, but too elevated in tone and thought to be popular, his 'Lines on a Bust of Dante' first printed in 1841 being the exception. Parsons is better known as the "poet" of Longfellow's 'Tales of a Wayside Inn,' and best as the author of a matchless version of parts of Dante's 'Divina Commedia,' namely the 'Inferno' entire (1867), and much of the 'Purgatorio,' with scanty fragments of the 'Paradiso.' An edition of his poems appeared in 1893.

PARSONS, Usher, American surgeon: b. Alfred, Me., 8 Aug. 1788; d. Providence, R. I., 19 Dec. 1868. He studied medicine with Dr. John Warren in Boston and in 1812 entered the United States navy as surgeon's mate. At the battle of Lake Erie he was acting surgeon on the U.S.S. *Lawrence* and in recognition of his services was promoted full surgeon. He afterward served under Perry on the frigate *Java*, and in 1820 he resigned and returned to private practice at Providence. He was professor of anatomy at Dartmouth College in 1820-22; and of anatomy and surgery at Brown in 1823-28. He was president of the Rhode Island Medical Society in 1837-39 and was the first vice-president of the American Medical Association in 1853. Author of 'The Art of Making Anatomic Preparations' (1831); 'Sailors' Physician' (1851); 'The History of the Battle of Lake Erie' (1852), etc.

PARSONS, William Barclay, American civil engineer: b. New York, 13 April 1859. He was graduated from Columbia in 1879, and from the Columbia School of Mines in 1882. He at once entered the service of the Erie Railroad, resigning after a few years to take up general practice as consulting engineer. In 1894 he became chief engineer of the Rapid Transit Commission of New York, and designed and carried out the underground railway there. He has been connected professionally with railroad construction in various parts of the world, especially in China. He was a member of the Isthmian Canal Commission (1904) and of the board of consulting engineers of Panama Canal (1905); and brigadier-general, chief of engineers of the State of New York, and has been trustee of Columbia University since 1897. Besides contributing to various periodicals and to the 'Encyclopædia Americana,' has published 'Track' (1885); 'Turnouts' (1885); 'An American Engineer in China' (1900).

PARSONS, Kan., city in Labette County, on the Saint Louis and San Francisco and the Missouri, Kansas and Texas railways, about

125 miles in direct line south by east of Topeka. It was settled in the early "settlement days" of Kansas, but was laid out and incorporated in 1871, and in 1873 was made a city of the second class. It is in a productive agricultural region and the commercial centre of quite an extent of territory. The chief industrial establishments are grain elevators, creameries, flour and feed mills, foundry, agricultural implements works, and railroad car, repair and machine shops. The Missouri, Kansas and Texas Railroad has its general offices in this city. There are two parks, well-kept streets and good roads leading into Parsons. The prominent buildings are the State Hospital for the Insane, the Masonic Temple, the Y. M. C. A. building, churches, schools and the Missouri, Kansas and Texas station and office building. The educational institutions are the high school, public and parish elementary schools and a public library. Natural gas is in general use for lighting and for fuel. Pop. (1920) 16,028.

PARSONS, Pa., borough in Luzerne County, two miles northeast of Wilkesbarre, on the Delaware and Hudson and the Central of New Jersey railroads. It is situated in a coal and oil region and manufactures tinware and silks. Pop. 5,638.

PARSON'S CAUSE, a famous case in Virginian colonial history, growing out of acts passed by the house of burgesses in 1755 and 1758, whereby the salaries of the clergy, fixed at 16,000 pounds of tobacco, were made payable in currency, the price being fixed at the rate received for the tobacco in years of normal crops. The original law, fixing the amount of tobacco to be paid the clergy by the planters was enacted in 1696 and was revised and re-enacted by the king in 1748. The acts of the house of burgesses, temporarily suspending payment in tobacco, were due to shortage in crops and a consequently increased value which made the usual 16,000 pounds an exorbitant assessment. The act of 1755 passed without protest from the clergy; but in 1758 the matter was taken to the king and an order of council annulling the act of the house of burgesses was obtained. The act applied to all classes of debtors, but the case became known as the "Parson's Cause" from the fact that the clergy were the only class of creditors to protest. The case was tried in the court of Hanover County, Va., 5 Nov. 1763, Col. John Henry presiding, and Patrick Henry, his son, appearing as counsel against the clergy. Patrick Henry's speech, denouncing the action of the king in breaking his compact with the people and overriding the action of the legislature brought him into widespread public notice, marking the first of his impassioned appeals for the maintenance of the people's established rights under English law. His declaration that the king by his own conduct toward a legally enacted law from being the father of his people had degenerated into a tyrant and had forfeited all rights to his subjects' obedience to his order regarding that law was met with cries of "Treason!"; but the jury returned a verdict of one penny damages, although the court rendered a decision against the validity of the law. Consult Henry, W. H., 'Patrick Henry' (Vol. I, 1891); Tyler, M. C., 'Patrick Henry' (in the 'American Statesmen Series' (1887)).

PARSONS COLLEGE, located at Fairfield, Iowa, established in 1875 under the control of the Presbyterian Church. In 1855 Lewis B. Parsons of Buffalo, N. Y., bequeathed \$37,000 to "endow an institution of learning in the State of Iowa." In 1874 the Presbyterian Synod of Iowa and the people of Fairfield donated \$30,000 to a fund for the establishment of a college in that city, with the aid of the Parsons endowment. The work of the college is arranged in three courses, classical, scientific and philosophical, which lead respectively to the three degrees of A.B., B.S., and Ph. B.; there is also a normal training course, a business course and a preparatory department. The productive endowment of the college was in 1914, over \$230,000 a year; and the buildings were valued at considerably over \$220,000.

PARTAB, or PERTAB NARAYAN SINGH, Sir Maharaja, an Indian Prince: b. 1855. The grandson and successor of the famous Maharaja Man Singh of Mahdauna, who was prominent during the Indian Mutiny. Sir Partab comes from an ancient Rajput family of warriors distinguished by its loyalty to Great Britain. In 1878 he went to Kabul as a member of the mission under the leadership of General Sir Neville Chamberlain, and in 1897 accompanied the Mohmand expedition as aide-de-camp to General Ellis. In 1898 he served in the same capacity with General Lockhart in the Tirah campaign on the Indian Northwest frontier. When Indian troops were being sent to quell the Boxer rebellion in China in 1900, Sir Partab persuaded Lord Curzon, then Viceroy of India, to let him accompany the expeditionary force. On the outbreak of the European War the old warrior, though in his 60th year, insisted on fighting with the British in Europe, taking with him his nephew, a youth of 16. He actually served at the front throughout the whole course of the war, expressing his desire to fall on the battlefield. During two terms as regent and one as Prime Minister he ruled over Jodhpur, an Indian state three times as large as Belgium, and from 1902 to 1911 he reigned as Maharaja of Idar, a state of 2,000 square miles in the Bombay Presidency. He voluntarily abdicated the throne in favor of his adopted son in order to assume the regency of Jodhpur. That came to an end in 1916, and Sir Partab, after a brief visit to India, returned to the Western front, to devote himself entirely to fighting. He is a member of the Legislative Council of the Northwestern Provinces of Oudh.

PARTERRE, pār-târ', in old French gardens, the open part in front of the house or dwelling, in which flower beds and closely cut lawn were intermingled according to a regular plan. Also a name for the pit or orchestra space in French theatres.

PARTHENIUS, pār-the'ni-üs, Greek elegiac poet and grammarian of the 1st century B.C. He was a native of Nicæa in Bithynia, was taken to Rome as a prisoner in the war with Mithridates; but he was soon freed, and became the friend, possibly the Greek teacher, of Virgil, and the intimate of Cornelius Gallus. Virgil borrowed from him a line in the first Georgic (437). For Gallus he composed, in prose, a resumé of love myths suited for elegiac

poetry, which still exists under the title *Περὶ ἐρωτικῶν παθήματων*, 'On Love's Sufferings,' and is edited in Sakolowski and Martin's 'Mythographi Græci' (1896-1902). Only a few fragments of his many poems, elegies, epicedia and other literary work, remain.

PARTHENOGENESIS. When an embryo develops from an egg without fertilization, the phenomenon is called parthenogenesis. Instances of parthenogenesis are found in all groups of plants from the algae to the highest flowering plants, but the most thorough studies have been made in the ferns and flowering plants. In the water fern, *Marsilia*, the egg is usually fertilized normally, but sometimes develops without fertilization. The parthenogenetic behavior may occur spontaneously, but may be induced by excluding sperms and raising the temperature or by chemical stimulation. In any case, it is easily determined whether the embryo has resulted from a fertilized egg or from an egg without fertilization; the normal embryo being capped by a mass of mucilaginous material resulting from the disorganization of the neck cell and ventral canal cell, while both these cells appear intact above a parthenogenetic embryo (Figs. 1 and 2).

FIG. 1.—*Marsilia*. Archegonium containing a normal embryo: the section shows eight cells of the embryo *m*, and mucilaginous mass formed by the disorganization of the neck canal and ventral canal cells. Greatly magnified.

FIG. 2.—Similar figure of a parthenogenetic embryo: *n*, neck canal cell; *v*, ventral canal cell. Greatly magnified.

Similar cases of parthenogenesis have been found in several of the common ferns. In the Gymnosperms, parthenogenesis is extremely rare and no case has been described in very great detail; but in the Angiosperms, detailed investigations have been made in various groups. It is interesting to note that the common dandelion is regularly parthenogenetic, the embryo developing from the egg without fertilization. In this case, no reduction of chromosomes (see CHROMOSOME) precedes the formation of the egg; consequently, the egg has as many chromosomes as if a normal egg, with the reduced number, had been fertilized by a sperm. It is not known what stimulus starts the development. Some species of Everlasting (*Antennaria alpina*) are always parthenogenetic while others (*Antennaria dioica*) are just as regularly fertilized in the normal way. In the parthenogenetic forms, there is no reduction of chromosomes; while in normal forms, the reduction takes place, so that the egg has the reduced number, which is doubled by the entrance of the sperm. In the Meadow Rue (*Thalictrum purpurascens*), the egg sometimes develops

parthenogenetically and sometimes is normally fertilized, so that this species illustrates the transition from normal fertilization to parthenogenesis. The egg which is to develop parthenogenetically has twice the number of chromosomes characteristic of the normal egg. The Hawk Weed (*Hieracium*) is parthenogenetic. Gregor Mendel, whose name has become famous, so that we speak of Mendelism and Mendelian hybrids, crossed species of *Hieracium* and was uneasy because the results did not agree with his work on peas. He did not know that the plant was parthenogenetic and that the pollen, which he applied with such patience, did not take effect. There are cases of parthenogenesis in the lower plants, like *Chara crinita* (Stonewort) among the algæ and *Saprolegnia* (Water Mold) among the fungi. In some familiar laboratory types, like *Spirogyra* and *Zygnema* (Algæ) and *Mucor* (Fungi), where the two conjugating gametes are alike in size and shape, a union sometimes fails to take place and a gamete rounds off and forms a spore without any fusion. Such spores are called parthenogenetic spores or azygospores. In any case, parthenogenesis is to be regarded as a sport or freak, a deviation from the normal course of development. Consult Coulter and Chamberlain, 'Morphology of Angiosperms'; Overton, J. B., 'Parthenogenesis in *Thalictrum purpurascens*' (*Botanical Gazette*, Vol. XXXIII, 1902, p. 363).

CHARLES J. CHAMBERLAIN.

PARTHENON, The. See ATHENS.

PARTHENOPE, in Greek mythology, a siren cast up by the sea on the shore of Naples. She was said to have drowned herself for love of Ulysses. Parthenope, the ancient name of Naples, was connected with this myth. The name Parthenope was also borne by the daughter of Stymphalus, with whom Hercules was in love.

PARTHENOPEAN (par'thě-nō-pē'an) **REPUBLIC**, a name given to the state into which the kingdom of Naples was transformed by the French republicans in 1799. This name was chosen because in the earliest times the city of Naples was called Parthenope. Ferdinand I, king of the Two Sicilies, having joined in 1798 the coalition formed against France, the French general, Championnet, entered Italy at the head of an army, and after having defeated the Austrians in Rome, he invaded the Neapolitan territory and took Naples, 23 Jan. 1799. The republic was then proclaimed, and though at first the change of government was far from being relished by the Neapolitans, they very soon became reconciled to it. It was, however, very short-lived, for on 20 June Cardinal Ruffo, at the head of a mixed body of troops, took possession of the city, and the republic, which had existed only five months, terminated.

PARTHIA, in classical geography, either all the region between the Euphrates and Oxus rivers and the Caspian Sea and the Indian Ocean, or, in a narrower usage, the district bounded by Media, Hyrcania, Ariana, Margiana and the Caramanian desert. The latter use of the term applies to the original home and the former to the empire of the Parthians, who seem to have been of Turanian stock migrating from Central Asia into Iran, where

they learned an Aryan tongue, practically equivalent to Persian. The capital city of the Parthians was Hecatompylus; the main product of the country, its splendid horses; and the chief characteristic of the nomad and simple living Parthians, their skill in cavalry battle, notably their ruse of pretended flight, in the midst of which they shot backward from their unerring bows—the origin of the phrase "a Parthian shot," of which "parting shot" seems a corruption. They were subdued in succession by the Assyrian, Median and Persian monarchies, then fell to Macedon and to the Seleucidæ, but in 250 B.C. they established their independence of the Syrian kingdom of the Seleucidæ after a successful revolt led by Arsaces, who claimed to be of the Persian royal line, and, backed by the Magi, became the first king of the new realm and conquered to the Indus in the east and to the Caspian in the west. This spread of the old Persian national religion and of the new Parthian empire was most successfully carried out by Mithridates I, king 174–136 B.C. The inevitable clash with Rome came in 53 B.C., when Crassus' army was annihilated at Carrhæ. Ventidius gained a slight victory over the Parthians in 38, but Antonius was severely defeated in 35, and no Roman army won a decisive victory over them until 115 A.D. in the reign of Trajan. Even then Rome gained no permanent footing in the Parthian empire. In 217 at Nisibis a battle was fought which gave neither side the victory and assured peace. In 226 the Arsacid dynasty came to an end with the defeat of Artabanus IV, and the Persian Sassanidæ became rulers of the country. Members of the Parthian royal family continued to maintain their power in the mountainous districts of their native country, more especially in Armenia, for several centuries, where they were protected by the Romans for political reasons. Consult Gardner, P., 'The Parthian Coinage' (London 1827); Rawlinson, 'The Sixth Great Oriental Monarchy' (1873), and 'The Story of Parthia' (in 'Story of the Nations' series, 1893); Wroth, W., 'Coins of Persia' (London 1903).

PARTICULAR BAPTIST. See BAPTISTS.

PARTINGTON, Mrs. An American humorist. See SHILLABER, BENJAMIN PENHALLOW.

PARTITION, in law, is the division which is made between several persons who own land, goods, chattels or other property which belong to them as coheirs or coproprietors. Technically it applies to the division of real estate between copartners, tenants in common, or joint tenants, and the object is to establish that to which each of the coproprietors is severally entitled. Voluntary partition is made by the owners of an estate, by the conveyance of such part to each other which is to be owned by him. Compulsory partition is effected through special laws providing that remedy. Any kind of property or thing of value, whether real or personal, which is the subject of joint ownership can be the subject of partition, the right of partition being an incident of joint ownership. In law it has been held that a husband and wife, being one, cannot partition an estate held by them. This has been largely remedied by the married woman's acts. In any event this could be accomplished by conveying

it to a third, who could reconvey to each in equal shares. Occasionally the question of division is left to arbitration. A partition is often effected by a single deed executed by all the parties in interest, whereby to each is assigned a share, or else by mutual conveyances between the parties. Generally the same effect is given to an agreement for partition as to an act of partition. Partition by judicial proceedings is frequently effected by an ordinary action at law. In the United States the practice in these cases is usually regulated by statute. The title of an applicant for partition to possession must be clear or the action cannot be maintained. The fact that property sought to be partitioned is subject to liens, easements, or a lease, will not generally prevent partition. Mines, mill privileges, water power, and oil and gas under the surface of the earth, have all been the subject of partition proceedings. The courts have refused to partition property which would impair its usefulness to the public. The court in granting relief through partition proceedings does not act ministerially and its object is to adjust equitably the rights of all the parties in interest. See TENANCY; REAL PROPERTY.

PARTITION TREATIES, the name given two treaties made between France and England and the Netherlands in 1698 and 1700, for the settlement of the Spanish Succession. See TREATY AND TREATIES.

PARTNERSHIP, has been variously defined, in one instance as "a voluntary contract between two or more legally competent persons, to place their money, effects, labor, skill, or some or either of them, in lawful commerce or business, with the agreement that there shall be communism of the profits thereof between them." However, it would hardly be possible to form a definition that would meet every case. Contract between partners is essential; it may be verbal or in writing, and the partners must have accepted its terms. An agreement to share profits is an element essential to partnership, and if such does not exist there is no partnership. The manner of sharing the profits controls the test of partnership. One cannot against his will, or by the conduct of others, be made a partner, but in some jurisdictions under certain circumstances one may be held liable to third parties as a partner, who receives a share of the profits in place of some other consideration. The accepted rule is that persons sharing the profits of a business are not liable as partners to third persons, unless they are in fact partners or have so conducted themselves as to hold out to the public that they are partners. In the United States the commercial idea is that a partnership or firm is an entity separate and distinct from the members composing it. It is so treated in accounting, indebtedness being entered against the firm and not against the individual members. Within the firm itself, accountants make the firm debtor to each partner for what he contributes to the common stock, and each partner is made debtor to the firm for all that he takes out of that stock. Thus partners do not become debtors and creditors of one another as to the firm's business, but are always debtor to or creditor of the firm. The partners are regarded as agents of the firm for the transaction of its business, and sureties of the firm in case of its

failure. This commercial view, however, is not established in the law, where the partnership is not recognized as distinct from its individual members. The law regards each partner as acting as principal for himself, and as agent for each of the other partners. To this variance between the commercial view and the legal view is to be attributed much of the conflict of authorities in various States on the many important questions involved.

Partnerships are grouped for classification under four heads: general, special, limited and joint-stock. The general partnership is the association most commonly found in business. The special partnership is one formed for a particular transaction: it is often called a particular partnership. A limited partnership is one in which the liabilities are not equal as between the partners, but limited as to some of them. A joint-stock company is a partnership in which the interests of the partners are represented by shares which may be transferred to other owners without dissolving the partnership.

A secret partner is one whose relation to a firm is unknown to the public, and a silent or dormant partner is one who takes no active interest in the management of the business affairs of the firm, but receives a share of the profits. A nominal partner is one who, though known as a partner, does not share in the profits. A liquidating partner is a member of a partnership which has dissolved, who has charge of winding up the affairs of the company. A special partner is one who is a member of a firm under a statutory limitation.

It must be borne in mind that the existence of a partnership depends upon questions of both law and fact, and that the proper determination of these questions is frequently the subject of conflicting opinions of upper courts. A nominal partner is one who, though known as that in all cases, the question of the existence of a partnership depends on the agreement between the parties and their intention as same may appear from all the surrounding facts. Persons receiving a debt, the payments on account of which are measured by the profits of a business, are not partners; neither is one a partner who is employed as an agent or servant, and receives a part of the profits as his remuneration, but the investment of capital in the business, in addition to rendering services, tends to show the relation of a partner rather than that of employee. Participation in losses tends to show a partnership, but the absence of it tends to show merely a loan; sharing expenses or losses alone does not constitute a partnership. One lending money to another engaged in conducting a business, under a contract to receive a part of the profits in the place of interest, or in addition to the interest, is not a partner, unless he has the usual rights and powers accorded to a partner; one receiving a fixed amount, having no relation to the profits, in consideration for services or property, is not a partner. An important distinction exists between sharing gross receipts and net profits; sharing the former is not evidence of partnership, neither is the division of the results of a joint venture, such as raising a crop. Proof as to the conduct or relation of the parties may be such as to show the existence of a partnership, such as the fact that the alleged partner

assumed charge and direction of the business; the conducting of the business under a firm name and the keeping of partnership books may all tend to prove the existence of partnership. Clubs, associations, societies, etc., formed for the purpose of social or political objects and not for profit, are not partnerships. The joint owning of property from which they obtain a profit from its use, does not necessarily constitute a partnership of the owners but may become such through an agreement to carry out a joint venture in which the owners share in the profits and losses.

In entering into a contract of partnership all the general rules of law governing contracts are applicable; generally such contracts are not required to be in writing, except in the case of some statutory provision. In many jurisdictions it is held that a partnership, the object of which is to own or deal in realty, must be set forth in writing. As title to real property cannot be legally vested in the firm, it is held by one of the individual members in trust for the firm. Hence the widow of a deceased partner has been held to have dower rights in such real estate after the firm's debts are paid. A partnership that is to begin after the expiration of one year must be in writing, and it is advisable that a contract for a partnership which is to last for a longer term than one year be in writing. Persons who can make a valid contract are capable of entering into partnership. One not of age may become a partner, but would have the right to rescind his contract, as same would be voidable. A partnership with an insane person is valid, if the parties to the contract were ignorant of the condition of the insane person. A married woman may become a partner, and in some jurisdictions, the partner of her husband. No corporation can become the partner of a person, or any other corporation, unless its charter so permits. Any number of persons may form a partnership. A partnership is void which is created for any object or purpose which is prohibited by law, or which is contrary to public policy. In the absence of a statute authorizing a firm as such to sue, an action must be brought in the individual names of the partners; the same is true of actions brought against partnerships. A firm name is not necessary in law, although it is generally adopted as a matter of commercial etiquette; such name cannot rightfully be used for any purpose other than that connected with the partnership transactions. The firm name is not a part of the "property" of the firm, but is a part of the "good-will." It thus has a salable value and so is one of the assets of the firm. A purchaser of the good-will of a firm buys the right to use the firm's name. One partner acting for the firm binds the other partners.

The capital of a firm is the sum contributed by the members for the purpose of conducting the partnership business, and is distinguished from the partnership property, which includes everything that the firm may own; the capital may consist of money or property, or the use of property, and may be contributed in different amounts. Upon the dissolution of a partnership the capital is returned, and the proportionate profits, as agreed, divided. In the event of the death of a partner the assets of the firm vest in the surviving partners, and it becomes the duty of the surviving partner, or partners, to

settle up the business, and to account to the representative of the deceased partner for his interest.

A partnership may be dissolved, changed or modified at any time by the members, provided that such is not contrary to law. The failure of a partner to fulfil the terms of the agreement of partnership does not necessarily nullify the agreement, but it may be the basis of an appeal to the court for a dissolution. Each partner has the same right to share in the management of the business unless otherwise stipulated in the agreement. The law imposes a very strict duty on the part of partners, their relations with each other, and absolute good faith is demanded; one partner is liable to the others for a strict account of all matters conducted by him that are within the general scope of the business of the partnership. A partner will not be allowed to buy for his personal benefit a claim against his firm but will be held to have bought it for the benefit of his firm, nor will a partner be allowed to obtain a renewal of a lease of the premises occupied by his firm, or to deal in the property of the firm for his own benefit, and if he uses the firm's funds for speculating, he must account to the firm for the money and for the profits. A partner must account for any benefits obtained by him from the information secured in the course of the business of the partnership. Except that the agreement prohibits it, a partner may engage in a business which does not compete with the business of the partnership and is not inconsistent with his duties as a partner. A member of the firm is not entitled to any compensation for extra services under any circumstances, except in the case of an agreement, unless it is necessitated by the wilful negligence of his partner. The partners have a right to insist that accurate accounts be kept of all the transactions of the firm and legally they have access to the books at all times.

Unless there is some agreement to the contrary, the acts of the majority control. The rights of the minority, however, must be afforded every protection and they must have an opportunity of presenting their objections. Members of a firm cannot expel a partner unless that right is given by their agreement. A partnership is liable for any loss or injury caused to one who is not a member of the firm by one of the partners acting in the ordinary course of the firm's business or with its authority; the partnership is also liable for money misapplied by one member of the firm who is apparently acting for it. A judgment creditor can proceed against the individual property of partners without first obtaining execution against the firm property, except that this be contrary to the provisions of the statute governing the partnership.

A partnership may be dissolved at any time by mutual consent, and unless so dissolved the partnership does not terminate until the partners cease to carry on the business. It may be dissolved by the court when one of the partners refuses consent upon various grounds—unprofitableness of the business, fraud, damaging conduct, etc. On the dissolution of a partnership it is desirable to give public notice, this prevents a partner becoming liable to third persons for the acts of his former partners. Partners cannot sue each other in law but

courts of equity have jurisdiction to demand accountings and to make a settlement of partnership affairs. Any change in the membership of a partnership effects a dissolution, and if the business continues it is a new firm. See also AGREEMENT; CONTRACT. Consult Burdick, F. M., 'The Law of Partnership: Including Limited Partnership' (Boston 1917).

HENRY M. EARLE.

PARTNERSHIP ASSOCIATIONS. See CORPORATIONS, LEGAL.

PARTON, Arthur, American artist: b. Hudson, N. Y., 1842; d. 1914. He began landscape painting as a pupil of W. T. Richards in Philadelphia, and has developed a particular talent in the portrayal of scenery in clouded sunlight, or the semi-darkness of declining day. He has been charged with subduing his landscapes with too prevailing a gray tone, but his handling is vigorous as well as imaginative. All his pictures are pleasing and suggestive. This is seen in his 'Nightfall' (1881); and his 'Palisades in Winter' (1885); 'Loch Lomond'; 'Night in the Catskills'; 'Evening—Harlem River'; 'The Ledge' (1913); and 'A Spring Morning' (1914).

PARTON, James, American author: b. Canterbury, England; 9 Feb. 1822; d. Newburyport, Mass., 17 Oct. 1891. He was brought to the United States in 1827 and received his education here. His first literary employment was on the staff of the *Home Journal* of New York. In 1855 appeared his 'Life of Horace Greeley,' of which over 30,000 copies were sold, and which was followed in 1857 by his 'Life of Aaron Burr.' Of this work nearly 20,000 copies were sold during a period of great commercial distress. His success decided him to make literature his life work and this he combined with lecturing on political and literary subjects. In 1875 he removed from New York to Newburyport, Mass. He married Sara Payson Willis (Fanny Fern) a sister of N. P. Willis; and on her death in 1872 he married her daughter by her former husband, Charles E. Eldridge. It was followed by 'Life of Andrew Jackson' (1859-60), a collection of 'Humorous Poetry of the English Language, from Chaucer to Saxe' (1856); 'General Butler in New Orleans' (1863); 'Life and Times of Benjamin Franklin' (1864); 'Famous Americans of Recent Times' (1870); 'Washington' (1872); 'Fanny Fern' (1873); 'Life of Thomas Jefferson' (1874); 'Life of Voltaire' (1881); 'Thomas Jefferson' (1874); 'Caricature and Other Comic Art' (1877); 'Noted Women of Europe and America' (1883); 'Captains of Industry' (1884); 'Triumphs of Enterprise, Ingenuity and Public Spirit' (1871); 'Topics of the Time' (1871); 'Caricature in all Times and Lands' (1875). He was an extremely entertaining writer and a literary force in his day.

PARTON, Sara Payson Willis ('FANNY FERN'), American writer, sister of N. P. Willis (q.v.), and wife of James Parton (q.v.): b. Portland, Me., 9 July 1811; d. Brooklyn, N. Y., 10 Oct. 1872. Married early to C. E. Eldridge of Boston and left at his death dependent upon her own resources, she turned to literature, and under her pseudonym, 'Fanny Fern,' soon became widely known. 'Fern Leaves,' the first of her collection of sketches, was published in

1853 and 70,000 copies were sold in a short time. This was followed by 'Little Ferns' (1853); 'Fern Leaves, 2d Series' (1854); 'Ruth Hall,' a semi-autobiographical novel (1854); 'Rose Clark' (1857); 'Fresh Leaves' (1857); and 'The Play Day Book' (1857), all of which once enjoyed a considerable popularity, some of them being translated into French and German. For 16 years she contributed a weekly article to the *New York Ledger*. She was married to James Parton in 1856.

PARTRIDGE, pār'trij, Alden, American educator and soldier: b. Norwich, Vt., about 1785; d. there, 16 Jan. 1854. He was graduated at West Point in 1806 and acted as assistant professor and afterward professor of mathematics there from that time until 1813. He was professor of engineering 1813-16 and superintendent from January 1815 to November 1816 and from January to July 1817. He resigned in 1818 and became the principal of an exploring survey sent out in 1819 to determine the north-west boundary of the United States. In 1820 he founded in his native town the American Literary, Scientific and Military Academy (known as the Norwich Military Academy). In 1834 this was granted a charter by the State and incorporated as Norwich University, with Partridge as its president. At the invitation of other States he subsequently founded similar institutions in Harrisburg, Pa., Portsmouth, Va., Pembroke, N. H., and Brandywine Springs, Del. He was surveyor-general of his native State in 1832 and a member of the Vermont legislature in 1833-34 and 1839.

PARTRIDGE, Bernard, English artist and cartoonist: b. London, 11 Oct. 1861. He was educated at Stonyhurst College and was engaged in stained-glass designing and decorative painting in 1880-84. From 1884 he has occupied himself in illustrating for the press and for book publishers. Since 1891 he has been with the *London Punch*, of which he is chief cartoonist.

PARTRIDGE, John, English astrologer and almanac maker: b. East Sheen, Surrey, 18 Jan. 1644; d. Mortlake, Surrey, 24 June 1715. He was bound to a shoemaker in early youth but contrived to teach himself Latin, Greek and Hebrew, by means of which he gained a knowledge of astrology and he seems to have studied medicine at Leyden. In 1680 he issued the first of his almanacs, 'Merlinus Liberatus,' which with its rarely perfect equivocation soon gained popular favor and quack imitators. Swift, in 1708, prompted in part by a spirit of jest and wishing also to check the flood of quack almanacs, published his 'Predictions . . . by Isaac Bickerstaff,' in which he prophesied the death of Partridge at 11 o'clock at night on the 29th of March. On the 30th he published the announcement of the fulfilment of the prophecy; so thoroughly convincing the public of its truth that Partridge was unable to establish the fact that he was living and he made no further issues of his almanac until 1714, probably deterred by Swift's continuance of the jest in 'Elegy on the Death of Mr. Partridge' (1708) and 'Vindication of Isaac Bickerstaff' (1709). The name Isaac Bickerstaff was taken by Swift from a sign in Longacre. Steel made use of it in the *Tatler* in 1709; and others used it in signed newspaper and periodical articles for many years.

PARTRIDGE, William Ordway, American sculptor and author: b. Paris, France, 11 April 1861. He studied at Columbia University and then received his art education at Paris, Florence and Rome. Adelphi College, Brooklyn, N. Y., conferred on him the degree of M.A. also. Among his works of sculpture are 'General Grant,' an equestrian statue for the Union League Club, Brooklyn; the statue of Alexander Hamilton, Brooklyn; the group, 'Christ and Saint John,' in the Brooklyn Museum of Fine Arts; the statue of Hamilton and the Schermerhorn Memorial at Columbia University; the statue of Shakespeare and the bust of Edward Everett Hale at Chicago; the Kauffman Memorial, and the baptismal font in the church of Saint Peter and Paul at Washington, D. C., and others. He has written 'Art for America'; 'The Long Life of a Sculptor'; 'The Technique of Sculpture'; 'The Angel of Clay'; 'Nathan Hale, the Ideal Patriot'; 'The Czar's Gift'.

PARTRIDGE, a name properly designating a common European game-bird (*Perdix cinerea*) but applied with little discrimination to a variety of gallinaceous fowls. In the United States the name is given to the ruffed grouse and spruce grouse and with greater appropriateness to a number of birds more or less closely resembling the European partridges and quails. (See GROUSE.) Taken in the wide sense the family *Tetraonidae* includes all of these birds, the American partridges being the subfamily *Odontophorinae*, which is sometimes united with the Old World partridges under the name *Perdix* or *Perdicidae*. The latter comprises about 150 species, distinguished by the absence of the serrated edge of the lower mandible, common in the American types. They avoid woodlands and are commonly found in cultivated grounds in groups up to 20 or 25 birds. The *Odontophorinae* have the bill very short and thick, more so than in the European partridges. Like them, the nostril is covered by a scale, but is not filled with short feathers. The lower mandible is more or less distinctly toothed near the end. Both toes and tarsi are naked and the latter scaly, which characters, with the completely feathered head, offer a ready distinction from the grouse. This group is strictly American, but most of the 40 or 50 described species are confined to Central and South America. Many of the species have the head ornamented with graceful crests of very characteristic forms in the different genera; and remarkably rich and varied color-patterns occur, especially in the males of those species in which the sexes differ. Seven species representing four genera and divided into a number of subspecies and local races, are found within the boundaries of the United States. With a single exception all are western and southwestern and most of them may be considered as an overlapping of the Mexican fauna.

The exception just noted is that of the most prominent and familiar of these birds—the bob-white, which is popularly, if unfortunately, known both as partridge and quail and is described in this Encyclopedia under QUAIL.

Of the western species the mountain partridge or plumed quail (*Oreortyx pictus*), of the Pacific coast region, especially the mountainous parts of California, Oregon and Washington,

is distinguished by the pair of slender black plumes which ornament the head. Those of the male are nearly four inches long and curve gracefully backward; in the female they are much smaller. The extremely handsome colors are similar in the two sexes. These birds are not well known to gunners, are extremely wild, and the coveys scatter quickly by running, taking wing only when hard pressed, when they rise and fly with extreme swiftmess. The call of the male is a pleasant whistling note. The eggs are buff-colored. The California partridge or helmet-quail (*Lophortyx californica*) has a crest of several club-shaped feathers, which are erect and curve forward. The male is very richly adorned with soft grays, warm browns and slaty blues, variously marked with black and white. The female is much plainer and has a smaller crest. They have been seen in flocks numbering 500. A paler, grayer variety (*L. c. vallicola*) is known as the partridge or valley quail of California and it has been introduced into the Pacific States northward. When flushed, this species is said almost invariably to fly into a tree. Its notes are harsh and very peculiar. The eggs are spotted and laid in a very carelessly made nest or on the bare ground. Gambel's partridge (*Lophortyx gambeli*) is similar to the last, from which the male is distinguished by the greater amount of black in the plumage, particularly on the face and belly. It is exceedingly abundant in Texas, Arizona and New Mexico, from which it spreads through the surrounding States, especially into California and Nevada. It is equally at home in the mountains and lowlands. The Massena partridge (*Cyrtonyx montezumae*), also known as the "fool quail" because of its failure to sense danger and make an escape from the hunter, is a bird of Mexico rather than of the United States, within which it is found only in western Texas, Arizona and New Mexico. The sexes are very unlike, the male having the sides of the head white fantastically striped with black, and the under-parts dark thickly spotted with white. The crest is depressed, brush-like and on the occiput. Many of these partridges are extremely variable and numerous subspecies and races of some of them have been described. They are also said to readily hybridize, at least under domestication. The several crested and plumed partridges described give a fair picture also of those occurring in South America, most of which belong to the same or similar genera.

The partridges of the Old World are not clearly distinguished as a group from ours. They are found in most temperate and tropical countries from England and China to Australia.

The common or gray partridge (*Perdix cinerea*) chiefly inhabits the cultivated fields of Britain and the Continent. Mating takes place in February, the males frequently engaging in combats for the possession of the females. The eggs, numbering from 10 to 15, are deposited at the end of May or beginning of June, the female taking upon herself the entire duties of incubation, although the male, after the young birds are hatched, shares the duties of his mate. The partridges are exceedingly solicitous regarding the welfare of the young. The parent birds will run before the sportsman and by fluttering in an opposite direction will strive to

distract his attention from the neighborhood of the nest. Selby mentions that he has seen two partridges successfully engage a carrion-crow in battle in defense of their young. These birds in autumn and winter collect in flocks of small size, known as "coveys," but they separate in spring to pair and incubate. The food consists chiefly of grass, young seeds and also of insects; and the birds feed in the early morning and late in the evening. The roosting place of the covey is generally in the middle of a flat field.

The red-legged partridge (*Caccabis rufa*) is common in certain parts of England, having been introduced from the Continent, where it is common. It is found in France, southern Europe generally, and in Guernsey and Jersey. The flesh is of a less succulent and tender character than that of the common partridge. It inhabits healthy places chiefly, but otherwise closely resembles its more familiar neighbor in habits.

The true English quails belong to the genus *Coturnix*, which has the nostrils feathered beneath the covering scale, the bill more slender than in the partridges, the wings somewhat pointed and the tail very short. They are migratory and thus have spread very widely. The common or Messina quail (*C. communis*) is colored much like our bob-white but is smaller, more slender and far inferior from a sportsman's point of view. Rather extensive attempts have been made to introduce the quail into the United States but, in part owing to its migratory habits, in part to the changed conditions they have failed. Naturally this species inhabits a large part of Europe, Asia and Africa. Except for the fact that it is migratory and does not form coveys, its habits are closely similar to those of the bob-white (see QUAIL).

The partridges are readily domesticated and even in the wild state will frequently associate with fowls in the barn yard when food is scarce in the winter. The eggs may be secured and incubated under a bantam hen which naturally cares for the young. Besides the bob-white many of the crested partridges have been thus bred and are familiar sights in the aviaries of zoological gardens and bird fanciers. Consult Knowlton, F. H., 'Birds of the World' (New York 1909).

PARTRIDGE-BERRY, CHECKER-BERRY, or SQUAWBERRY, a perennial evergreen trailing vine (*Mitchella repens*) of the family *Rubiaceæ*. It is a native of North America and is found from Nova Scotia to Florida and westward to Minnesota and Texas. The leaves are round, small and glossy; the flowers white or pinkish, tubular, in pairs and very fragrant; the fruits bright scarlet, often two united in one, persistent during winter, almost flavorless. In shady places, on dry soil, the plants seem to thrive best; they are, however, found in moist situations. They are favorites in rockeries and wild gardens and are easily propagated by root-division. The genus, which comprises very few species, one Japanese, another South American, is named in honor of Dr. John Mitchell, one of America's early botanists, a Virginian correspondent of Linnaeus. The names partridge-berry and checker-berry are also sometimes given to *Gaultheria procumbens*, which is better known popularly as wintergreen and boxberry.

PARTRIDGE PIGEON, or SQUATTER PIGEON (*Geophaps scripta*), a habitant of the interior of Eastern Australia. It is a light brown above with three black bars on the side of the head. Like the bronze-winged pigeons it has a large metallic area on the wing coverts, but this is greenish to purple instead of bronze. The partridge pigeons are found usually in pairs, or in small companies, and live wholly upon the ground. See also BRONZE WING.

PARTRIDGE-WOODPECKER, an occasional local name for *Colaptes auratus*, the eastern golden-winged woodpecker or flicker. See WOODPECKER.

PARTY ORGANIZATION IN LEGISLATIVE BODIES. Party organization in the United States is extra-constitutional. That is, American constitutions, State and national, make no provisions for parties and party leadership. Indeed, it would be safe to say that early American statesmen did not encourage or facilitate party organization and control. In England, on the contrary, and in other countries in which the cabinet system of government prevails, party organization is part and parcel of the government itself. The Prime Minister and his cabinet are the leaders of the majority party in Parliament and hold office often by reason of that leadership; the opposition party is equally well recognized; and therefore the parties which hold power can be held rigidly accountable for the use to which they put that power. But while it was possible to avoid making definite provision for political parties in American government, it was not possible to prevent their development or to stop the exercise by them of important powers in administering government. Consequently, in the United States we have not abolished the political party nor its power and influence; we have not been able to get along without it; we have merely, by refusing to give it a recognized place in our governmental system, compelled it to work indirectly and informally. The result has been that the organization of parties in our legislative assemblies has been carried on by party leaders perhaps not themselves the members of any legislative body and not responsible in any open or direct way for their conduct.

Purposes of Party Organization.—Party organization in legislative bodies seeks to accomplish two main purposes. The first of these is the control of legislative policy in such a way as to further party interests. If a party has succeeded in electing a majority in the legislature by going before the people on a definite platform of proposed legislation, it is highly important that the party effect an organization in the legislature that will enable it to redeem its campaign pledges. Secondly, the party leaders wish to be in a position to distribute to loyal party members the patronage available in the selection of the officers, committeemen and other attractive positions which form a part of the formal organization of the legislature. It is important also for the party to capture these

places if it is to hope to control legislative policy effectively.

The Machinery of Party Organization.

—(a) *The Party Leaders.*—There must be party leadership in order to insure the efficient carrying out of party policy. That leadership may assert itself in several ways. In the first place it may rest upon the shoulders of one man, the boss. Usually the party boss has built up a strong grip on the party, personal in character, and too often by methods which will not bear the light of publicity. He is usually unwilling to expose his past record to the scrutiny of a campaign for public office and contents himself with remaining a private citizen, exercising control over those whom by his power he has placed in office. It is very seldom, in fact, that the boss actually becomes a member of a legislative body or holds any office in it. The organization of the legislature is, however, his work, and the nominal leaders receive their instructions from him. However, the era of the more or less irresponsible party boss is passing away, and as political parties have become more democratic in character party leadership is apt to fall on the shoulders of a man chosen for that purpose by his associates, either by common consent or by formal election. If the party has a majority in the legislature, the party leader will frequently, though not invariably, become speaker of the lower house because of the opportunities open to the speaker to control legislative procedure in the interests of the party. However, it is sometimes more advantageous to have the recognized party leader occupy the chairmanship of one of the most important committees, such as the committee on ways and means in Congress or revenue and taxation in a State legislature. When the party is in the minority in the legislature it does not have the power to secure for its leader any official recognition, but it designates him as its floor leader or "minority leader" and places upon him the responsibility of looking after the party interests in debate and various other matters.

(b) *The Caucus.*—The party caucus is the whole group of party members in a legislative body meeting to determine party policy. As the autocratic boss declines in power and the party becomes more democratic in organization, the caucus takes on more and more authority. Party caucuses have been more influential in governing the policies of Congress where party leadership has been less centralized than in State legislatures, where the boss or an oligarchy of bosses has more frequently thrived. The caucus in the main does two kinds of work. It may create the formal party organization by naming its candidates for speaker, committee chairman and so forth. In many cases the caucus in so choosing the party officials merely ratifies the choice of a smaller group of party leaders who have previously met and prepared a "slate." The second function of the caucus is to determine whether the party as such shall take a definite stand upon a question of legislative policy and what that stand shall be. This goes far toward establishing a real test of party regularity, because when the party has declared a certain bill pending before the legislature to be a party measure, every member of the party is supposed to

vote for it under the heavy penalty of ostracism from the party. Of course relatively few measures are definitely party measures and upon all others no attempt is made to control the discretion of the individual member.

(c) *Committees.*—Effective party organization demands that the majority party have a majority on every legislative committee. As a rule the destiny of legislative bills rests in the hands of the committee to which they are referred. It may quietly pigeonhole a bill or delay reporting it until too late for action. The chairmen and majority members of important committees may exert enormous power over their colleagues by their power to suppress bills in which those colleagues are interested. In these committees also corruption and bribery are most likely to thrive. Persons seeking special privileges or protection from legislation which is objectionable to them may frequently achieve their desires by exerting secret and corrupt influence upon committee members. Dishonesty in such matters is hard to prevent and hard to detect. In addition to these regular legislative committees to which bills are referred, many legislative bodies provide for the appointment of special committees with unusual powers to determine matters of procedure and the order in which bills shall be taken up for action by the legislature. Such a committee is the committee on rules of the national House of Representatives; and in the State legislatures the "steering committee," as it is called, which is usually appointed at the close of the session for the purpose of deciding which of the numerous bills still pending ought to be brought up for consideration in the short time remaining. These committees have, of course, wide discretion in reporting or killing legislation, and when controlled by a political party offer large possibilities for the domination of legislative policy in the interests of the party. In general it may be said that in spite of the many evils connected with the committee system in legislative bodies, it is hard to see how committees could be entirely dispensed with.

Proposals for Needed Reform.—From the foregoing discussion it is evident that at least two evils result from our present system of party organization in legislative bodies. First, it is usually quite impossible to centre upon the party or on individuals definite responsibility for legislative evils. Second, such a system makes it easy for corruption and dishonesty to thrive undetected. While no one will claim that party influence should be eliminated from legislative bodies, there are several methods suggested by which it is hoped to eliminate the existing evils. These remedies fall into two groups. The first group comprises those which seek to fix responsibility upon the party for the good or bad results of its work. Here are to be found the proposals for the introduction of the English cabinet system into State government, the enlargement of the control of the executive over the legislative policy and the development of a budget system. By giving the party clearly defined and adequate power in legislation those schemes would make it impossible for the party to evade its just responsibility. The second group of reforms is less revolutionary in character and aims in general at the minimizing of the opportunities for cor-

ruption and illicit influence. Such are the rigorous corrupt practices acts and anti-bribery statutes, requirements of publicity in committee hearings, publication of campaign fund contributors, contributions, etc., and in other stages of legislative procedure rigorous laws forbidding or regulating lobbying.

Much valuable work is being done by various organizations, such as voters' leagues, which keep close watch of legislative proceedings and try to inform the citizens regarding the work which their representatives are doing. Little permanent reform can be expected unless it is supported by an alert and intelligent public sentiment.

PARTY SYSTEM. See CONVENTION, POLITICAL; ELECTIONS; VOTE, VOTERS, VOTING; BALLOT; PRIMARY, DIRECT; PRIMARY, PRESIDENTIAL; CAUCUS; CONGRESS; and the parties by name.

PARTY-WALL, *in law*, is the wall that separates two houses or adjoining properties. Such a wall, together with the land upon which it stands, belongs equally to the owners of the two properties, half belonging to the one and half to the other; and unless the wall has stood for 20 or more years, each can legally do what he likes with his own half, even to cutting it away. It is common practice for the party who builds a house adjoining another to pay a just proportion of the expense of the party-wall to the party who built the same. By English common law, where the wall is, as above indicated, partly on both lots or properties, the adjoining proprietors are considered as tenants in common of the wall and of the land on which it stands. Neither owner of a party wall may legally extend the walls of his building further than the middle of the party wall, or maintain a window in the side toward the wall. If a party wall is destroyed, neither party can legally (in most States) rebuild same (except upon his own land) without the consent of the other party thereto.

PARVATI, pār'va-tē, in Hindu mythology, a divinity; a daughter of the mountain, also called Durga (q.v.). The word itself in Hindu means "mountain born." She was said to be a reincarnation of Um, and she was called Parvati because she was a daughter of Himavat (Himalaya Mountains); or because simply, according to a later version or evolution of the myth, she was born in the mountains. When

born she was white, red and black, the typical colors of Brahma, Vishnu and Siva from the combined glances of whom she was born. Later she divided herself into three forms which became respectively the wives of Brahma, Vishnu and Siva. Consult Wilkins, W. J., 'Hindu Mythology' (London 1900).

PARVIN, Theophilus, American physician: b. Buenos Aires, Argentina, 9 Jan. 1829; d. Philadelphia, 29 Jan. 1898. He was graduated at the University of Indiana in 1847 and took his M.D. at the University of Pennsylvania in 1852, whereupon he established himself in practice at Indianapolis. He was professor in the Medical College of Ohio in 1864-69, at the University of Louisville in 1869-72, and was subsequently professor of obstetrics and diseases of children at the Indiana Medical College and at Jefferson Medical College, Philadelphia. He was president of the Indiana State Medical Society in 1861, and of the American Medical Association in 1879. Author of 'The Science and Art of Obstetrics' (1886). Editor of 'Winchel on the Diseases of Women' (1887).

PARVISE, the open or enclosed space in front of a church or cathedral, especially in France. When the bishop held court he summoned delinquents to appear before him in the parvise, and at Saint Rhadegunda's Church at Poitiers the episcopal court at the west end of the church is well defined with five entrances, coped wall, kneeling angels and lions. At Amiens and Liseux the raised platform of the court still remains and traces of the same construction are apparent at Lichfield. The term is also applied to a room over the porch of a church which formerly was a watch house or lookout, but which in modern times has been applied to various uses.

PARZIVAL. Wolfram von Eschenbach's 'Parzival' is a Middle High German epic composed early in the 13th century. Its verse as a rule has four accents, two successive verses always being combined by a rhyme. It is divided into 16 books and in part (books 3-12) is based on the Old French 'Perceval le Gallois' by Chrestien de Troyes. But the latter remained a fragment, and Wolfram's poem excels it by greater depth of thought and feeling, and a higher standard of morals. Originally Parzival belongs to those simpletons popular in folklore who in foolishness and innocence accomplish some great deed. This old theme is remodeled and ennobled in our poem. The hero is endowed with that virtue which the Germanic peoples consider the highest—faithfulness, and he passes through a change of mind typically Christian in character which enables him to attain his aim. The aim itself is set high and is of a double character. In its worldly aspect it is represented by King Arthur and his followers (see special article) who hunt after glory and pleasure, who indulge in heroic deeds, the worship of women, adventures, festivals and the like. In its worldly and spiritual aspect it is represented by the king of the Grail and his followers who, while doing justice to the world, try above all to fulfil the highest commandments of God. The Grail (q.v.) symbolizes this ideal, and he who comes nearest to it is to be king of the Grail. Parzival first wants to become an Arthurian

knight and then strives for the kingship of the Grail. Apart from its symbolic meaning, the Grail is with Wolfram a precious stone of miraculous power granting food at will and preserving the life of king Anfortas, if he looks at it. Its original connection with the Lord's Supper and Crucifixion can still be traced in Wolfram's poem. Book 1 and 2 deal with Parzival's parents, especially his father, Book 3 takes up the story of Parzival himself. His mother brings him up in a lonely forest, but the boy leaves her in order to become a knight. He first leads the life of a guileless adventurer until old Gurnemanz teaches him the noble laws of worldly knighthood. He wins the beautiful Kondwiramur for a wife and leaves her only in order to visit his mother. Unaware he comes to the castle of the Grail. There religious fervor and true humanity should make him ask about the wonders of the Grail and the sufferings of its king Anfortas. But regard for courtly manners controls his behavior, he suppresses the all-important questions and must leave the castle. It is true, he is afterwards received at the Round Table of king Arthur, yet on account of his behavior at the castle of the Grail he must withdraw also from the company of Arthur. Now Parzival quarrels with God because He allowed him to fall into disgrace, and sets out to win the Grail in spite of Him (Books 3-6). For years he roams about in vain, comforted only by his love for Kondwiramur. At last the hermit Trevrizent teaches him that man lives in sin and can not accomplish anything great unless called by God. In deepest humility and with a purified soul, Parzival resumes his faithfulness to God and not until now has he a chance to win the Grail (Book 9). This change in Parzival is depicted between the descriptions of the adventures of Gawain, a nephew of Arthur and first knight of the Round Table, who crowns his accomplishments by conquering the castle of the magician Klingschor and winning the love of the haughty Orgeluse, but who in spite of all his attempts fails to gain the Grail (Books 7-8, 10-13). With the 14th book Parzival comes again into the foreground. After he has defeated Gawain, he is received at the Round Table for a second time. In his half-brother Feirefis, he learns to admire pagan knighthood and is at last called to the Grail. Now he asks the decisive question about the sufferings of Anfortas. The latter recovers from his pain, Parzival is elevated to the kingship of the Grail and reunited with his beloved wife Kondwiramur. The expression in Wolfram's 'Parzival' is original and even peculiar, the thoughts have a tendency to mysticism, the outer world is given most of the space, and yet the spiritual element breaks forth in places with controlling power. For such and other reasons the poem is not easy to read. But it seems fair to say that before Dante's 'Divina Commedia,' no other poem of the Middle Ages has so much to say to the modern mind as Wolfram's 'Parzival.' Consult edition in 'Deutsche National-Literatur' (Vol. V, 1882-98); free, but excellent translation into Modern German with illuminating explanations and notes by W. Hertz (5th ed., Stuttgart and Berlin 1911); English translation by Weston, Y. L. (1894); Vogt, F., 'Geschichte der mittelhochdeutschen Literatur' (2d

ed., pages 37-41, Strassburg 1902); Golther, W., 'Die deutsche Dichtung im Mittelalter' (pp. 206-224 and 578, Stuttgart 1912).

EWALD EISERHARDT.

PAS-DE-CALAIS, pā-dē-kā-lā, France, a northeastern department bordering on Dover Strait and the English Channel. Area 2,606 square miles, five-sixths of which are cultivable. Its coast, extending about 80 miles, presents a long tract of low sand-hills, but near Boulogne it forms a lofty crumbling cliff. The interior is generally flat, and intersected by canals; the streams, too, though short, are generally navigable. The principal harbors are Boulogne and Calais; the capital is Arras. The soil, though marshy in several places, is fertile, and produces cereals, vegetables and large oleaginous crops. Its chief minerals are indifferent coal, good pipe and potter's clay, and excellent sandstone. It has numerous iron-foundries, glass-works, potteries, tanneries, bleach-works, mills and factories of many kinds.

PASADENA, pās-a-dē'nā, Cal., city in Los Angeles County, on the Atchison, Topeka and Santa Fé, the Los Angeles and Salt Lake and the Southern Pacific railroads, at the head of the San Gabriel Valley, 25 miles from the Pacific Ocean and nine miles northeast of Los Angeles. The Pacific Electric Railway connects Pasadena with neighboring cities, including Los Angeles, the Orange, Riverside and San Bernardino counties having one of the largest electric railway systems in the world. The city was settled by Spaniards in 1771. In 1873 a colony from Indianapolis, Ind., settled there and began raising fruit. In 1886 it was chartered as a city. Pasadena is a famous health and winter resort, on account of its equable climate and beautiful scenery. It is at the foot of the Sierra Madre range, which protects the city on the north and east, and on the west and south are broken ranges of high hills. It is surrounded with large fruit farms. Pasadena is a residential city, but its manufacturing establishments are substantial. They include large packing houses, drying establishments, canneries and flour mills, together with a number of smaller industries. Large quantities of fruit are exported annually. A unique feature of Pasadena is the "Municipal Farm." Early in its history, the people recognized that the question of sewerage would have to be solved in some unusual way. Far from the ocean and surrounded by hills and mountains, only the wash of Arroyo Seco to depend on for drainage, it seemed as if the beautiful healthful city would soon become the home of disease. The city purchased a ranch of about 300 acres, six miles out, and by means of a large outfall pipe, the flow from the sewers was spread upon this land. About 60 acres were planted with walnut trees, and quite a large acreage was devoted to alfalfa. Enough alfalfa was raised to supply food for the horses of the fire and street departments, and left a large overplus for sale. The prominent public edifices are the churches, schools, hotels, and municipal buildings, and Pasadena Hospital. The educational institutions are the Throop College of Technology, the Pasadena Army and Navy Academy, Academy of Holy Names, Nazarene University, Stickney Memorial School of Fine Arts, high school, many fine public and

private schools, and an extensive public library, which has seven branches in various sections of the city. In 1913 Pasadena adopted the commission form of government. The waterworks and electric light plant are owned by the city. Pop. (1920) 45,354.

PASARGADÆ, pā-sār/gā-dē, ancient capital of Persia. The origin of the name is unknown. It was originally borne by one of the most important tribes of Persia to which belonged, according to Herodotus, among other important historical personages, Darius and Cyrus. Cyrus is reported to have built, after his final victory over Astyages, a town which he named Pasargadæ, after his own native tribe. And there he erected a palace and a magnificent tomb for himself. This historical fact led to the identification of the ancient city which stood upon the Plain of Murghab, some 40 miles northeast of Persepolis on the road forming the principal highway between Shiraz and Ispahan. The ruins are surrounded by the mountain barrier of the plain, which formed its chief protection against attacks from an enemy. At Pasargadæ the Persian sovereigns were invested with the insignia of office, in the sanctuary of the goddess of war. The city being the capital was rich in material wealth and art; and for that reason it was several times plundered. All this wealth was surrendered in 336 to Alexander, who on his return from India, finding the city had been plundered in his absence and the tomb of Cyrus treated in like manner, ordered Aristobulus to restore the latter. The description of the tomb given by Aristobulus at this time has made possible its identification with the tomb of the ruins of Murghab. The information furnished by the other historians of this period relative to Pasargadæ agrees with the account of it furnished by Aristobulus. It is quite possible that a town much older than the time of Cyrus existed on the site of Pasargadæ and that the conqueror enlarged and beautified it and made it his capital, at the same time changing its name. Among the striking buildings of the ruins of Pasargadæ is a massive stone platform or stone-crowned terrace, which bears the modern name of the "Throne of the Mother of Solomon" or sometimes "Solomon's Throne." This is believed by some to have been a royal audience platform erected by Cyrus previous to his attempts to beautify the city. It may, however, have been used for religious ceremonies of a nature such that it was necessary that they should be performed in public where the assembled people could view them. In this case the platform structure may easily have belonged to the buildings of an older age than that of Cyrus. Not far away are the remains of an ancient temple, now known as "Solomon's Prison," and near this are two altars with ruins of edifices. These are of stone and evidently were used in the ancient fire worship. South of these latter is the ruined corner of a once massive building on which is the inscription; "I Cyrus the King the Achæmenian" cut in cuneiform letters in Old Persian, Elamitic and Babylonian. A ruined building nearby bears the same inscription. This latter, a vast edifice, is now locally known as "Audience (or Reception) Hall." In this pile of ruins is a shaft over 30 feet high made of limestone. By

some this is supposed to have been the site of a former palace, probably dating to the time of Cyrus. Not far away is a huge limestone monolith, five feet broad, two feet thick and over 12 feet high, on the surface of which is carved a bearded figure supposed to represent Cyrus. The figure is crowned and is depicted with two pairs of wings. The cuneiform inscription that once crowned it leaves no doubt as to the meaning of the carving, for it reads, "I Cyrus the King of the Achæmenians." This inscription was still in place during the first half of the 19th century and drawings and copies of it of that period are in existence. But the feature of the ruin in which most interest has centred is the "Tomb of Cyrus" already mentioned. This is a low stone, house-shaped building surmounting a six-tier terrace of stone, rising from a base 50 feet long by 40 feet wide. The summit of the monument is 35 feet above the ground; while the tomb proper is 18 feet high, 17 feet broad and 20 feet long. The whole is constructed of a very hard and fine limestone. Near this Tomb of Cyrus are the ruins of a building which was probably the temple and residence of the Magian priests, who were the guardians of the tomb. The identity of this tomb has been established beyond doubt through the descriptions and records left of it by persons in the train of Alexander who paid the place two visits. Consult Curzon, 'Persia and the Persian Question' (London 1902); Herzfeld, 'Pasargadæ Untersuchungen zur persischen Archæologie' (Leipzig 1908); 'Iranische Felsreliefs' (Vol. II, Berlin 1910); Jackson, A. V. W., 'Persia Past and Present' (New York 1906); Sykes, 'History of Persia' (Vol. I, London 1915).

PASAY, pā'sī, Philippines, formerly Pineda, pueblo, province of Rizal, Luzon; six miles southwest of Pasig, the provincial capital. It is on the coast road. Upon application of the municipal council, the name of the town was changed from Pineda to Pasay by the Philippine Commission in 1901. Pop. about 15,000.

PASCAGOULA, pās'ka-goo'la, Miss., city and county-seat of Jackson County, 38 miles southwest of Mobile, Ala., on the Pascagoula River and on the Louisville and Nashville and the Pascagoula-Moss Point northern railroads. The city is on an inlet of the Gulf of Mexico, which furnishes good anchorage; is in a productive fruit and lumber district; and has a fish and oyster industry. There are shipyards, and a United States government dock and naval machine shops. Pop. 6,082.

PASCAGOULA RIVER, a river of the State of Mississippi, formed in the southern part of Greene County by the junction of the Leaf and the Chickasawhay rivers. It flows south into Pascagoula Bay, Gulf of Mexico, through an estuary of two mouths. It is 250 miles long, is navigable for small steamboats for some distance, and is used as the outlet for the pine timber cut in the surrounding region for the New Orleans market.

PASCAL, pas'kāl', Blaise, French author and philosopher: b. in the old Auvergnat town of Clermont-Ferrand, 19 June 1623; d. Paris, 19 Aug. 1662. He belonged to a family connected with the magistracy, and his father and sisters were all of superior intellectual ability,

just as Pascal himself proved to be one of the greatest and most comprehensive geniuses that the world has known. His mother died when he was a mere child. Pascal's intellectual precocity soon showed itself and extraordinary stories, perhaps exaggerated by affection and admiration, are told by his sister in her biography. However, in spite of a frail constitution and over-nervous temperament, he gave himself, as he grew up, not only to social diversions but to intense intellectual study, especially to mathematics and to physics. His sister declares that he composed a treatise on sounds at the age of 12; at 16 he wrote an essay on conic sections, and between 1640 and 1642 he invented an arithmetical machine.

In 1646, while living with his family at Rouen in Normandy, Pascal became converted to Jansenism after an accident to his father, during whose convalescence various Jansenist books were brought into the household. This conversion was, however, not a definitive one to a religious life. He undertook experiments on atmospheric pressure, wrote a study on the vacuum, had controversies with the Jesuits who denied its possibility, and in 1648 he conducted, with his brother-in-law Périer, important experiments simultaneously in Paris and in Auvergne to determine atmospheric weight. After the death of Pascal's father in 1651 he had a "worldly" period until about 1654, during which time he was intimate with people like the Duc de Roannez and the Chevalier de Méré. They were not mere men of fashion, but persons of experience and literary appreciation, who undoubtedly helped to transform Pascal's views from those of a secluded student, enlarging his appreciation of the different phases of life, and giving grace and smoothness to his style. Toward the end of this period he renewed many of his scientific experiments, worked at the theory of probabilities, invented the hydraulic press and certain other practical appliances, besides writing, in all likelihood, a treatise on love. Whether he himself actually went through an emotional experience is a matter of discussion. The now discredited carriage accident at Neuilly in which Pascal came near losing his life was placed in November 1654. But, whatever the reason, Pascal underwent a new crisis, partly under the influence of his sister Jacqueline who had become a nun in the Jansenist convent of Port-Royal. This is usually called his "second conversion." He now felt the conviction of true faith, and in spite of physical suffering and mental anguish was happy in his sense of mystical insight into Christian belief. At once he stood forth as a defender of Jansenism. In 1656 he began the publication of the 'Provincial Letters,' which are the climax of religious polemic, and during the rest of his life he was planning his unfinished masterpiece, published as his 'Thoughts.' In his last years he bore with stoical firmness bodily pain increased by his ascetic mortifications, until his frail form already overburdened by his intellect gave way beneath the physical and mental strain. The transcendent name of Pascal appears in the annals of many branches of intellectual endeavor. To what has been recorded above in physics, religion and philosophy should be added his achievements ranging from the foundations of mathematical calculus to the first establishment of public omnibuses for the

transportation of passengers. But it is in religious thought that his fame rests on the most popularly appreciated foundation. His scientific training led him, even apart from emotional tendencies, to sympathize with the determinism of the Augustinian Jansenists. His scientific achievements go to show that he did not disdain, as some people assume, the power of reason, but even as a man of science, his method was synthetic rather than rationally analytic as was the method of Descartes. Pascal distinguishes in his 'Thoughts' between the *esprit de géométrie* and the *esprit de finesse*, the latter of which partakes of the spirit of synthetic feeling as intuition which often accomplishes so much that cold reason cannot reach. This tendency comes out strongly in Pascal's own religious views. He is ready to admit the help of the calculation of probabilities in coming to the conviction of God, but "the heart has its reasons (or arguments) that reason itself does not know," and these are the direct knowledge, through faith, of the truth of religion. Consequently, Pascal is impatient at those who, like his early opponent the Frère Saint-Ange, relied on rational proofs alone. To him there was something supra-rational, which gave a truer insight and conviction. Incidentally we are also helped to understand why Pascal was willing to use the arguments of the sceptic Montaigne, who, like himself, sought to destroy the pride of reason, though without Pascal's ulterior purpose. The many sidedness of Pascal's philosophical genius has caused students to give him different descriptive epithets. Some have narrowly called him a pyrrhonist or sceptic like Montaigne, because of his destructive criticism of reason. Some have seen in him pre-eminently the pessimist; others the Christian stoic and ascetic. At all events he is the religious mystic and "fideist" whose certainty was reached as much by argument as by conviction by miracles which he himself had witnessed, like the miraculous healing from disease of his own niece by the application of a thorn from the crown of thorns. Pascal has been called by some by his critics insane, but even the hard hearted cannot deny the dignity of his struggle against physical and mental suffering and the majesty of his victory. See PROVINCIAL LETTERS.

Bibliography.—The standard edition of Pascal is in the series of the 'Grands Ecrivains de la France' and is edited by Léon Brunschvicg with the help of P. Boutroux and F. Gazier (14 vols., Paris 1904-14). Important studies of Pascal are Strowski, F., 'Pascal et son temps' (3 vols., Paris 1907-09); Giraud, V., 'Pascal, l'homme, l'œuvre, l'influence' (1905); Boutroux, E., 'Pascal' (1900). Consult also *passim* Sainte Beuve's 'Port-Royal,' and in English, Viscount Saint Cyres, 'Pascal' (New York 1909).

CHARLES H. C. WRIGHT,
Professor French Language and Literature,
Harvard University.

PASCAL'S TRIANGLE, also known as **FIGURATE NUMBERS**, in *mathematics*, certain series of numbers originally studied by the Chinese and by the Greek geometers in connection with geometric figures, especially polygons and pyramids and used by Pascal to determine the co-efficients of the expansion

chronicle named from being based upon the Easter canon, containing an outline of events from Adam to 629 A.D., arranged in chronological order. It is believed to be the work of a Byzantine author who compiled it in the reign of Heraclius (610-41), using earlier records, except that the last 30 years appear to have been written from a personal knowledge of contemporary history. The work has many faults and the earlier chronicles are imperfect but it nevertheless constitutes a valuable record. The manuscript copy in existence was made in the 11th century and is in the Vatican library. It was published in Dindorf's *Corpus scriptorum historia byzantinæ* with a preface and commentary by Du Cange (1832); and in Minge's *Patrologia græca* (xcii). Consult Gelzer, 'Sextus Julius Africanus und die byzantinische Chronographie' (1885); Van der Hagen, 'Observationes in Heraclii imperatores methodum paschalem' (1736); Krumbacher, 'Geschichte der byzantinischen Litteratur' (1897).

PASCHASIUS, pās-kā'sī-ūs, **Radbertus**, or **RADBERT-PASCHASE**, French theological writer: b. Soissons, about 786; d. Saint-Riquier, 26 April 865. He entered the monastery of Corbie in 814, and subsequently became its abbot, a position he resigned about 851 in order to give his full attention to literary labors. He then retired to Saint-Riquier. He was a member of the Synod of Paris and in 849 he attended the Assembly of Chiersy in his capacity as abbot. Author of 'De Corpore et Sanguine Domini'; 'Expositio in Lamentationes Jeremiæ'; 'De Fide, Spe et Caritate'; 'De Partu Virginis' etc. A collected edition of his works was edited by Sirmond (Paris 1618).

PASCO, Samuel, American soldier and politician: b. London, England, 28 June 1834; d. 13 March 1917. His family emigrated to Prince Edward Island and finally settled in Massachusetts. He studied at Harvard University, receiving his M.A. in 1872. From 1859-61 he was principal of the Waukeenan Academy. In the Civil War he served in the Confederate Army in the 3d Florida Volunteers and was wounded and captured at Missionary Ridge in 1863. After the war he resumed his position at the Academy and in the following year moved to Monticello, Fla., where he was clerk of the Civic Court. In 1868 he was admitted to the bar and began his political career. From 1876-88 he was chairman of the Democratic State Committee; was president of the Constitutional Convention of 1885; a member of the Florida legislature in 1887 and speaker of the house of representatives. In 1880 and 1908 he was a presidential elector, and served as United States senator from 1887-89. He was also a member of the Democratic National Committee 1880-1900 and of the Isthmian Canal Committee 1897-1905. From 1910-11 he was appointed commander of the Florida division of the U.C.V. with the title of major-general, and was then made honorary commander for life.

PASCO, a city in Peru. See CERRO DE PASCO.

PASCUAL LÓPEZ is the "autobiography of a medical student of Santiago" written by the Condesa Emilia Pardo Bazán. This work which appeared in 1879 belongs to that famous Spanish family of picaresque tales whose immortal ancestor 'Lazarillo de Tormes' furnished a model

for so many European works. 'Gil Blas' is his cousin on the French side and 'Cypriano' of Calderón's 'Mágico Prodigioso' is his Spanish prototype. Pascual, however, being a modern, does not sell his soul to the devil, but to a professor of chemistry who in the popular mind is on intimate terms with the 'old 'un.' Pascual is one of the most finished rascals in literature. He is no moral prig who having mended his ways recounts in maturer years the escapades of his youth. He leaves us as unregenerate as he was when we first met him. A shiftless, stupid, ungrateful scapegrace he is, yet always winning. His elastic conscience permits him to borrow hard earned pennies with one hand and distribute easily won dollars with the other. His good angel 'Pastora' seems many a time on the point of making Pascual a useful member of society, but all his attempts at reform are extremely short-lived. His language is full of picturesque student slang and smacks of the soil of Galicia. It is in the stories of her own Galicia when she is not preoccupied with naturalistic formulas that Pardo Bazán is at her best. Here she is mainly concerned with her story which is exciting enough to satisfy the most adventuresome taste. A critical estimate of this novel may be found in the collected works of Pardo Bazán. There is an American edition annotated by W. I. Knapp, published by Ginn and Company.

SAMUEL M. WAXMAN.

PASDELOUP, pa'd'-loo, **Jules Etienne**, French musical conductor: b. Paris, 15 Sept. 1819; d. Fontainebleau, 13 Aug. 1887. He was educated at the Paris Conservatoire, where he was awarded the first prize for solfège in 1832, and for piano in 1834. He founded in 1851 an orchestra whose members were gathered from the Conservatoire students and through his production of the best new compositions did much to awaken popular appreciation of them. In 1861 he began the popular Sunday concerts which he continued for 23 years, the government granting him a yearly subsidy of 25,000 francs. He was a member of the Legion of Honor.

PASENG, a Persian name of the male of the wild goat, whence have sprung the domestic races; the female is called "boz." See GOAT.

PASHA, pāsh'ā, **BASHA**, a title of rank in Turkey; formerly an honorary title of a prince of the blood; latterly a title of the higher military and civil officials. The badge of the pasha was originally a horsetail waving from the end of a lance, which was crowned with a gold or silver ball. There are three military grades of pasha; and these are symbolized by the number of horse tails borne before the pasha on state occasions. Admirals and governors may have the title of pasha which is bestowed also upon other servants of the government, or rather of the Crown, by whom the honor is given and by whom alone it may be taken away. Originally a tail on the end of a lance was borne before the Mongolian chief as a sign of his rank and by way of a standard. Now three tails are the symbol of a general in chief; two tails, of a general; and one tail, of a brigadier.

PASHICH, **PASHITCH** or **PASITCH**, pā'shīch, **Nicola**, Serbian statesman: b. Saitchar, 1846. He studied at Belgrade and at Zurich, afterward practising as an engineer. He fought in the Turkish War in 1876-78, and

later became a leader of the Radical party. He was implicated in a plot against King Milan and was exiled in 1883-89, when he was permitted to return to Serbia. He later became mayor of Belgrade and in 1891-92 he was Prime Minister. He was Ambassador to Russia in 1893-94 and in 1899 was again convicted of plotting against King Milan, but was pardoned. He was Minister of Foreign Affairs in 1904-05 and Prime Minister in 1906-08. He was credited with piloting his country through the Austrian crisis of 1909 and was again appointed Prime Minister in 1912. He resigned in 1913 because of criticism concerning his Bulgarian policy, but was persuaded to reconsider his decision and remain at his post. His ministry was overthrown in May 1914 but the opposition had not the strength to form a ministry and he was recalled. He was in office during the Austrian crisis of 1914, terminating in the European War and remained in power during the enforced flight of the government from Belgrade to Corfu and its return to Belgrade after the signing of the armistice.

PASHKOFF, pash'kōf, **Vasili Alexandrovitch**, Russian religious reformer: d. Paris, 8 Feb. 1902. He was a member of the Russian aristocracy, a colonel of the Imperial Guard and a personal acquaintance of Alexander II. In 1874 he became interested in the preaching of Lord Radstock and finally accepted that nobleman's views of Christianity. From that time he devoted his life to evangelical work, opened his palace to all classes for religious meetings at which he preached, and founded several organizations for religious study. He required none of those who accepted his views to leave the national church, but merely to live the simple life of early Christianity according to the principles of the Gospels. He devoted almost all his fortune to helping the poor and unfortunate. After the death of Alexander II who had favored him, his preaching was condemned as "prejudicial to the state"; his public meetings were prohibited and he was finally exiled. He continued his work in England, Austria, Rome and Paris till the time of his death and the "Pashkovski Sect," which he had founded in Russia, still continued its work to a certain extent. He had a very large following in Russia. Consult *Eclectic Magazine* vol. 139, 3d series, pp. 344-350.

PASHT. See BUBASTIS.

PASIG, pā'sig, Philippines, pueblo, capital of the province of Rizal, Luzon; on the north-west shore of the Laguna de Bay at the mouth of the Marisquina River, eight miles east of Manila. It suffered considerable damage by fire and otherwise during the Filipino insurrection of 1897 and only a few of the stone houses remained standing. It is an important road centre and has a large trade. Pop. 25,000.

PASIG, the outlet of the Bay Lagoon (q.v.) into the Bay of Manila, at the city of Manila, length 10 miles. It has several important tributaries, is navigable for native boats and light craft and is the chief means of communication between Manila and the Bay Lagoon and the provinces on its shores.

PASINI, pā-zē'nē, **Alberto**, Italian painter: b. Busseto, near Parma, 1820; d. Turin, 1899. He began his career as a lithographer, but sub-

sequently became the pupil of Theodore Rousseau and other artists at Paris and formed his style as a painter of Oriental genre in the course of travels through Turkey and Persia. He has also admirably caught Spanish atmospheric effects and customs. He was eminently successful in his chosen department of art and rivals the best French artists of the Oriental school in the brilliance and truthfulness of his pictures, a good specimen of which, 'Entrance to a Mosque,' hangs in the New York Metropolitan Museum. His works differ very greatly from the tendency of the modern school of painting in that they are executed with great care and in fine and elaborate detail.

PASIPHAË, pā-sīf'ā-ē, in Greek mythology, the daughter of Helios, the sister of Circe and the wife of Minos. Minos failed to perform certain vows and Poseidon caused her to become enamored of a bull. She was the mother of the Minotaur. See DÆDALUS; MINOS AND MINOTAUR.

PASKEVITCH, pās-kyě'vich, **Ivan Fedorovitch**, COUNT OF ERIVAN, PRINCE OF WARSAW, Russian field-marshal: b. Pultova, Russia, 19 May 1782; d. Warsaw, Russia, 1 Feb. 1856. He was a page at the court of Emperor Paul and in 1800 entered the army, where he rapidly won distinction and under Yermoloff in 1826 he waged such successful war against the Persians that he succeeded to the command in the following year. He conquered the fortified Armenian towns of Etchmiadzin, Nakhitchevan and Erivan and in 1828 concluded the peace of Turkman-tchai. In 1828-29 he made two successful campaigns against the Asiatic Turks and took Kars, Erzerum and other strong places. He was made Count of Erivan and a field-marshal in 1830 and in that year crushed an uprising in Poland, where he was in command. In 1831 he succeeded to the chief command of the armies in Poland and though his rule was severe there was no uprising even in the troubles of 1848-49, when Paskevitch stopped the intervention of Hungary in behalf of the Poles by marching 200,000 men into Hungary itself. He succeeded to the command of the Russian army in 1854, but resigned after meeting reverses at Silistria. Consult Tolstoy, 'Essai biographique et historique sur le Field-maréchal Prince de Vasovie (Paris 1885).

PASLEY, pā'slē, **SIR William Charles**, British general and military engineer: b. Eskdale Muir, Dumfriesshire, 8 Sept. 1780; d. London, 19 April 1861. He was educated at the Royal Military Academy at Woolwich and in 1797 was commissioned second-lieutenant in the Royal Artillery. He was transferred to the Royal Engineers in 1798 and served in Minorca, Malta, Naples and Sicily, reaching the rank of captain in 1805. He later served in the defense of Gaeta against the French and in Spain and Holland. He was in command of the Plymouth Company of Royal Military Artificers in 1811-12, and in 1812-41, he was director of the Royal Engineer establishment at Chatham. He was knighted in 1846 and became general in 1860. He was connected at various times with military schools, in the improvement of which he was deeply interested; and as a writer on military engineering he performed notable service to his profession. Author of 'Essay on the Military Policy and Institutions of the British Empire'

(1810); 'Military Instruction' (3 vols., 1814-17); 'Practical Operations of a Siege' (2 vols., 1829-32); 'Limes, Cements, Concrete, etc.' (1838), etc.

PASPALUM, a genus of grasses; the carpetgrasses. See GRASSES OF THE UNITED STATES.

PASQUE FLOWER, a hardy perennial herb (*Pulsatilla pulsatilla*) of the family *Ranunculaceæ*. It is a native of Europe in stony places and well drained soils, and has been introduced into gardens in cool climates as an ornamental plant. It is very hairy, bears tripinately divided leaves upon slender stalks and blue or reddish-purple blossoms which are often more than two inches in diameter. Its name, "pasque," is the old French for Easter, about which time it blossoms, a habit which has made the plant a favorite in old-fashioned gardens. Its petals are often used to color Easter eggs. Several other species of the genus have been called by this name, notably the American pasque flower (*P. patens*), common in low ground in the northern central United States.

PASQUIN, päs'kwîn, **PASQUINO**, or **PASQUINADE**, a lampoon or short satirical publication, deriving its name from Pasquino, a tailor who lived in Rome in the 15th century. He was celebrated for his wit and satire. After his death a mutilated or broken statue was resurrected and placed near his shop, and on this were posted all satires, rhymes, libels, etc., hence the name pasquin or pasquinade. The Roman populace made use of these satires to express themselves in a manner that was prohibited by laws against the freedom of speech.

PASS CHRISTIAN, Miss., town in Harrison County, on Mississippi Sound, and on the Louisville and Nashville Railroad, 75 miles southwest of Mobile, Ala. It is one of the largest and most popular winter resorts on the Gulf of Mexico, the winter temperature averaging 60° F. It has a water front of over six miles, along which extends a shell-paved avenue, lined with magnolias and live oaks. There are also numerous promenading and fishing piers, and facilities for boating and bathing. It is in an agricultural and livestock raising region, and has a packing establishment and a large oyster business. Pop. about 2,500.

PASSAGLIA, päs-sä'yä, **Carlo**, Italian theologian: b. Lucca, 2 May 1812; d. Turin, 12 March 1887. He was educated at Rome, becoming a Jesuit at 15; in 1844 became professor at the Collegium Romanum. Four years afterward he was exiled from Italy by the expulsion of the Jesuits, but returned to Rome in 1849 and founded the 'Civiltà Cattolica.' In 1853 he published a three-volume defense of the dogma of the Immaculate Conception, in which he was a firm believer. But in spite of his orthodoxy his allegiance to the Pope faltered on the question of temporal power; in 1858 he left the Jesuit Order, aroused by the ideal of Italian nationalism, and attacked the position of the Pope in his famous letter, 'Pro Causa Italica ad Episcopos Catholicos,' which was put on the 'Index.' Passaglia left Rome and in 1861 became professor of moral philosophy in the University of Turin. His organ (1862-66), *Il Mediatore*, renewed the attack on the temporal power of the Pope. He was a member of the first Italian Parliament, in which he

attempted to form a liberal Catholic party. Consult Biginelli, 'Life of Passaglia.'

PASSAIC, N. J., city, in Passaic County, on the Passaic River, and on the New York, Susquehanna and Western, the Erie and the Delaware, Lackawanna and Western railroads, about 10 miles northwest of New York City. It was settled in 1692, and until 1852 was called Aquackanonk Landing. It was incorporated as a village in 1869 and in 1873 was chartered as a city. It is near the scene of several of the engagements of the Revolutionary War; Washington crossed the Passaic River at Aquackanonk Landing in 1776 when he was retreating through New Jersey. Passaic is both a manufacturing and a residential city. The good water power which was available had a great influence in attracting industries to the city, and the water is such as to be of great value in the bleaching and dyeing industry. Eighteen thousand persons are employed in the various industries, which have a capital of \$48,000,000 and whose products are valued at \$53,000,000 per year. The largest industry in the city is the manufacture of woolen and worsted, closely followed by cotton and linen. Passaic manufactures more textiles than any other city in New Jersey, and one-third of the handkerchiefs made in the United States. Other large industrial establishments are rubber works, silk mills, bleacheries and dye works, chemical works, belting and packing plants, leather and metal works. Twelve grade schools and one high school, recently erected at a cost of over \$300,000, comprise the public school system. There are also five parochial schools and one private school. There are six parks in the park system, and all are being rapidly developed. Public playgrounds are maintained in the various parts of the city. The commission form of government has been in force since 1911. The assessed valuation in 1918 was over \$50,000,000. Pop. (1920) 63,824.

PASSAIC, a river of New Jersey, which rises near Morristown, in Morris County, flows first south, then east on the line between Morris and Somerset counties, then northeast between Morris and Essex counties, crosses a corner of Passaic County and flows south into Newark Bay. It is about 100 miles long and navigable for small vessels as far as Passaic (about 11 miles). At Paterson there is a fall of 72 feet, about 50 feet of perpendicular descent. The extensive water power has been utilized for manufacturing, and by means of dams and canals has been distributed to many manufactories.

PASSAMAQUODDY (päs-a-mä-kwöd'y) **BAY**, an inlet of the Bay of Fundy, forming a part of the boundary between Maine and New Brunswick, 12 miles long and eight miles wide at the entrance. It receives the waters of the Saint Croix River. It is deep, sheltered by several islands lying at the entrance and affords excellent harbors. The fisheries also are important. The rise of the tide averages 25 feet. Eastport, Maine, is on one of the islands at the mouth.

PASSAMAQUODDY INDIANS, an American tribe of the Algonquin family, residing in the vicinity of Passamaquoddy Bay and the Saint Croix River in Maine and in

New Brunswick. During the period of the colonial wars the tribe fought with the French. The word Passamaquoddy is said to mean the "place where there are plenty of pollock." The people of this tribe who, in historical times at least, were never very numerous, belonged to the Abnaki confederacy and were linguistically very closely related to the Malecite. The Penobscot and Passamaquoddy tribes have in the Maine legislature a representative who is allowed to speak only on matters concerning the interests of the Indians of these two tribes, and especially of the reservations. There are from 400 to 500 Passamaquoddy Indians in the United States and a somewhat smaller number in Canada.

PASSAROWITZ, päs-sä'rō-vīts, or **POSSCHAREWATZ**, pō-shä'rē-väts, Serbia, a town, near the Morava, 10 miles south of the junction of the Morava and the Danube, at the foot of Sopot Mountain, and about 35 miles southeast of Belgrade. Pop. about 14,000. It is capital of an administrative department of the same name, with an area of more than 1,600 square miles and a population of 231,029. The city was the scene of negotiations for a peace between Turkey on one side and Austria and Venice on the other, 21 July 1718, by which Austria got Temesvar, Belgrade and part of Serbia, Venice's rights in Herzegovina, Albania and Dalmatia were recognized, and the Morea was restored to Turkey. Passarowitz was captured by the Germans in 1915.

PASSAU, päs'sow, Germany, a town of Lower Bavaria, in a mountain defile at the confluence of the Ilz, Inn and Danube, 91 miles by rail east-northeast of Munich. It stands on the southeast frontier of the republic and consists of four parts—Passau proper, on the tongue of land between the right bank of the Danube and the left bank of the Inn; Innstadt, on the right bank of the Inn; Anger, a suburb on the left bank of the Danube, adjoining it Oberhaus, a fort strongly situated on a height 417 feet above the river; and Ilzstadt, also on the left bank of the Danube, but likewise traversed by the Ilz. Intercommunication is provided by numerous bridges. The principal buildings are the cathedral, a handsome modern structure in the Italian style, with a bell-shaped cupola; the bishop's palace; church of Saint Michael; the Jesuit College, now converted into a lyceum; the town-house, gymnasium and library, the school of agriculture and the Training School for Teachers. The manufactures consist of iron, copper and earthenware, porcelain, crucibles. There are also several extensive breweries. Passau is an old town and is famous for the treaty signed in 1552, when Charles V., intimidated by the victories of Maurice of Saxony, was compelled to recognize the Protestants and to grant them religious toleration. Pop. about 22,000.

PASSAVANT, pä-sä-vän, William Alfred, American Lutheran clergyman: b. Zelenople, Pa., 9 Oct. 1821; d. 3 June 1894. He was graduated from Jefferson College in 1840, from the Lutheran Theological Seminary, Gettysburg, in 1842, was ordained in the same year and accepted a pastorate in Baltimore, Md. He was in charge of a parish in Pittsburgh 1844-55, after which he devoted himself entirely to editorial and philanthropic work. He founded

numerous hospitals and orphanages in different cities and, co-operating with A. Louis Thiel, founded in 1870 Thiel College at Greenville, Pa. He labored assiduously to secure funds for these institutions, collecting, it is estimated, over \$1,000,000 for them. The Order of Deaconesses was introduced by him into the United States. He edited the *Missionary* at Pittsburgh (1845-61) till it was merged with the *Lutheran*, of which he was coeditor, and in 1880 he founded the *Workman* at Pittsburgh, of which he was editor until his death. Consult Gerberding, G. H., 'Life and Letters of W. A. Passavant' (Greenville, Pa., 1906).

PASSÉ (pä-sä) INDIANS, a South American tribe of the Arawakan family, formerly very numerous in northwestern Brazil, but now as a tribal organization nearly extinct through absorption into other tribes and crossing with the whites. The race is noted for handsome figures, fine features and bright complexions, nearly approaching the Caucasian type. They have a powerful native priesthood and bury their dead in circular graves. They have always been friendly to the whites and are a peaceful, industrious race. Many of them lived in the mission villages in the 18th century.

PASSENGER PIGEON, the American wild pigeon (*Ectopistes migratorius*), so named from its former conspicuous habit of passing from one part of the country to another in immense flocks. These movements were not migratory in the proper sense of the term, however, except in the northern parts of the birds' range, but were movements *en masse* in search of food. These birds were resident throughout the year south of Canada and the most northern States, which they were compelled to leave in midwinter when the ground was covered with snow. Early travelers and observers astonish us by their accounts of the immense numbers of these pigeons which used to move about the forested interior of the country previous to its general settlement, statements confirmed by records and recollections of men still living. Audubon once computed that the continuous stream of pigeons he saw on one of many occasions included more than 1,100,000,000 birds, and would consume more than 8½ million bushels of grain daily.

These enormous numbers do not appear to be at all exaggerated from the actual details of the case. Wilson similarly calculated that a flock observed by him was 240 miles long, and numbered 2,230,272,000 pigeons, while the food-supply was estimated at 17,424,000 bushels of grain a day.

In fact, however, grain became the food of pigeons only after fields of rice, wheat, oats, etc., began to be planted, and never formed an extensive part of the feed, since the birds did not settle upon and attack the growing or ripening fields, but only gleaned among the stubble. Their food consisted mainly of the smaller acorns and thin-shelled nuts, especially beech-nuts, and a variety of berries and small fruits; and where such material was plentiful they gathered in vast congregations, which thronged upon the trees, until branches would break with their weight, and covered the ground so thickly, turning over the leaves in search of something to eat, that the moment one rose upon the wing another was ready to take its

place. The pigeons would remain at such "roosts" as long as the food-supply held out, and in May or early June would make their nests in company, sometimes so loading the trees that they would break down. The nests were rude platforms of twigs, holding two roseate white eggs, or sometimes only one.

Such congregations were more often seen in the Great Lakes region than elsewhere, and there, in the first two-thirds of the 19th century, settlers would gather and kill or catch the birds in great quantities, while the wild carnivorous animals from far and near would assemble to the feast. At first the killing was done only for home needs, each family perhaps salting a few barrels of the bodies; but later, when transportation facilities improved, large numbers were taken and packed for sale elsewhere; and other large numbers were captured alive especially of the young, by being tolled into pens by spreading food, and then transferred to other enclosures, where they were kept and fattened for market. Men made a business of this, going from place to place wherever pigeons abounded, and sometimes capturing 200 dozen or more in a day. Audubon records that in 1805 he saw schooners at the wharves in New York city loaded in bulk with pigeons caught up the Hudson River and sold for one cent each. In addition to this market use, a very large demand arose among so-called sportsmen for pigeons to be shot at when released alive from spring-traps merely as an amusement and test of marksmanship. As many as 20,000 were used on a single occasion in some "tournaments" before this reprehensible form of recreation could be prohibited by enlightened public sentiment crystallized into law. This incessant slaughter and persecution, together with the clearing away of large acres of forest, rapidly destroyed the pigeons, the disappearance of which was greatly hastened by a series of very cold winters and late, stormy springs between 1860 and 1870. Under the protection of the game laws the bird seems gradually becoming more numerous in its old haunts, and may revive in considerable numbers, since food remains abundant for it, and natural enemies are diminished.

The passenger pigeon has a total length in the male of 17 inches, one-half of which belongs to the narrow, gracefully pointed tail. The female is much smaller. The upper parts generally are a variable blue, the neck richly glossed with metallic golden violet, and the lower purplish or brownish red, fading behind into a violet tint, nearly white beneath the tail. The wing-quills are blackish, with a bluish border, and the wing-coverts obscurely spotted. The middle ones of the 12 tail-feathers are brown, the others pale blue on the outer web and white on the inner web. The wings are long (eight and one-half inches) and pointed, and the flight of the bird remarkably swift and powerful, rivals that of the homing pigeon, which in general this bird resembles as a type of the *Columbidæ*.

This species was never known west of the eastern border of the plains, but originally occurred through all eastern North America as far north in summer as Hudson Bay.

Consult Wilson, Audubon, Godman, Nuttall, DeKay, Richardson and early American writers generally; and Baird, Brewer and Ridg-

way, 'Birds of North America' (1874) and Mereson, W. B., 'The Passenger Pigeon' (New York 1907); Stewart Baker, 'Indian Pigeons and Doves' (London 1913). See PIGEON.

PASSENGERS. See COMMON CARRIER.

PASSERES, or PASSERIFORMES, a group of birds comprising over half of all classified birds. In its subdivisions of families, genera, species and subspecies, it embraces the greater number of the small, familiar and predominantly migratory or passing birds, more or less related to the ordinary house sparrow. See ORNITHOLOGY.

PASSI, pās'sē, or PASSY, Philippines, town, province of Iloilo, island of Panay, at the junction of the Malinao and Jalaur rivers; 25 miles north of Iloilo, the provincial capital. Pop. about 15,000.

PASSING-BELL, the bell sometimes rung to call for the people's prayers for the dying in their hour of agony. The usage of tolling a bell while the soul is said to be "passing" from earth is at least as old in England as the days of the Venerable Bede (673-735), who tells us that at the death of Saint Hilda, one of the nuns of a distant convent, as she was sleeping thought she heard the sound of the passing-bell calling her and her companions to prayer.

PASSINI, pā-sē'nē, Ludwig, Austrian painter: b. Vienna, 9 July 1832; d. 1903. He was the son of the copper-plate engraver, Johann Passini, and under his father's direction pursued his art studies at the Vienna Academy. In 1850 he went with his parents to Trieste and later to Venice, where he devoted himself to painting in water-colors. In 1855 he took up his residence in Rome and began his series of architectural pictures, and interiors with figures. From 1873 he lived at Venice, and the brilliant aquarelles which he there executed reveal a remarkable talent for delineating racial types and a profound sympathy with the life and spirit of the common people. His masterly technique has commanded the admiration of critics and been the model and inspiration of younger artists. He discovered artistic beauties in Venice, which other artists had passed by unnoticed, and he was largely instrumental in making them known. He was also a good portrait painter. Among his principal works are 'The Choir of Saint Peter's Church' (Berlin National Gallery); 'The Catechism'; 'The Girls' School'; 'Vespers in Saint Paul's at Rome.' He has also painted some clever portraits in water-color, notably that of the Empress of Austria. He is undoubtedly the first water-color painter of his country. 'The Tasso Reader'; 'Pumpkin Vender' (Vienna Museum); 'Curious People on a Bridge' (Breslau Museum); 'Mass at Chioggia' (Metropolitan Museum, New York).

PASSION, suffering, applied especially to the sufferings of Jesus, which are solemnly commemorated by Christian churches every year. Good Friday is the anniversary of the crucifixion, as Easter Day is of Christ's resurrection, these days being led up to by the whole season of Lent (q.v.), the seven and a half weeks preceding Easter (q.v.).

PASSION CROSS, a form of the Latin cross having a long stem and short traverse near the top, supposed to present the proportions of

the cross upon which Christ suffered. It is used in Christian churches, and in the Roman Catholic Church often bears a representation of the figure of Christ. A passion cross elevated three steps, or degrees, is called a cross of Calvary; the three steps being explained by heralds as signifying hope, faith and charity.

PASSION FLOWER, a plant of the genus *Passiflora*, of the family *Passifloraceæ*. The species, of which about 100 have been described, are mostly natives of tropical and subtropical America, a few extending as far north as Pennsylvania, and a few natives of the Australasian Archipelago. The great majority are vines, but some are herbs, shrubs and trees. They are characterized by variously lobed, simple, alternate leaves with axillary tendrils; and perfect flowers of remarkable shape and often of high coloring, though green and yellow are the prevailing tints. The early Spanish settlers in America are responsible for the popular name of these plants. They fancied the flower to typify the passion of Jesus; the 10 colored parts of the floral envelope being supposed to represent the apostles, with the exception of Peter and Judas Iscariot; the showy corona of filaments suggesting the crown of thorns, or, to some, the halo; the five stamens typifying the wounds in Jesus' hands, feet and side; the three styles representing the nails, and the column from which the stamens and pistil arise, the pillar used in the scourging. Other parts of the plant were similarly treated, for example, the pointed leaves symbolized the spear-head, and the tendrils, the cords. (Consult Folkard, 'Plant Lore, Legends and Lyrics').

A large number of the species are cultivated in greenhouses. They are graceful in foliage, and their large, often showy flowers, borne singly in the axils of the leaves or in axillary racemes, are valued as curiosities. They vary in their ease of propagation and cultivation, some being easy to raise from seed, some from cuttings, etc. Several are hardy out of doors as far north as Washington, D. C., others tender even in the Gulf States.

Among the best known are *P. incarnata*, popularly called Maypop, and *P. lutea*. The former is a well-known weed from Pennsylvania southward and westward; the latter from Pennsylvania southward. Both are cultivated for ornament in gardens and greenhouses. The fruit of maypops is edible. *P. quadrangularis* is a tropical American species commonly called granadilla. Its fruits are highly prized in the West Indies and southern Florida. Several other species bear edible fruits; for example, *P. edulis*, sometimes erroneously called granadilla; *P. laurifolia*, the water lemon or Jamaica honeysuckle; and *P. alata*; all South American species.

PASSION MUSIC, the musical rendering of certain portions of the Catholic Church's liturgy in the week preceding Easter, now called, but improperly, by non-Catholics, Passion Week, its proper name being both in the Latin and the Eastern church Holy Week—*Hebdomas* (or *Septimana*) *sancta, major*, etc., and ἑβδομας ἁγία, μεγάλη, etc. In the calendar of the Latin Church, Passion week is the week which begins with Passion Sunday (*Dominica Passionis*), the fifth Sunday of Lent; the sixth Sunday is Palm Sunday (*Dominica in Palmis*,

ἐορτή τῶν βασιλῶν) in the Latin and Greek churches. On that day the history of our Lord's Passion, as recounted in the Gospel of Matthew, is chanted alternately by three clerks in holy orders, one rendering the narrative portion (*evangelista*), another the words spoken by Jesus (*Christus*), the third those spoken by the apostles, the high priests, etc. In the afternoon or evening of the Wednesday, Thursday and Friday of Holy Week the office of Matins and Lauds is chanted, the most striking feature of the musical service being the rendering, on Holy Thursday and Good Friday, of the Lamentations of the Prophet Jeremiah in most appropriate plain-chant melodies; this service is called *Tenebræ* because by gradual extinguishment of all the lights the interior of the church is left in darkness. In the morning service of Holy Thursday (Maundy Thursday) is chanted the hymn of triumph,

Pange, lingua, gloriosi corporis mysterium,
Sanguisque pretiosi quem in mundi pretium
Fructus ventris generosi Rex effudit gentium.

On Good Friday, in the morning service, the history of the Passion according to Saint John is chanted. Deeply impressive, in the service of this day, is the dramatic rendering of the *Improperia* or "reproaches" of Jesus to the Jewish people, while the clergy and people are doing reverence to the representation of the Crucified: "*Popule meus, quid feci tibi? aut in quo contristavi te.*" etc.—"My people, what have I done to thee, or wherein have I vexed thee?" and this strophe of one chanter is taken up by a second with: "*Quia eduxi te de terra Ægypti parasti crucem salvatori tuo.*" After each *improperium* one choir chants, in the Greek language, "Holy God," to which a second choir responds "Holy God" in Latin; then alternately in Greek and Latin the two choirs chant "Holy Strong," "Holy Immortal, have mercy on us." In the morning service of Holy Saturday the grand prose composition, *Exultet*, is sung to the finest melody in the whole repertoire of church music.

PASSION-PLAY, a species of mystery-play which was exceedingly popular in the Middle Ages. It was acted in Holy Week. Such plays were frequent in Provence, northern France and Italy, Spain, Portugal and England. After the Reformation they were repressed in Germany excepting in those regions where the population still remained faithful to the Roman Catholic Church, that is, in Bavaria, the Tyrol and the Salzburg Alps. In the 18th century Carl Theodore and King Maximilian Joseph I forbade the performance of such mysteries in Bavaria, making an exception in the case of the villagers of Oberammergau, where the play had been enacted since 1633. These villagers had escaped contagion from the plague that was raging in their neighborhood, and made a vow to perform such a play every 10 years. This they have done and their representation of the drama has drawn thousands of visitors from all parts of the world. There are about 600 performers and the character of Christ is taken by a man remarkable for his religiousness and sanctity of life. The passion-play was introduced into Spanish America by the Spaniards; and still rude passion plays may be seen in several Latin-American countries to-day. Even at the beginning of the 20th century an Indian version of

the passion-play was a feature of the life of several Mexican towns. In such plays all the actors were Indians. Consult Grein, 'Das Oberammergauer Passionspiel' (1880); Stead, 'The Passion Play' (1890).

PASSION WEEK, the week before Holy Week, which latter is the last week in Lent, and was styled by the primitive Christians the "Great Week."

PASSIONATE PILGRIM, The, a collection of 20 sonnets published in 1599 by W. Jaggard and attributed to Shakespeare. Of the total number only five, however, are clearly proved to be Shakespeare's, others being by Barnfield, Marlowe and Raleigh. The authorship was for a time undisputed but in later editions Shakespeare's name was withdrawn from the title page.

PASSIONISTS, a very ancient order of monks under the jurisdiction of the Roman Catholic Church. See **ORDERS, RELIGIOUS**.

PASSOVER (Hebrew *pesach*, Aramaic *Pascha*, a sparing), the Jewish feast to commemorate the sparing of the Israelite first-born and the escape out of Egypt. It falls on the first full moon of the spring, from the 14th to the 21st of the month Nisan. (See **EASTER**). At this festival the Israelites, while they remained in possession of Palestine, assembled in the tabernacle, and from Solomon's time in the temple. During the eight days of the feast they were commanded to eat only unleavened bread, because their hasty departure from Egypt obliged them to take their dough with them unleavened; hence the name of "Feast of Unleavened Bread." Every family ate, on the evening of the first day, a lamb roasted whole and served up without breaking a single bone. Offerings of firstlings of the flocks and herds, and first-fruits, were presented in the temple. The Passover was and indeed with the orthodox Jews still is the principal Jewish annual festival. The Seder is the great Jewish family reunion of the year. Wherever the traveler may be the rest of the year, his mind rests not in the spring until he is safely home again, so he may take part in the Seder around the family table.

The master of the house occupies the seat of honor at the head of the table. He is clothed in his best, over which he wears his white linen death shroud—the Kittel. A skull-cap of silk or velvet covers his patriarchal head, and he rests his arms on soft pillows enclosed in shams of immaculate whiteness. At his right sits his wife—at his left his eldest son; guests, sons, daughters and servants, if there be any, occupy the remaining seats at the table, and symbolize the equality of all, before man and God, and commemorate the one time slavery of all Israel. On the table directly in front of pater-familias is a plate on which three flat cakes—known as matzoth, are placed, each covered with a spotless white cloth or napkin. Close at hand is a dish which contains a portion of the shoulder or the shank of a lamb, with a small bit of meat attached, roasted on the coals almost to the point of charring. In this dish one may also observe an egg, peeled of its shell, that has been roasted hard in hot ash. A third dish contains a goodly portion of horseradish or other bitter herb, and a fourth holds the Charoseth—a cement-like

paste made of nuts, apples, raisins and spices of various kinds.

Each of these dishes has its peculiar significance. The number (three) of the cakes signifies the three national divisions: Priests, Levites and Israelites. The matzoth represent the unleavened dough which the Israelites carried with them on their flight out of bondage; the shank-bone or shoulder blade represent the paschal lamb—which was by far the most important feature of the Passover in the days of the temple; the bitter herbs stand as a reminder of the bitter days of slavery in the kingdom of the Pharaohs.

These preliminaries having been properly set in place, the ceremony proper begins. The hands are washed and various blessings are recited appropriate to the occasion. The master of the house, breaking one of the three matzoth in two, and pointing to the roasted bone and egg, lying before him, recites in Chaldaic, "Lo! this is the bread of affliction, which our forefathers ate in the land of Egypt; let all those who are hungry enter and eat thereof; and all who are in need, come, and celebrate the Passover."

The youngest male member of the family then asks the classic "four questions," the head of the house and all those about the table reply, in Hebrew or in English: "Because we were slaves unto Pharaoh in Egypt, and the Eternal, our God, brought us forth from thence with a mighty hand and an outstretched arm; and if the Most Holy had not brought forth our ancestors from Egypt; we, and our children, and our children's children, would still continue to be slaves to the Pharaohs in Egypt."

As the story of the Exodus rolls on, each of the various dishes is taken in turn, and its significance explained in picturesque language. A portion of the Hallel is next recited, and the reply closes with a benediction, in which is expressed the hope that the Holy Temple will be rebuilt and the ancient rites and sacrifices restored. The hands are again washed, and after pronouncing grace over the matzoth, the meal proper is served.

The first celebration of the Passover was on the eve of the departure of the Israelites from Egypt. A second celebration in the second year afterward is recorded in the ninth chapter of the book of Numbers. Further celebration was enjoined until the wanderers had reached the land of Canaan—which was 39 years later.

In the days of the Second Temple this festival was observed in a most elaborate manner. In the year 65 A.D., we are told, 3,000,000 Jews visited Jerusalem for the celebration of the Passover, and in the days of Nero at the Passover celebration 265,500 lambs were slain, also indicating an attendance of nearly 3,000,000 Jews. The city could not accommodate all that came from far and near. Tents were accordingly thrown up outside of the city walls. The Roman authorities, fearing the spread of sedition during these days, took extraordinary police precautions to prevent political disturbances.

The Passover celebration of to-day differs, of course, from that of 2,000 years ago; yet it differs only in so far as the changed civil and economic conditions have had their effect on Jewish life. The sacrifices are not made and the journey to Jerusalem is not undertaken, for

the Temple has been destroyed these many centuries. Nevertheless, apart from these features, the celebration of the Passover by the orthodox does not differ materially from the Passover as it was celebrated by Jesus and his disciples and the Jews before his day.

PASSOW, päs'sō, Franz Ludwig Karl Friedrich, German philologist: b. Ludwigslust, Mecklenburg, 20 Sept. 1786; d. Breslau, 11 March 1833. He was educated at Gotha and Leipzig, in 1807 was Greek professor at Weimar, and in 1815 became professor of ancient literature at Breslau; in 1829 director also of the museum of art there. His 'Greek-German Lexicon' (1819-24) formed the basis of Liddell and Scott's 'Greek Lexicon.' Other works of his are 'Turnziel' (1818); 'Elements of the History of Greek and Roman Literature and Art' (1816). Consult Sandy, J. E., 'A History of Classical Scholarship' (Vol. III, Cambridge 1908); Wachler, 'Passows Leben und Briefe' (1839).

PASSPORT, a warrant of protection and permission to travel granted by a competent authority to persons moving from place to place. In some European states no person is allowed to leave the country without a passport from his government giving him liberty to do so; and passports may be even required by the natives when they travel from one part of the country to another. In the United States the only species known are foreign passports. The regulations put in force regarding passports by different countries have naturally differed greatly at different times, as during a time of war or internal disturbance compared with a time of peace; and while persons coming from one country may have to provide themselves with passports, citizens of another country may be freely admitted. It is of advantages to be provided with a passport even in countries where it is not demanded, as it furnishes a proof of the bearer's identity and nationality. In the United States passports, with description and portraits supplied by the applicant, are issued by the State Department at Washington. They are good for two years from date, renewable by stating the date and number of the old one. The fee required is one dollar. They are issued only to citizens, native-born and naturalized and the application must be supported by an affidavit of at least one credible witness who has known the applicant at least two years, stating that the applicant is the person he represents himself to be and that the facts stated in the application are true to the best of the witness's knowledge and belief. When the applicant is accompanied by his wife, minor children and maid servant, who is a citizen of the United States, it will be sufficient to state the fact, giving their names in full, the dates and places of their birth and the allegiance of the servant, when one passport will suffice for all. In such case, however, three photographs of each person should accompany the passport application. For a man servant or any other male in the party a separate passport will be required. For a woman, if she is unmarried, in addition to the ordinary statements, she should state that she has never been married. If she is the wife or widow of a native citizen of the United States, the fact should be made to appear in her application which should be made

according to the form prescribed for a native citizen, whether she was born in this country or abroad. A married woman's citizenship follows that of her husband. It is essential, therefore, that a woman's marital relation be indicated in her application for a passport, and that in the case of a married woman her husband's citizenship be established. A woman's passport may include her minor children and maid. Application forms are furnished by the State Department free of charge.

PASSY, Frédéric, French political economist and statesman: b. Paris, 20 May 1822; d. 12 June 1912. He was educated for the law but practised but a short time before accepting an appointment as auditor to the Council of State in 1846. He withdrew from politics after the coup d'état of Napoleon III. He was one of the founders of the International and Permanent League of Peace in 1868 and became its permanent secretary. He served in the Chamber of Deputies in 1881-89; and in 1881-1902 he was professor of political economy in several colleges. He was associated with Sir. W. R. Cremer in forming the Interparliamentary Union for Arbitration and Peace; and was a member of the International Bureau of Peace at Bern, Switzerland. He was elected to the Academy of Moral and Political Sciences of the French Institute in 1877; was a commander of the Legion of Honor; and in 1901, he, with Henri Dunant, received the first Nobel Peace Prize. He was president of the Society of Political Economy for 70 years. Author of 'Mélanges économiques' (1858); 'De l'Enseignement obligatoire' (1859); 'La Guerre et la Paix' (1867); 'L'Histoire et les sciences morales et politiques' (1879); 'Historique du mouvement de la paix' (1905), etc.

PASSY, pä-sē, France, a western suburb of Paris, since 1860 incorporated with the city. See PARIS.

PAST AND PRESENT, a work by Thomas Carlyle, published in England in April 1843 and in May in the United States. It was written in seven weeks, as a respite from the harassing labor of writing 'Cromwell.' In 1842, the Camden Society had published the 'Chronicles of the Abbey of Saint Edmund's Bury,' written by Joceline de Brakelonde, at the close of the 12th century. This account of a mediæval monastery had taken Carlyle's fancy; and in 'Past and Present' he contrasts the England of his own day with the England of Joceline de Brakelonde.

PASTA, Giuditta, joo-dēt'tā päs'tā, Italian opera singer: b. Saronno, near Milan, 9 April 1798; d. Lake Como, 1 April 1865. Her maiden name was Negri, her ancestry was Jewish and her first attempts on the stage after her leaving the Conservatory of Milan met with little success. She married a tenor named Pasta in 1816, studied for a time with Scappa and made her first successes in Venice, Rome and Milan in 1819-20. At Paris she introduced the arpeggio embellishments to Rossini's music, which added much to her artistic fame. She made her first appearance in London in 1824, playing alternately there and in Paris. For 10 years her voice steadily improved and even when it began to grow weak her dramatic ability was still crescent. As late as 1850 she sang

in England and her voice was said to retain much beauty when she was 60; but as has been suggested, her fame is due principally to her remarkable combination of fine singing and classic acting. Bellini wrote 'Sonnambula' (1831) and 'Norma' especially for her; the same is true of Donizetti's 'Anna Bolena.' Among her other favorite roles were Romeo in Bellini's 'Romeo e Giulietta,' Desdemona in Rossini's 'Otello' and Nina in Paisiello's opera of that name.

PASTEL, *in art*, a colored pencil of pipe-clay, gum water and the required pigment. The executed work is also called a pastel or a drawing in chalk. See CRAYON; PAINTING, TECHNICAL.

PASTER, that part of the leg of a horse between the "fet-lock" joint next the foot and the coronet of the hoof. The first phalanx of the foot is called the great pastern bone; the second, the small pastern or coronary; the third, the coffin-bone, which is enclosed in the foot.

PASTEUR, pās-tēr, Louis, French chemist: b. Dôle (Jura), 27 Dec. 1822; d. Villeneuve l'Etang (Seine-et-Oise), 28 Sept 1895. He was educated at the Royal College of Besançon and the Ecole Normale of Paris from which he was graduated in 1847. The following year he became professor in the Lycée at Dijon, in 1849 professor of chemistry at Strassburg and in 1854 dean at Lille of the scientific faculty, which he organized. In 1857 he was made director of scientific studies in the Ecole Normale, in 1868 director of the chemico-physiological laboratory at the Ecole des Hautes Etudes and in 1887 permanent secretary of the Academy of Sciences. In 1889 he withdrew from all other posts to give his entire attention to the management of the Pasteur Institute, built by popular subscription for the prosecution of research in the preventive treatment of infection. His first investigations, which aroused the wonder of the veteran chemist Biot and placed him high among the scientists of the time, had to do with optically active and inactive substances. His examination of two tartaric acids, one of which turned to the right the plane of a ray of polarized light while the second remained inoperative, proved that the inactivity of the latter was due to its being composed of two isomeric acids which diverted the ray with equal power in opposite directions. In his subsequent work, Pasteur applied these exacting methods of research, chemical and physical, to the solution of several complex phenomena. Fermentation had not then been explained. Pasteur showed that the various changes involved in the process were the result of the presence and growth of a micro-organism which he called the ferment. He was thus the founder of the science of bacteriology (q.v.), as he had previously been of stereochemistry (q.v.). He proceeded to demonstrate that the varieties of fermentation were due each to a special organism, and that when these atmospheric germs were absolutely excluded no change took place. These discoveries proved of great service to the industries of brewing and winemaking, in which they substituted scientific certainty for guesswork. To prevent the deterioration of wines and beers, as also of milk, a process of heating, known as "Pasteurization," was introduced and a large financial loss was avoided. In 1865 Pasteur began the

study of the silkworm disease, which had so impaired the value of raw silk as seriously to threaten the industry in France. He made investigations in the plantations of southern France and was finally able to announce the results of his experiments and the means to be taken for the extermination of the plague. The history of this investigation is of great interest. It was followed by a rapid increase in the annual value of silk and the re-establishment of prosperity in the trade. Pasteur's work in preventive medicine is probably his best-known achievement. The discovery of Edward Jenner (q.v.) had never been utilized. Pasteur generalized it by determining that as each variety of fermentation is originated by a specific ferment, so in the case of various maladies the infection depended on the presence of a specific microbe. He found that "cultures," or artificial growths, of this microbe might be obtained and that by a certain succession of such cultures the virus of the microbe became so weakened, or "attenuated," that by treatment with them animals, though a slight attack of the given malady appeared, were rendered immune. The application of this result to cholera in fowls and anthrax in cattle and sheep was very important. Pasteur finally extended it to inoculation for rabies with beneficial effect. His discovery of the anti-toxin followed (1885) long experimentation and was highly successful. For a description of it see HYDROPHOBIA. The Pasteur Institute was soon established and similar ones arose elsewhere. Pasteur was the recipient of many distinctions, including election to the National Academy of Sciences in the United States. Among his principal works are: 'Etudes sur le Vin' (1866); 'Etudes sur le Vinaigre' (1868); 'Etudes sur la Maladie des Vers à Soie' (1870); 'Etudes sur la Bière' (1876). Consult Bournand 'Un Bierväerter de l'humanité' (Paris 1896); Cooper, F. C., 'Louis Pasteur' (a translation of Keim and Lumet's work, New York 1914); Devonshire, R. L., 'Life of Pasteur' (translation of Vallery-Rodot's work, London 1911); Gruber, 'Pasteurs Lebenswerk' (1896); Herter, C. A., 'Les Microbes' (1878); 'The Influence of Pasteur on medical science,' (Baltimore 1914); Vallery-Radot, 'Vie de Pasteur' (1900).

PASTEURIZATION OF MILK. See MILK.

PASTICCIO, pās-tich'ī-ō, from the Italian signifying "medley," an inartistic device among musical composers of the 18th century, which consisted of adapting some of their earlier compositions to a new text instead of writing new music for it. It was a common practice in the 18th century to revamp old music. Just as Shakespeare and other dramatists made use of old plays, which they brought up to date. But the composers of operas and other stage music took choruses and arias of older operas and adapted them or embodied them unchanged into new musical compositions, especially operas and musical comedies. Notable examples are the chorus 'For unto us a child is born' from Handel's 'Messiah,' originally the music of a madrigal written in 1712, and Gluck's 'Piramo e Tisbe' adapted to the best melodies of his earlier operas.

PASTILLE, pās'tīl or pās-tēl', a sugared confection, also an aromatic paste for burning,

as a fumigator or disinfectant. It is composed of gum benzoin, sandalwood, spices, charcoal powder and other substances. See **TROCHES**.

PASTO, pās'tō, Colombia, province of the department of Nariño; also the capital city of the province, 100 miles southeast of Popayan, on the Río de Pasto, a tributary of the Patia and at the southeastern foot of the volcano of Pasto, which is nearly 14,000 feet above sea-level. The city itself is about 8,500 feet above the sea-level, lies in a basin, two and a half by three miles in extent, of rare fertility and of brilliant verdure, has a college, a seminary, convents of the Franciscans, Dominicans and Augustinians and an episcopal palace, the University of Nariño; and is well built and laid out. It was founded in 1539; was twice burned during the war of independence, in which its inhabitants, mostly of Indian descent, showed rare loyalty to the Spanish crown, held Bolívar in check for some time and yielded only in 1822. The city was destroyed by earthquake in 1834. The main industries are manufactures of hats, blankets and pottery. Pop. about 30,000.

PASTON LETTERS, the collected correspondence between 1424 and 1509 of the Paston family of Paston, Norfolk. Covering the period of the Wars of the Roses and written in the frankest and homeliest way, these letters give important information as to the manners and history of the 15th century, showing particularly how undisturbed by war the greater part of the people of England were. They comprise over 1,100 letters and some state-papers in the possession of the family. There was a bitter discussion as to the authenticity of these letters, as the manuscripts could not be found after Fenn's death. But years afterward several volumes of the letters were encountered. The Paston letters were first edited by Sir John Fenn in five volumes (1787-1823); a popular edition by Ramsey appeared in 1840; but the best edition is that in the Arber reprints by Gairdner, in three volumes (1872-75) and enlarged to four volumes (1900-01).

PASTOR, a genus of birds belonging to the Starling family, found in the north of Africa, Syria and India. The name derived from the Latin pastor, shepherd, is due to their habit of congregating around sheep folds. The beautiful rose-colored pastor (*P. roseus*) is the only European specimen and being a good singer is a favorite cage-bird. It is also called the locust bird owing to its partiality for locusts as food. Its plumage is generally of a blackish-violet color, but various parts about the shoulders and abdomen are rose-colored. It has a prominent crest. In habits it much resembles the starling and it is of about the same size. Compare **MINABIRD**.

PASTOR FIDO, pās-tōr' fē'dō, II ("The Faithful Shepherd"), a pastoral drama by Giovanni Battista Guarini, played in Turin in 1585, but not printed until 1590. Composed in honor of the nuptials of a duke of Savoy, it has appeared in English in six different translations. It is the masterpiece of the author and its influence can be seen in all subsequent literature of this class. It went through 40 editions during the author's life and has been translated into almost all modern languages.

PASTORAL. See **LITERARY FORMS**.

PASTORAL EPISTLES. See **TIMOTHY AND TITUS, EPISTLES TO**.

PASTORAL LETTERS, circular epistles addressed by a diocesan bishop to those under his jurisdiction for purposes of instruction or admonition in matters of doctrine or discipline.

PASTORAL POETRY, Latin "pastoralis," relating to a shepherd, the description in verse of country life of an imaginary kind, in which the loves of shepherds and shepherdesses play a prominent part. As the modern pastoral poetry has continued to be based on the ancient classical pastoral poetry, which itself originated in the ceremonies performed in honor of the pastoral divinities, these latter have continued to form a part of the machinery of all pastoral poetry. Nymphs, satyrs and other imaginary inhabitants of the woodlands and the streams march through pastoral poetry as though of right they belong there, as in fact they do if long prior possession counts for aught. The pastoral, much in the form in which the classical writers present it, took root in the early life of the Greek people; but the customs and beliefs out of which the early pastoral sprang must be looked for nearer the beginning of the life of the wandering tribes who came later to form the Greek nation. As the life of the Greeks became more sedentary and the tendency toward culture and civic life more pronounced, the ceremonies, songs, dances and music with which the rural deities were honored began to assume a more complex character, due no doubt to the combination of various tribal ceremonies and the further influence of adjoining tribes upon one another. Thus gradually grew up the ceremonies indicated, and as they grew they possessed a strong power over the imagination of the Greek people, learned and unlearned. It is not at all strange, therefore, that the paraphernalia of the greater and lesser divinities of nature should enter into the pastoral poems of Greece in pre-Christian days. In fact it would have been very strange had they not since they formed an integral part of the life of the nation. Ælianus ascribes the invention of pastoral poetry to Stesi-Chorus whose real name was Tesia. But the title thus applied to him would seem to indicate that he simply extended the well-known songs and pastoral poetry already in use for a long time in connection with the religious ceremonies held before the shrines of the pastoral divinities. According to the ancient grammarians pastoral poetry originated in the worship of Artemis; but this is nothing more than a personification of its origin, for Artemis was not only "the healer" and the protector of all young; but she was looked upon as the goddess of flocks and the chase; and among the immortals she was the huntress. In all these respects she is the moon goddess, the patroness of all growing things. In Arcadia, especially, she was worshipped as the goddess of the nymphs. In this latter connection her surnames and epithets are almost all derived from the mountains, rivers and lakes. There she hunted with the nymphs and she held her dances in the forest with them and the 60 daughters of Oceanus. All this undoubtedly takes pastoral poetry back to an age in the history of the race when the Greek people were as yet nomadic and their chief culture goddess was Artemis, the huntress, dancing in the forest, hunting with the bows and arrows pre-

sented to her by the music-loving Pan, or riding, swift as the wind, in her chariot drawn by four stags with golden horns. The very antiquity of pastoral poetry and the sacred character that it long maintained are the causes that made it so deep rooted, surrounded it with the wood and water spirits and connected it with shepherds and shepherdesses out of a nation of whom it sprang. So extensive was the worship of Artemis and so elaborate the ceremonies, that there came into being much pastoral poetry that has completely disappeared.

Early Pastorals.—The oldest of the pastorals that have come down to us date from the 3d century B.C. and are ascribed to Theocritus to whom are attributed 31 idyls, in which are reproduced the language of the peasants and the life of rustics with their songs and beliefs. Some of these short descriptive lyrics are combined with short comic or dramatic parts, which show that the religious poetry of an earlier and more primitive age had already become, in a manner, divorced from its earlier associations. These poems of Theocritus are simple and, in a sense, natural if it is kept in mind that the supernatural characters that appear in them were as fully believed in as were the saints in the Middle Ages. Bion of Smyrna and Moschus followed Theocritus as pastoral poets. All of these seem to have gone to nature for their inspiration and descriptions and they succeeded in creating a school which was widely imitated throughout the Greek and Latin countries. Of the Latin writers who seized upon the Greek pastorals, the greatest was Virgil (70–19 B.C.), who idealized the scenes and ideas presented by the Greek writers and made them depend more upon imagination than upon observation. With him art stepped in and, in a sense, conventionalized the forms, instinct, for the ancient Greek, with pregnant meaning. Here was the beginning of the real pastoral poetry, which was later on to take such a hold of western Europe, for Virgil set a fashion in his "eclogue" which was followed by Horace and other Roman poets; who tended to conventionalize more and more the machinery of the early Greek religious pastorals, until they were finally worked into a condition suitable to appeal to Christian Europe.

Italy.—In the meantime there had sprung out of the old Greek and Latin pastorals rustic pastoral songs, often with much of the dramatic in them in all the countries of Western Europe. These were probably due more to the pastoral worship and its ceremonies than to the work of the Latin and Greek pastoral poets. But the two combined to form or inspire the pastoral poetry of the Renaissance. As early as the 12th century the "pastourelles" made their appearance in Provence and a century later, at least, they were popular in all the Latin and Germanic countries. Early in the 14th century the pastorals became profoundly influenced by the new learning, or the revival of the study of Virgil and other Latin writers; and from this sprang the more modern pastoral poetry. Dante, Petrarch, Boccaccio and other noted writers of the century wrote pastorals. The 'Ameto' (1342) of the latter is the first pastoral romance written in the Italian tongue. It is partly in prose and partly in verse, the latter being used to express intensity of feeling. 'Ameto' became very popular and set the fashion for succeeding poets. In it Boccaccio, under fictitious

names, expresses his secret love for Maria, daughter of Robert, king of Naples, in graceful and forceful prose and passionate and tuneful verse; and the new and yet familiar literary style of the 'Ameto' fitting in so well as it did, with the popular songs, and contrasting so strongly with the artificial and exotic literature of the period, appealed strongly to the Italian people then rising into nationality out of the ruin of things Roman. Dante also composed a pastoral of 12 eclogues imitated from Virgil, but containing an elaborate allegory. The work of Dante, Petrarch and Boccaccio, all of whom wrote Latin eclogues much after the manner of Virgil, marks the beginning of the pastoral movement, which, with numerous ups and downs, was to exercise a strong and lasting influence upon the literature of Western Europe into the beginning of the 19th century. Boccaccio, in his 'Ninfale Fiesolano,' gave a dramatic turn to the pastoral; and this, with the crossed love plot and secret personal history, became popular literary machinery for subsequent Italian writers, who expanded the pastoral into drama as soon as the mediæval mystery play had begun to lose ground in the popular estimation. Baptista Spagnolus, the Mantuan, who wrote during the last quarter of the 15th and the first part of the 16th century, used the pastoral, in a semi-dramatic form, to satirize, through his rustic characters, the court, the church and the women of the day. Other writers of dramatic pastorals were busy at this time. Of these the best, and most lasting and of far-reaching influence, was Poliziano, who in 1372 put upon the stage at Mantua, a pastoral-drama opera founded on the story of Orpheus and Eurydice, and appropriately entitled 'Orfeo.'

The happy choice of subject necessarily called for the music of Orpheus and gave a turn to the pastoral which undoubtedly had considerable to do with the subsequent development of the opera. Already little private court stages were springing up all over Italy, court pastoral drama was becoming very popular, and it was destined to exercise a powerful influence on the Italian tongue and literature, the latter of which it practically dominated in the final third of the 16th century, during which it produced some of the best poetry then written in Europe. The requirements of these court theatres, the taste of the auditors, accustomed to the court ballad, and the tendency of previous pastorals made the musical part of the performance of more and more importance and drove out of the dramatic pastoral the tragic tendencies noticeable in previous writers. Thus the pastorals were forced along the high road to opera, which finally dominated the pastoral element, originally the life of this form of dramatic literature.

In 1573 Tasso presented, at the court of Ferrara, his 'Aminata,' a dramatic pastoral, which became at once very popular and came to be known throughout all the Latin countries, where its influence upon subsequent literature was considerable. Alvioso Pasqualigo, who followed Tasso, added the comic element to the dramatic pastoral, and Cristoforo Casettelletti endowed it with the heroic and romantic; Guarini in his 'Pastor Fido' (1590), made the dramatic pastoral still more popular and wider reaching, and Ognaro, in his 'Aloeo' (1591) added to the pastoral literature of Italy a pas-

toral devoted to fishermen. Thus the pastoral continued gathering to itself all the mechanical, poetical and human elements that led along the road to modern drama and opera, and especially the latter.

Spain.—Along this road the milestones are still standing. In 1504 Jacopo Sannazaro produced his 'Arcadia,' a non-dramatic pastoral, which set the fashion for many subsequent pastorals and exercised a strong influence on every literature of the Germanic and Latin countries, whose poets sang the glorious "spirits of the wood," the artificial shepherds and shepherdesses and other rural characters, moving and acting unconcernedly in a brilliant world of supernatural beings. Sannazaro was the legitimate successor of Juan de Encina, Gil Vicente and Garcilaso de la Vega, who had introduced the Italian pastoral movement into Spain. The latter's 'El dulce lamentar de los pastores,' published in the first quarter of the 16th century, was widely read and extensively copied. Jorge de Montemayor, in his 'Diana' (1524), successfully imitated 'Arcadia,' and this Gaspar Gil Polo continued in 'Diana enamorada' (1564). This latter also exercised very considerable influence upon the direction of the highway of pastoral poetry; and Cervantes himself bears witness to the popularity of these dramatic pastorals, which influenced the creator of the sorrowful knight to write 'Galatea' (1584), a most charming and musical pastoral.

France, although rich in all the poetical elements that went to produce the pastoral drama and pastoral poetry in general, never attained any high achievement in this department of literature. There was plenty of pastoral poetry produced in France, however; but it took a different direction, which was unfortunate for its artistic development. The pastoral song, which is generally about love, is found high in popular estimation in southern France in the 13th century. In this latter form it dates back to the previous century; but it was undoubtedly of a much earlier origin. In fact, it seems to have been the survival of the old Roman May or Spring dances and ceremonies, which had been reacted upon by similar religious ceremonies of the Gaulish tribes; and out of this had sprung popular celebrations of the coming of the growing season. After the disappearance of the Latin religion these ceremonies survived under Christianity by which they were in some measure early modified. As their real religious significance began to die out, the dances lost their sacred character, and the songs sung at them became the common property of those taking part in the Spring dances. These were repeated in various modified forms and about them sprang up the pastoral songs so popular in southern France during the period mentioned. Naturally, their influence was most noticeable in Provence, because of the stronghold which the Roman religion, customs and civilization had secured there previous to the breaking up of the Roman Empire. These early pastoral songs spread over all France; but those of the North seem to have had their own independent origin much similar to that of the songs of Provence. When the influence of the Italian pastoral poetry reached France, the nation had long been going through a preparatory course, which had made her not only ready to receive it but to assimilate it;

for France has ever been inclined to do things in her own way. So she proceeded to reshape the Italian pastoral and to blend it with her own "pastourelles" and her unnatural chivalric romances. The result was inferior to the pastoral poetry of Italy and Spain. Yet it had one merit. It was more or less national in form and sentiment; and it therefore probably had more influence on succeeding French literature than it might have had, had it been more like the Italian and Spanish pastorals. The French pastoral continued developing artificial qualities until it finally wore itself out by its own artificiality. The knights who went among the begemmed and lavishly-dressed nymphs were as gorgeous and unnatural as ever the imagination of chivalry produced. The greatest of the French pastorals, the 'Astrée' (1610) of Honoré d'Urfé is a culmination of the tendencies of the times. Based on the 'Aminta' of Tasso and the 'Diana' of Montemayor it received its inspiration from the same source as the 'Amadis' chivalric stories. It is written in prose, a long romance of the kind the age delighted in. Camus de Pontcarré wrote a series of pastorals from the Christian point of view and avowedly to counteract the heathen tendencies of the popular 'Astrée'; and Racon, imitating the 'Astrée,' wrote 'Les Bergeries' (a pastoral drama 1625).

England.—Real pastoral poetry in England may be said to have begun with Edmund Spenser's 'Shepherd's Calendar' (1579). Previous to this, it is true, there had been realistic shepherd scenes in the religious drama; but they were all far from the spirit of the European pastoral; and they lacked the inspiration of the Latin mythology which had failed to get in England the hold upon the people that it had upon the Continental domains of the Romans. Alexander Barclay had written a long pastoral in 1552 and 11 years later Barnabe Googe wrote another. But both were very inferior to the work of Spenser, who aimed at simplicity and naturalness. The 'Shepherd's Calendar' became popular; but it was soon overshadowed by Sir Philip Sidney's 'Arcadia' (1590). This romance, with its stately and formal characters, suited the spirit of the age and found many imitators who exaggerated its worst tendencies. About the same time three other popular pastorals made their appearance and all were inspired by the same literary vision as the 'Arcadia.' These were Robert Greene's 'Moranda,' Lyly's 'Gallathea' and Peele's 'Arraignement of Paris.' The latter two were pastoral dramas, and as such became widely known. Greene also wrote two love romances in the Italian manner, 'Never too Late' and 'Menaphon.' In 1590 Thomas Lodge published his 'Rosalynde,' a fantastic romance, that has in it more true poetic form and expression than most of the pastorals of his day. About this time John Dickenson wrote 'The Shepherd's Complaint' an eclogue and 'Risbas'; Drayton his 'Endimion and Phœbe' and 'Shepherd's Garland'; Barnfield, 'The Affectionate Shepherd' and Lyly, 'The Maid's Metamorphosis.' Long after the influence of Tasso and other pastoral poets had died a natural death, England continued to produce pastoral poetry of a lighter sort, most of which was imitation of 'The Shepherd's Calendar.' The best of these were Nicholas

Breton's 'Passionate Shepherd' (1604); Day's 'Isle of Gulls' (1606); Fletcher's 'The Faithful Shepherdess' (1610); Wither's, 'The Shepherd's Hunting' (1615); Braithwaite's 'The Poet's Willow' (1613); 'Shepherd's Tales' (1621); William Browne's 'Britannias Pastorals' (1616); Phineas Fletcher's 'Piscatory Eclogues' (1633); Thomas Goffe's 'Careless Shepherd' (1635); Ben Jonson's 'Sad Shepherd' (1635). From this date on serious bucolic pastoral poetry may be said to have ceased to occupy the attention of literary England. The pastoral idea, however, continued to live in song in the style of Breton and Wither. Among the writers of this class are Lovelace, Stanley, Carew, Cartwright, Suckling and Herrick, the latter of whom is by far the most natural and best. He was the first of the English pastoral writers to paint truthfully the beauties of rural life. About the same time Shirley's 'Arcadia' (1640); Fanshawe's 'Pastor Fido' (1646); and Willan's 'Astræa' (1651) were converted into pastoral drama. For the next half century English pastoral poetry and especially the drama are inartistic, artificial and uninteresting. The beginning of the 18th century, however, saw a revival of the pastoral at the hands of such clever writers as Pope, Ambrose Philips, Steele and Gay. Their pastorals, however, fall short of their achievements in other literary fields. Gay's 'Shepherd's Week' was a return to the simplicity of the early pastoral verse and his influence on English literature was good. But the most influential of all the pastoral writers of the period was Allan Ramsay, whose 'Gentle Shepherd' written in Lowland Scotch, brought that forceful tongue into favorable literary notice and paved the way for the coming Scotch literature. 'The Gentle Shepherd' continued popular into the middle of last century. From this time on the pastoral, as such, was dead in England, but its influence is seen in the work of Cowper, Burns, Shelley, Landor, Thompson, Tennyson and several modern Scotch writers.

JOHN HUBERT CORNYN,
Birmingham Southern College.

PASTORAL STAFF, the official staff of a bishop or archbishop. The pastoral staff of an archbishop is distinguished by being surmounted by a cross, and is accordingly called a crozier. The pastoral staff is in the form of a shepherd's crook. When carried by a bishop it was held in the left hand with the crook turned outward, indicating his jurisdiction over a diocese; when assumed by an abbot, it was grasped in the right hand, with the crook turned backward, showing that his jurisdiction was limited to the members of his own house. The pastoral staff is made of ivory or wood, enriched with precious metal or jewels.

PASTORAL SYMPHONY, *The, or RECOLLECTIONS OF COUNTRY LIFE*, Beethoven's Sixth Symphony F major, opus 68. The musician had a passion for the country, and has composed two pastoral symphonies of which the one here mentioned (1807) is the most famous. One passage of it suggests the sound of gnats buzzing in the evening twilight, and in some phrases are represented the notes of birds, and the murmur of winds and waters; the prevailing tone is joyous. It was produced for the first time at Vienna, 22 Dec. 1808.

PASTORAL THEOLOGY, that section of theology which treats of the personal and official duties of a Christian minister in his church and parish. It covers particularly his relations with his parishioners as individuals and also those with the public at large as representing his church. In the Roman Catholic Church and the Church of England these duties devolve upon the curate.

PASTORALE, *in music*, a composition of an idyllic character; also a composition for a dance, generally in six-eight or twelve-eight time.

PASTORELS, a variant form of Pastoureaux (q.v.).

PASTORIUS, Francis Daniel, American colonist: b. Sommerhausen, Germany, 1651; d. 1719. He visited England and there became a member of the Society of Friends and made the acquaintance of William Penn, to whose colony of Pennsylvania Pastorius, in 1683, emigrated at the head of a company of Mennonites from Germany and Holland, and settled at Germantown, now a part of Philadelphia. Piety and learning were united in Pastorius to practical energies and qualities of leadership, whereby the influence of his character was made deep and lasting among his followers. Within five years of his coming to America he signed a protest to the Friends' yearly meeting in Burlington N. J., which declared slavery to be unchristian, and which, as the first formal anti-slavery declaration made in this country, was celebrated by Whittier in his 'Pennsylvania Pilgrim.' To the Germantown book of records Pastorius prefixed a Latin ode addressed to posterity, which was translated by Whittier. Pastorius also wrote a 'Geographical Description of Pennsylvania' (1700), which was originally published with a German title.

PASTOUREAUX, päs-too-rô', bands of French peasants who attempted in the 13th and 14th centuries to better their pitiful conditions by appeal to arms. There were three of these risings. The first, in Berry in 1214, was aimed against both the feudal lords and the monasteries, but was quickly and severely repressed; the second, in Flanders, in 1250 under the lead of the "Master of Hungary," pretended to be a crusade to recover the Holy Sepulchre. Its members assumed priestly functions and denounced the wickedness of the clergy. Nothing could be done to check its excesses until the body numbering 60,000 or 100,000 men divided after leaving Paris into several companies, which were speedily attacked and slaughtered by the king's forces. The third rising of the Pastoureaux in 1320 was again composed of illuminés and again under cover of a pretended crusade; it laid waste Berry, Saintonge, Aquitaine and Languedoc, and killed 500 Jews at Verdun-sur-Garonne. Near Aiguesmortes they were hemmed in; many died of starvation and others were hanged and imprisoned.

PASTURE, grass-covered land upon which domestic animals are placed to graze. In its broad application the term includes the unenclosed grazing areas of the western ranges, the Argentine pampas and the Russian steppes. In a narrower and more popular way it refers to the enclosed fields similarly used upon farms. Small enclosed pastures close to farm buildings

are frequently called paddocks. Since many things, especially drought, may occur to impair the productivity of pastures, it is customary to grow fodder crops, especially corn, in proximity to the pasture, and to cut this crop as occasion may require. This serves the double purpose of supplying the animals with needed food and preventing the injurious, close grazing of the pasture. An essential adjunct of pastures is an adequate supply of pure water available at all times to the animals; and a highly desirable feature is shade, best furnished by trees located at the highest points, the margins and on the poorest soil of the field.

Pastures differ from meadows in the character and habits of the plants which grow upon them. Whereas meadow grasses and other plants are usually tall-growing and ready to cut all at one time, the herbage of pastures is generally low-growing, and the various species reach maturity at various times throughout the season. The former are often "stooling" or "tillering" grasses, the latter creeping and mat-forming. The selection of species is largely dependent upon the climatic and soil conditions and also upon the length of time the pasture is to remain. For temporary pastures short-lived grasses are often used, but for the permanent pastures the perennials and turf-forming species should be chosen. Timothy (*Phleum pratense*), the leading meadow and hay grass in the eastern United States, is sometimes seeded for pasture but its stooling habit, its inability to form a good turf and its liability to injury by the trampling of the animals, are decidedly against its use in pastures. For the Southern States, Texas blue grass, Bermuda grass, carpet grass, large water-grass are probably in most general use, the first two particularly. On light, sandy soils creeping bentgrass, Kentucky blue grass, red fescue and white clover are in popular use. On wet soils perennial rye-grass, redtop, or creeping bentgrass, and alsike clover are in general use. In regions where the rainfall is adequate and upon ordinary soils the following are general favorites: Kentucky blue grass, tall fescue, Canada blue grass, redtop, perennial rye-grass, orchard-grass and white clover. Red clover and alsike are also planted to some extent, but they are rather tall growing for pasture plants. The botanical names and characteristics of these plants are described under GRASSES OF THE UNITED STATES.

In general, the best pastures are formed upon well-drained, but moist, loamy soils, varying in quality from clay to rather sandy loam, but not usually including what are termed sandy and gravelly soils. As a prime necessity they must be rich in all plant foods, especially nitrogenous and organic material. The former is essential to the luxuriant growth of herbage, the latter to improve the physical qualities of the soil, particularly texture and water-retaining capacity. To supply these elements, barnyard manure is most frequently employed and, when properly cared for and applied, is best. It is insufficient, however, even with the droppings of the animals, to keep the land in its best producing condition. Hence, commercial fertilizers must be applied liberally; phosphoric acid and potash at any season and nitrate of soda and other quickly soluble fertilizers in the spring or dur-

ing the summer. These remarks apply to the annual management as well as to first preparation. The land should be deeply plowed, thoroughly harrowed to make the surface as fine as possible, the seed sown on a windless day—if possible just before a rain. Since little weeding can be done, it is highly desirable to purchase as clean seed as possible, the high price for "re-cleaned" seed being more than repaid in the quality of the crop. Often for permanent pastures short-lived grasses may be mixed with the perennial sorts in order to choke weed-growth. The perennials do not suffer but soon gain possession of the ground. When the plants are growing well the field should be mowed close to the ground in order to destroy the taller weeds and prevent their production of seed; and this should be repeated several times each year until the grass has full possession. This labor may be lessened in many cases by turning sheep upon the pastures previously occupied by cattle or horses because the sheep eat many weeds that the other animals ignore. Harrowing pastures in early spring is considered advantageous, since it admits light, heat and air and reduces the struggle among the plants. Reseeding pastures is generally not advisable, plowing and planting to other crops for several years being preferable.

It is generally found advisable to pasture the various domestic animals separately, since cattle and horses may annoy or even injure one another, and since sheep crop the grass so closely that they deprive the larger animals of their share. Dairy and beef cattle are generally pastured separately because of the differences in their general management. Great care must be exercised to pasture no more animals upon a given area than can be easily fed from it. When too many are present the animals not only kill out the grass but encourage the growth of the weeds they will not eat. (See LAWN; MEADOW). Consult Spillman, J. W., 'Farm Grasses of the United States' (New York 1909); Sutton, M. J., 'Permanent and Temporary Pastures' (London 1911).

PATAGONIA, păt-a-gō'ni-ă, South America, a name formerly used of all the southern part of the continent, but now used of the region bounded on the north by the Rio Limay and the Rio Negro, the Atlantic on the east, the Strait of Magellan on the south and the Andes on the west. The region, discovered by Magellan in 1520, was practically unexplored (save by Darwin in 1839) until 1869. Since then, however, it has been explored by Musters, Moreno, Moyano, Fontana, various officers of the Argentine army and scientists, and in 1896-99 by a Princeton University expedition, led by J. B. Hatcher. The country is a tertiary plateau with terrace-like drops to the sea-level at the coast, so that the etymology of the name seems to be from Quichua *patacuna*, "terraces." There are many volcanic rocks, especially basalt; a few volcanoes even in the Andes, Fitzroy being the most important; and many large salt lakes. The climate is cold, the region lying between the isotherms of 14° and 7° C. At Rawson the temperature has a maximum of 31° C. in January and a minimum of -7° C. in June. The climate and temperature closely resemble those of South Africa. The flora is

scanty in the extreme south and everywhere differs very remarkably from that of the surrounding country. Along the river courses there are willows; peculiar vegetation marks the salt lagoons, and in the tertiary plateau the plants resemble those of the Mendoza, and there are many cactuses. The fauna also is scanty. The birds are of particular importance as showing many unusual instances of specialization. Families which everywhere else live in trees have here lost their arboreal habit and nest on the ground. There are wild horses and cattle. The "Patagonian giant" has been greatly exaggerated; Mr. Hatcher gives the average height of the men as 5 feet 11 inches, weight 175 pounds, and of the women, height, five feet seven inches and weight about that of the men. They were nomads. The Roca expedition of 1880 almost wiped them out. The entire region was long unclaimed. Later it was disputed between Argentina and Chile, and was finally divided between these two powers, the Cordillera being the boundary by the convention of 23 July 1881. The portion belonging to Chile is now known as Magallanes, while Argentine Patagonia consists of three political divisions: Rio Negro, Chubut and Santa Cruz; so that Patagonia has now no separate political existence. Consult Campbell, 'Through Patagonia' (1901); Musters, 'At Home with the Patagonians' (1871); Prichard, 'Through the Heart of Patagonia' (1902); and 'Reports of the Princeton University Expeditions to Patagonia, 1896-1899.'

PATALA, pā-tā'la, the Hindu lower regions, described in the Puranas as seven in number, each being more than 3,000 leagues in depth though some authorities say there are eight Patalas. They are inhabited by demi-gods of various kinds and orders, who live luxuriously in splendid mansions, feasting on choice viands and fruits, and quaffing delicious wines. They wander at will amid glorious forests along streams and by the side of lakes whose banks are covered with flowers, while the lotus floats upon the bosom of their waters. The Patalas should not be confounded with the Narakas, or infernal regions, with which they seem to be in no way related. They are the home, among other supernatural beings, of the Nagas or mythological serpents.

PATAMAR, a native sailing vessel common along the coasts of India. It is about 75 feet long, 20 feet broad and 12 feet deep, with a burden of about 200 tons. It has two masts, with lateen sails. Smaller ones have but a single mast. They have a prow stem the same length as the keel. It is fast, and on this account was formerly much used in the carrying of dispatches; but in this business it has been replaced by steam launches.

PATAN, pa- or pū-tān', variant spelling of Pattan (q.v.).

PATAÑJALI, pa-tūn'ja-lī, Sanskrit grammarian, who wrote about 140 B.C. (or possibly as late as 25 A.D.), a commentary called Mahābhāṣya, or 'Great Commentary,' on the previous work of Pāṇini (q.v.), and especially on the criticism of Pāṇini by Kātyāyana; this work, edited by Kielhorn 1878-85, is one of the most important sources of our knowledge of Sanskrit grammar. Patañjali, whether the

Grammarian or another, is the reputed founder of the Yoga system of philosophy, which proclaimed that salvation and bliss were to be attained by the union of the individual soul with the great soul, Īśvara, and that this can be attained by austere life and meditation. He is generally credited with being the author of the Mahābhāṣate; but it is quite possible that there were two writers of the same name. If so, this would explain the uncertainty as to even the century in which the grammarian lived.

PATAPSCO, pa-tāp'skō, a river of Maryland, flowing into Chesapeake Bay, 14 miles southeast of the city of Baltimore. It enters the bay by a large estuary, which forms the harbor of Baltimore, and is navigable for the largest vessels. The entrance to the river is protected by Fort Howard, built upon a promontory near where the Battle of Northpoint was fought in the War of 1812. See BALTIMORE.

PATAS MONKEY, a reddish guenon (*Cercopithecus potas* or *Erythrocebus potas*) of western equatorial Africa. It is notable for its reddish color and its grayish checks and under parts.

PATCH, Edith Marion, entomologist: b. Worcester, Mass., 27 July 1876. Educated at universities of Minnesota, Maine and Cornell where she specialized in entomology. She organized the department of entomology of the Maine Agricultural Station of which she has since (1903) been entomologist. Her work there, which has been conducted along experimental lines of a highly educational nature, has made her name well known throughout the United States and Canada. Her research deals largely with problems relating to ecology and economic entomology. She has written much for magazines and has published several stories quite different from her serious technical and official work. Among these are 'Dame Bug and her Babies' (1913); 'How Laddie Tells the Time O' Year' (1914).

PATCH, Kate Whiting, American writer: b. Elizabeth, N. J., 22 Aug. 1870; d. 1909. She was married in 1893 to F. W. Patch, a physician of Framingham, Mass., and is the author of 'Middleway' (1897); and the juvenile books, 'Rainy Days and Sunny Days' (1899); 'Old Lady and Young Laddie' (1900); 'Prince Yellowtop' (1903).

PATCH, Samuel, American athlete: b. Rhode Island, 1807; d. Rochester, N. Y., 13 Nov. 1829. He went to sea when very young, and later became a cotton-spinner at Paterson, N. J. He made a reputation for feats in diving, the leap which he took from the bridge spanning the Passaic, a distance of 80 or 90 feet, into the pool below the falls, attracting widespread attention, and he thereafter traveled over the country, diving from topmasts and bowsprits of vessels. At Niagara Falls he made a leap of more than half the height of the falls, but dissatisfied with this performance he advertised a leap of 125 feet at the Genesee Falls, in which he lost his life.

PATCHES, are small pieces of silk or court-plaster used on the face to apparently heighten the complexion by contrast. During the 17th and beginning of the 18th century these fantastic ornaments were commonly worn by women and sometimes by men. In the United

States the practice was revived in the 20th century by fashionable people in some circles of society.

PATCHOGUE, păt-chōg', N. Y., village Suffolk County, on the southern coast of Long Island, on Great South Bay, and on the Long Island Railroad, 51 miles east of New York. It was incorporated as a village in 1893. Its most important industries are oystering and fishing; it has good dock facilities, and is one of the chief harbors for the fish and oyster boats of the bay. It has also a cold storage plant, and a number of manufactures, including lace, paper, lumber and surveyors' supplies. It is a favorite place of residence, one of the popular summer resorts of Long Island and contains several hotels. It has fine residences, handsome churches, a high school and a public library. The governing body is a board of trustees, and the executive a village president, who holds office for a year. Pop. (1920) 4,031.

PATCHOULI, păt-choo'li, known in India as "puchapat," a perfume obtained from the dried leaves and branches of the *Pogostemon patchouli*, a mint of India and China, where it is cultivated on a large scale; the plant has also been acclimatized in France. The branches and young leaves are highly odoriferous, like sandal-wood, but the perfume is much more intense. The essence obtained from them by distillation is a kind of heavy dark-brown oil, which nullifies the effect of an equal weight of any other vegetable perfume which may be mixed with it. It is used in India to scent the costly Cashmere shawls, with the view of keeping out moths. Hence real Cashmere shawls were known by their scent, until the French, who had succeeded in imitating the fabric, found out this secret also, and imported the plant for a like use. In Asia it is also used for scenting ink-cakes, tobacco and hair-oil, and is everywhere valued as a preservative of woollens and linens from insects. The pure essence, having a disagreeably powerful odor, requires to be greatly diluted for the purposes of the perfumer.

PATE DE FOIE GRAS, pā-tā' dē fwā grā (paste of fat liver), "Strassburg pie," a French article of food, made from the livers of geese, and much relished by epicures. It is a sort of potted meat considered a great delicacy, which is made in different parts of France, but chiefly in Strassburg and Toulouse. Fowls are fed and stuffed artificially with salted grain, chiefly Indian corn, which makes their livers grow abnormally large. These livers, prepared in a special way and covered with melted goose fat to keep them protected from the air, are usually packed in earthen pots, though of late the cheaper grades, especially the imitations made outside of France, are sometimes put up in tin cans.

PATELLA, the kneecap or kneepan, an irregularly oval bone covering the knee-joint, developed in the tendon of the large muscle of the thigh, which is made up of the rectus femoris, vastus internus and externus, vastus internus and the quadriceps extensor cruris. This muscle becomes narrowed down at its lower end, and forms the ligamentum patellæ, which is attached to the front surface of the tibia, and is one of the important muscles in extending the leg. It has developed at its

lower end the sesamoid bone, the patella, over which it slides. It is a flattened bone of triangular cross-section, thickest in a vertical line in the centre. Its front surface is rounded and is attached to the tendon of the muscles; its back surface is covered with cartilage and forms an important part of the knee-joint, articulating with the femur at different places as this bone is moved. In front of the patella, separating it from the skin, is a bursa. Affections of the patella are not rare: Inflammation of the bursa is common in those who are compelled to be on their knees continuously. A chronic condition known as "housemaid's knee" results from this, and is often extremely difficult to treat. An equally common condition is a mild inflammation of the synovial mucous membrane behind the patella. This is a condition sometimes set up by violent athletics, excessive exertion as in tennis, football, skating, bicycling, etc. It usually follows some injury of the knee, and may result in partial stiffening of the joint. Rest, hot applications, and a plaster bandage are the best preventives of this condition. Following gross accidents, dislocation or fracture of the patella may occur. Dislocation is a rare accident, and usually is the result of direct violence. The patella may be dislocated either toward the inward or the outward side of the leg; most frequently the dislocation is outward. The sudden limitation of motion, together with the appearance of deformity, renders the diagnosis simple. Reposition is also easy. Fracture may result from direct violence, or it may result from sudden forcible stiffening of the great muscles of the thigh. Such a fracture is usually transverse, one portion of the bone remaining fastened by the stiff ligament, the upper portion usually being pulled some distance—half an inch to two inches—away by the thigh-muscles. Treatment of this accident may be by rest and by bringing the parts together after absolute muscular relaxation, further keeping them in position by a plaster of paris bandage; or it may consist of the surgical procedure of wiring. In this operation an incision is made and the two fragments are drawn together and firmly fastened in position by means of silver wire. Plaster bandages are worn for several months, as in the conservative operation; and the results will vary greatly, according to results of the inflammatory processes, and the personal equation of the patient's own bone-vitality. The results in most instances are fairly satisfactory. A stiff knee may follow; a weakened knee is always to be expected.

PATELLAR REFLEX. See KNEE JERK.

PATEN (Latin, *patina*, a plate or dish), in ecclesiology, the plate or salver on which is placed the element of bread in the eucharistic service. In ancient times it was often made of wood or glass; but as the Church became more wealthy, patens were made of gold or silver, some richly ornamented with gems and enamels.

PATENT MEDICINES. This term is quite usually, but erroneously, applied to that class of medicinal preparations which are put up in uniform packages and which are offered for sale under distinctive trade marked or copyrighted names. These remedies, which are made in liquid, solid or semi-solid form, are articles of almost universal household use

throughout the United States, and are very frequently prescribed, either separately or in combination, by physicians. Patent medicines are usually combinations of well-known drugs. They are not (with very few exceptions) patented, but are more correctly designated as "Proprietary medicines" (because those who manufacture them have proprietary rights in formulae, trade names, etc.) or "package medicines." The term "patent medicine" originated from royal patents, or marks of favor, granted by early English kings to the originators of meritorious medicinal compounds, and the name, as well as many examples of the products, were brought to America by early immigrants. Many widely used and generally known medicinal products were originally patent medicines, among which class might be cited Dover's powders, paregoric, etc. Usually (but not always) these so-called patent medicines are sold as complete preparations, the formulae from which they are manufactured being the exclusive property of the manufacturer. In a majority of cases they originated with practising physicians whose favorite prescriptions they were and some of them have been on the market over 100 years; many over 50 years and a much larger number over 25 years. Many preparations which originated as so-called "patent medicines" have been admitted to the United States Pharmacopœia, the pharmacopœias of other countries, the National Formulary and other similar works, and many meritorious and useful drugs have first been introduced to *materia medica* through their use in patent medicines. Many instances of such introductions might be cited. Among these are quinine, echinacea and cascara. Many well-known patent medicines have been introduced to the public by the prescriptions of practising physicians. The place of "patent medicines" in domestic economy is so well established that, during the World War when American industry was, by government restrictions, put on a "win the war" footing, the patent medicine industry was included among those industries, considered essential to public welfare, placed on the government priorities list and allowed its full requirements of such necessities as sugar, alcohol, glycerine, coal, etc., which were denied (or allowed in reduced amounts), to many other industries. The American manufacture of package medicines dates back about a century and a half. Latest available United States Census Bureau statistics (for the commercial census of 1914) show 2,271 establishments chiefly engaged in the manufacture of patent and proprietary medicines and compounds. The value of the output (at manufacturers' prices) was approximately \$83,000,000 for 1914. It shows a steady growth from the time of first government statistics on the subject. Approximately 25,000 people were employed in 1914; the invested capital was about \$80,000,000. In addition to the 2,271 establishments engaged chiefly in the manufacture of patent medicines, there is a large, but undetermined, number of others with whom the manufacture of patent medicines is not the chief part of business. Many retail druggists manufacture one or more medicines which are sold under trade or proprietary names. No attempt has been made to secure data of this class of manufacture, but in the aggregate the number of preparations,

and the total output reckoned in terms of dollars is a very large sum.

The manufacture of patent medicines is carried on to some extent in practically every State in the Union, except Arizona, Idaho, Nevada, New Mexico and Wyoming. New York leads with 806 establishments, Illinois is second with 363, Pennsylvania third with 324, Ohio fourth with 252, Missouri fifth with 212, Massachusetts sixth with 162, Indiana seventh with 156, Michigan eighth with 142, etc. The patent medicine industry is known for the extent and mechanical and sanitary completeness of many of its laboratories. Manufacturing is frequently done on a large scale, with modern machinery and appliances for testing and proving materials and products. In some instances the crude drugs used in the manufacture are grown for the manufacturers, in others they are gathered under the supervision of representatives of the manufacturers, and in a greatly larger number they are obtained from drug importers or millers, and every process of manufacture is carried on in the manufacturer's laboratory. In other cases partially prepared ingredients are purchased and combined, and in still others the actual manufacturing is done by manufacturing chemists (several of whom have large and completely equipped plants for that purpose), while only the bottling or packing is done in the establishment of the proprietor. Distribution of the product is usually through the wholesale drug houses and retail drug stores and 52 per cent of the gross business of wholesale drug houses is in this class of merchandise.

PATENT OFFICE, United States. See PATENTS, THE LAWS OF.

PATENTS, The Laws of. The extraordinary industrial and commercial development of the United States during the 19th century was due primarily to three causes: Physical, social, legislative. The extraordinary natural wealth of the country was not fully appreciated even 25 years ago. Its vast agricultural possibilities were disclosed earlier in the century with the opening up and development of the great West. Its abundance of forest lands, of course, were recognized, but not its great mineral resources, its great deposits of copper, its high grade iron ores, and the full meaning of the contiguity of these iron ores to vast coal fields bearing the richest deposits. These physical resources, however, might not have yielded to such rapid growth were it not that a race of men was at hand singularly adapted to carrying forward the work of the country's development. The aggressiveness, courage, energy and brains necessary for the work were the result in part, perhaps, of the assimilation of strong men of different nationalities, and partly, perhaps, to the energy derived from climatic conditions. The vast industrial development, however, which has gone forward with leaps and bounds in all sections of the country, would have been impossible had it not been for the wise laws which more than anything else have served as a stimulus to such development. It has been estimated that seven-eighths of our industrial enterprises are dependent directly or indirectly upon our patent system, or that such enterprises owed their being originally to our patent laws. The beneficence of our patent system is now pretty generally recognized, but

this attitude is of comparatively modern growth. The prejudice which existed against patents as monopolies during the 18th century and the early part of the 19th century was a perfectly natural one.

Patent History.—The granting of patents to individuals or guilds was of very early origin and reached its greatest abuse in England during the reigns of Elizabeth and James, when the granting of exclusive monopolies under letters patent to individuals or corporations for the manufacture or sale of certain classes of commodities or luxuries was an easy although scandalous method of filling the royal exchequer. The early monopolies were of two kinds, legal and illegal. To the first class belong such as are conferred on the inventors of a new manufacture or the introducer of new trade, and to the second class belong the exclusive grants to individuals or corporations to manufacture and sell commodities or necessities of life, such as salt, tobacco, etc., thereby restricting trade and preventing those who had established such industries from obtaining a livelihood therefrom. The famous Statute against Monopolies, 1623, put an end, however, to these abuses, but the word "patent" carried unfortunately the taint of its early abuse, and for a century or more patents were looked upon askance. The law of patents in its modern significance, however, did not begin to be understood until the 19th century had dawned. In the United States the law of patents rests not upon common law, but upon statutory provision. In early colonial days patents were issued by the Colonial governments. The earliest patent issued in this country appears to have been granted by the General Court of Massachusetts Bay Colony, in October 1641, to one Samuel Winslow for a process of manufacturing salt. The term of the patent was for 10 years and the grant was conditional upon works being established within the year. In 1656 Massachusetts Bay Colony granted a patent to John Winthrop, son of Governor Winthrop, with the "sole privilege of manufacturing salt after his particular method" for a term of 20 years. Massachusetts, Connecticut and Pennsylvania were the principal members of the 13 original colonies which granted patents. The Articles of Confederation, adopted 12 July 1776, contained no provision for the granting of patents, but the States issued patents independently as the colonies aforesaid had previously done. In 1785 James Rumsey obtained patents from the States of Maryland, Virginia, Pennsylvania and New York, for a new type of boat which during the previous year had had a trial on the Potomac River in the presence of George Washington.

The authority granted to Congress for the enactment of legislation affecting patents is derived from that article of the Constitution which empowers Congress to make laws which will promote the progress of the useful arts.

The first patent laws of the United States were enacted in 1790, and the person who had the honor of receiving the first patent issued by the United States was Samuel Hopkins of Vermont. The patent bore date of 31 July 1790, and was for a process of making pot and pearl ashes. If this early parchment is still in existence, the owner is a fortunate man, for the

document is certainly a historical curio. It possesses a special interest as it bears the signatures of George Washington, as President, Thomas Jefferson, Secretary of State, and Edmund Randolph, Attorney-General. All the early patents bore the signatures of the Presidents of the United States, were usually embossed on vellum in folio size and bore the great seal of the United States. Three patents were issued in 1790 and 55 in all under the act.

The attitude of the public and of the courts up to this time was antagonistic to patents as a rule. The old prejudice against monopolies still lingered in the minds of men, and the vast advantages to be gained by liberal laws as a stimulus to invention were not yet understood. If a question of right under a patent were brought up for trial, the presumption was generally against the claims of the inventor. As time passed, however, and a broader and more intelligent spirit prevailed, more favorable laws were enacted and a more generous interpretation of old laws crept in. Under the earlier dispensation the inventor was obliged to meet the enormous outlay that the securing of a patent demanded, or he kept his invention secret. The latter method has resulted in so many cases in what are known as lost arts.

The patent statutes received the serious attention of Congress in the late 30's and a number of acts were enacted, which placed the patent system on a substantial basis. The interest taken in the patent laws and the public demand for an extension of the system are evinced by the fact that new statutes were enacted in the years 1836, 1837, 1839 and 1842.

The present patent laws of the United States are those of 1870, at which time the preceding acts and parts of acts, numbering over 20, were consolidated and revised, and the former period of 14 years allowed to a patent was extended to 17 years. Revisions have been made from time to time, and the patent law as revised is issued in pamphlet form by the government for distribution to those interested.

What is a Patent?—The term *patent* or *letters patent* is derived from *litteræ patentes*, signifying that which is open or disclosed in contradiction to *lettre de caché*, that which is sealed or secret. Primarily the patent is to *make known* to the people the new invention and its uses and advantages; secondarily it confers upon the patentee for a stated period a monopoly of the manufacture, use and sale of the patented article. This term is the keynote of the whole principle upon which the patent system is built up, namely, disclosure. The disclosure must be honest, absolute and unreserved. The penalty for mental crookedness or for ignorance in giving out fully and freely the nature of the invention is severe and direct and is nothing less than forfeiture of the patent itself. The reason for this is perfectly logical and arises from the very meaning, spirit and nature of the relationship existing between the patentee and the government. The term of a patent is 17 years. The patent itself, however, is in the nature of a contract between the patentee and the government, presumably for their mutual benefit. The government grants to the inventor the exclusive right of manufacture and sale for 17 years on condition that the inventor shall disclose fully the nature of his invention or discovery, and shall allow the public the unre-

stricted use of the invention after this term has expired. If he fail in making full disclosure, he has not lived up to the terms of his implied contract and the contract thereby becomes null and void. It sometimes happens that an inventor discloses freely part of the invention, but cunningly conceals some essential step in the process, but if the case is tested within the courts and the real facts are brought to light, the patent will be declared invalid. An interesting instance in point is one which came to view in connection with the entry of the United States as a belligerent into the Great War. The United States followed the procedure of Great Britain and France as to German and Austrian patents, issuing licenses to American manufacturers through the Federal Trade Commission to work the patents in this country. When this was attempted it was found that in very many cases one of the essential steps in the processes patented had been omitted in order to preserve secrecy. This being a direct violation of the United States Patent Law, the incomplete patents were declared void. American manufacturers who discovered the missing links in the faulty descriptions were allowed to make application for patents under the complete descriptions, with the ultimate result that the original holders of the German patents are estopped from marketing in the United States the products thus patented without paying a royalty to the American holders of the complete patents. At the end of the term of 17 years the patent becomes public property, and the article may be freely manufactured by any one. It can never thereafter, as in so many cases in the Middle Ages, become a lost art.

Who May Obtain a Patent?—In order to secure a valid patent, the applicant must declare upon oath that he believes himself to be the true, original and first inventor or discoverer of the art, machine, manufacture, composition or improvement for which he solicits a patent; that he does not know and does not believe that the same was ever before known or used; and that the invention has not been in public use or on sale in the United States for more than two years before the application was filed, and that the invention has not been described in any printed publication for longer than two years prior to the filing of the application. Any one who can subscribe to the above conditions may apply for a patent, irrespective of race, color, age, or nationality. Minors and women and even convicts may apply for patents under our law. But it is provided that a lapse of a year between the filing of the application and its completion forfeits the patent—except in such cases as the commissioner may permit a longer time. The rights in an invention are not lost by death, for an application may be filed by the executor or administrator, and the rights of heirs thereby safeguarded. The patent in this case would issue to the executor or administrator and would become subject to the administration of the estate like any other property left by the deceased. Even the rights of an insane person may not be lost, as the application may be filed by his legal guardian. If foreign patents for the same invention have been previously issued, having been filed more than 12 months before the filing of the United States application, the patent would be refused. During the war a moratorium of nine months was allowed

by Congress beyond the 12 months prescribed in the law. The applicant must state his nationality. It often happens that two or more individuals have jointly worked upon the invention, and in this case the several inventors should jointly apply for the patent. Should they not so apply the patent when issued would be invalid. If they are merely partners, however, and not coinventors, they should not apply jointly for a patent, as the inventor alone is entitled to file the application. He may, however, assign a share in the patent to his partner, coupled with the request that the patent should issue to them jointly. It is of the greatest importance that these distinctions should be clearly understood; otherwise, the patent may be rendered invalid. Joint patentees may each exercise independently all rights conveyed by the patent without making any accounting to the other owners. Each may make, use and sell the invention on his own account and may issue licenses to others for his own personal benefit.

What May be Patented?—Any *new and useful* art, machine, manufacture or composition of matter, or any new and useful improvements upon an old, or already patented article. The patent for an improvement does not affect the earlier patent. A patent may also be allowed on a new combination of old appliances, upon new designs and upon new compounds for useful purposes. The thing invented must be *new and useful*. These are conditions precedent to the granting of a patent. Of these two conditions by far the more important is the former, and it is concerning the interpretation of this word "new" and its bearing upon the invention that the principal work and labor involved in passing an application safely through the Patent Office is involved. When the invention has been worked out by the inventor and he is prepared to file his application, his attorney prepares the necessary papers, as provided for by law, namely: An oath, a petition, a specification consisting of a description of the invention and concluding with claims which specifically set forth what the inventor claims to be the novel features of the invention, and drawings which are prepared and filed with the case, and in due course the application is ready for examination in the Patent Office. The question of whether the invention is *new* is then considered, and the burden of proof that the invention is not new rests upon the Patent Office. The examination consists in searching through the files of the Patent Office among the patents that have been already issued, and through such literature as may bear upon the subject. If any reference is discovered that anticipates the invention, as defined by the claims of the specification, the applicant is informed of the fact, and he is allowed to amend his papers and narrow the claims so as to avoid the prior patents, if possible. But no new material may be introduced in such amendment. If his attorney considers the position of the Patent Office untenable, he may present arguments to show wherein he believes that the inventor is entitled to a patent. It is thus seen that the question of whether an invention is new is one of fact, and one of the greatest importance, and upon the showing that the inventor is able to make during the prosecution of the case depends largely the future success of the patent. The evidence adduced in proving that the invention is not new must be tangible

and accessible. A patent would not be refused or overturned on a mere mental concept. There must be some evidence of a substantial character that serves to show that the earlier idea was reduced to practice or at least that there was such a description or drawing made, as would be sufficient for one skilled in the art to reduce the invention to practice. If it has not been actually reduced to practice, it must be a concrete not an abstract idea.

It is essential that the application for a patent should be filed before the invention has been in public use or on sale for a period of two years. If the inventor has publicly used or sold his invention for a period of two years, it becomes public property and he cannot regain the right to obtain a patent. He may, however, make models and experiment with his invention for a much longer period, provided he does not disclose his invention to the public or put it into actual use or on sale for a period of two years. The word "useful" is not one which usually gives either the Patent Office or the inventor a great deal of trouble, as any degree of utility, however insignificant, will serve to entitle the inventor to a patent. It has often happened that an invention which appears, at the time the patent is applied for, to have no special utility, in later years owing to new discoveries or improvements in the arts is found to possess the greatest merit and value. Unless an invention is positively meretricious, therefore, it is difficult to assume that it either has no utility or never will have any. Patents are granted for "any new and useful art, machine, manufacture or composition of matter, or any improvement thereon." It is seen from the terms of the statute that almost any creature of the inventive faculty of man becomes a proper subject for a patent. The exceptions are very few. Patents will not be granted, for example, for any invention that offends the law of nature. Under this category may be mentioned perpetual motion machines. In case an application of this character is presented, the commissioner politely informs the applicant that the matter cannot be considered until a working model demonstrating the principle of the invention has been deposited in the Patent Office. Inventions of an immoral nature will not be considered. Medicines and specifics are not now proper subjects for letters patent, unless some important new discovery is involved. Under a recent ruling of the Patent Office hundreds of patents were suspended lest they might prove to be an aid to the enemy in prosecuting the war, or a menace to public safety.

Patented Articles Must be Marked.—Articles manufactured and sold under a patent must be so marked that the public shall have notice that the article is a patented one. This notice consists of the word "Patented," together with the day and year when the patent was issued or the serial number of the patent. Damages in an infringement suit cannot be recovered unless the defendant has such notice on the article itself that it is patented. The term of a United States patent is 17 years. This term cannot be extended except by special act of Congress. It is many years since a bill seeking an extension of the term of a patent has been passed by Congress.

Appeals.—If an application for a patent has been rejected, the applicant may appeal from

the primary examiner to the board of examiners-in-chief. He may further carry the appeal to the Commissioner of Patents, and in case he is not satisfied with the latter decision, he may carry the appeal finally to the Court of Appeals of the District of Columbia.

Interference.—If two or more individuals shall have invented the same thing at or about the same time, interference proceedings may be instituted to determine which applicant is the original or first inventor. Interference proceedings are instituted between applicants whose applications are pending or between a pending application and a patent already issued, provided the latter patent has not been issued for more than two years prior to the filing of the conflicting application. The proceedings are conducted before an examiner of interferences. Appeal may be taken from the examiner of interferences to the board of examiners-in-chief, and from the board of examiners-in-chief to the Commissioner, and thence to the Court of Appeals of the District of Columbia. Not all the claims for a patent are necessarily involved, only such as cover the particular feature of the invention which is declared to be in interference. The unsuccessful applicant by eliminating the claims or claim in controversy may procure allowance of the other claims not objected to, and have the patent issued. In determining the question of priority of invention, witnesses are examined and the proceedings are conducted much in the same manner as in a suit at law. The first step in the proceeding consists in filing with the Commissioner a preliminary statement made under oath, giving the date at which the invention was first conceived and reduced to some tangible form, such as the making of drawings, the construction of a model or the disclosing of the invention to another. The object of the subsequent examination and cross-examination is to substantiate the date of invention as claimed by the applicants respectively, and to establish the priority of invention.

Infringement.—In case of an action for the infringement of a patent, the importance of the question of novelty appears from the special pleadings which the defendant may enter, which are as follows:

1. That for the purpose of deceiving the public the description and specification filed by the patentee in the Patent Office was made to contain less than the whole truth relative to his invention or discovery, or more than is necessary to produce the desired effect; or,

2. That he had surreptitiously or unjustly obtained the patent for that which was in fact invented by another, who was using reasonable diligence in adapting and perfecting the same; or,

3. That it had been patented or described in some printed publication prior to his supposed invention or discovery thereof; or,

4. That he was not the original and first inventor or discoverer of any material and substantial part of the thing patented; or,

5. That it has been in public use or on sale in this country for more than two years before his application for a patent, or had been abandoned to the public.

Damages for infringement of a patent may be recovered by action on the case in the name of the patentee or his assignee. The courts having jurisdiction over such cases have the

power—(1) To grant injunctions against the violation of any rights secured by the patent; (2) to allow the recovery of damages sustained by the complainant through such infringement. In such a case the defendant is compelled to furnish an accounting showing the amount of the articles manufactured and sold and the profits derived from such sale.

Design Patents.—Design patents are issued for any new or original design whether it be a work of art, statue, bas-relief, design for prints or fabrics, or for any new design or shape or ornament in any article of manufacture. The scope of the design patent was formerly very broad, but recent decisions and enactments have greatly restricted its availability and a design patent cannot now be obtained unless it possesses some inherent artistic quality. Mere utility is not sufficient to entitle a new design to letters patent. The terms of design patents are $3\frac{1}{2}$, 7 or 14 years.

Caveats.—The law providing for the filing of caveats was repealed by Congress in the year 1910.

Assignments.—A patent or any interest therein may be sold or assigned like any other piece of property. An inventor may sell or assign his interest or a part interest in his invention, either before the application is filed or while the application is still pending. Under these circumstances the patent may be issued to the assignee or to the inventor and assignee jointly. The patent if already issued may be assigned by the owner whether he be the inventor or an assignee. The conveyance is effected by an instrument in writing stating the conditions under which the patent is assigned, and the assignment should be recorded in the Patent Office.

FOREIGN PATENTS.

Canada, Dominion of.—The laws of Canada follow somewhat closely the practice in the United States. The term of a patent is 18 years. The general practice, however, is to divide the fees, making payment only for a term of six years at one time. The patent is subject to taxation after the first term of six years. Applications are subjected to examination as to novelty and usefulness, as in the United States. The application must be filed in Canada within one year of the date issue of the United States or other foreign patent. If the inventor neglects to file his application within the 12 months, the invention becomes public property. It is not permissible to import the patented article into the Dominion after 12 months from the date of the Canadian patent. Within two years from said date the manufacture and sale of the article under the patent must have been begun. These exactions may be relaxed under certain conditions. The Canadian government may also endorse any patent as subject to the grant of licenses.

Great Britain.—The term of the patent is 15 years. Under the Patent Act of 1902 which went into force on 1 Jan. 1905, a limited examination is made to ascertain whether the invention is novel. In the examination, the Patent Office officials refer to all British patents, the applications for which were filed during the 50 years immediately preceding the filing of the application which is being examined. This examination is not as thorough in its scope as

would at first appear, since publication in a foreign patent or in a periodical, while not preventing the grant of a British patent, may, in some cases, cause the British patent to be declared invalid by the courts. The application should, however, be filed before the invention is published in public print or becomes publicly known in Great Britain, except in cases where the application is filed under the provisions of the International Union. In Great Britain the true inventor should apply for the patent in his own name; but if the invention has been conceived in a foreign country, the first introducer may obtain the patent whether he be the true inventor or not. Under these circumstances, therefore, a foreign assignee may apply for the patent in his own name without the true inventor being made known. After the fourth year there are annual taxes, gradually increasing in amount. The patent should be worked in Great Britain within four years of the date of the patent, and is forfeited if work is suspended for one year. The 1918 Patent Bill contains a provision not heretofore compulsory, that the article patented must be made in Great Britain and declares the right of endorsing any patent as subject to the grant of licenses.

France.—The term of a patent is 15 years. There is no examination as to novelty and the patent is granted to the first applicant whether or not he be the true inventor. The patent must be worked in France within two years from the date of issue, and is subject to an annual tax. The life of the patent is conditioned on the payment of this tax and the grant is forfeited if work under it is suspended for two years. If these conditions are not complied with, the patent becomes public property, except when the patentee is a citizen or a subject of a country in the International Union, in which case the working should take place within three years of the filing of the application.

Germany.—The term of a patent is 15 years. The patent is issued to the first applicant, but if he is not the true inventor he should, before filing the application, obtain the written consent of the inventor. The application is subjected to a rigid examination. The patent is subject to an annual progressive tax and must be worked within a period of three years, but under a treaty it is not necessary for a United States citizen to work a patent in Germany provided the invention is worked in the United States.

Austria.—The term of a patent is 15 years. The practice is somewhat similar to the practice in Germany, although the examination is generally not so exacting. The patent is subject to an annual tax and it must be worked within a period of three years and is voided in case of a suspension of such work for one year.

Hungary.—The term of a patent is 15 years. The laws are similar to those of Germany.

Belgium.—The term of a patent is 20 years. The first applicant obtains the patent whether or not he is the true inventor. There is a small annual tax and the patent should be worked within one year of the working elsewhere. The patent expires if work under it ceases for one year.

Italy.—The term of a patent may be for one year, six years or 15 years. The patent is granted to the first applicant. The patent is subject to an annual tax and the working must take place within two years. The short term

patents are void if work under them ceases for one year, and the long term if the suspension is two years.

Russia.—The term of the patent is 15 years. The patent is subject to the payment of annual taxes and must be worked within five years. A suspension of work for two years voids the patent.

Spain.—The term of the patent is 20 years, subject to the payment of annual taxes. It must be worked within three years. The patent expires automatically if work under it ceases for one year. The patent is issued to the first applicant whether or not he be the true inventor.

Switzerland.—The term of the patent is 15 years, subject to an annual tax. Working must take place within three years, but in the case of citizens of the United States working in this country is accepted as fulfilling the requirements. Only the true inventor or his assignee can obtain a patent.

Norway.—Term of patent is 15 years, subject to a small annual tax. The patent must be worked within three years and becomes void in case of a suspension for one year. The application must be filed in the name of the true inventor or his legal representative. Application must be filed within six months of the publication of any prior patent.

Sweden.—Term of patent is 15 years, subject to payment of an annual tax. The conditions are very similar to the laws of Norway, but the application should be filed before the issuing of a prior foreign patent. There is no specified time within which work under the patent shall begin.

Denmark.—The laws are similar to those of Norway.

Portugal.—The term varies from one to 15 years, the fees payable depending upon the term of the patent. Under the longer terms the patent must be worked within two years, and is forfeited in case of a suspension for two years.

Holland.—Term of patent is 15 years, subject to annual taxes and compulsory licenses. Applicant presumed to be the inventor. Application should be filed before invention becomes publicly known. The application is examined before the issue of the patent. It must be worked within five years after issue.

Commonwealth of Australia.—Following the Act of Confederation in Australia the patent laws underwent an entire revision. The law now in force enables an inventor, under one application, to protect his invention in the six states forming the commonwealth. The states which have confederated forming the commonwealth are Victoria, New South Wales, Queensland, South Australia, Western Australia and Tasmania. New Zealand is not a member of the commonwealth. The inventor or his assignee should apply for the patent. The application should be filed before the invention is publicly used or published in Australia, though a publication made more than 50 years ago is not a bar to the grant, unless it is shown that the invention has been used in Australia within 50 years. The term of the patent is 14 years, a tax being due before the expiration of the seventh year. When a patent is not worked within two years, the patentee may be compelled to grant licenses on such terms as the court may deem just.

New Zealand.—The application should be filed before the invention becomes publicly known or is publicly used in New Zealand. The inventor or his assignee should apply for the patent. The term of the patent is 14 years, taxes being due after the fourth year and manufacture must begin in New Zealand within three years.

British India.—The patent is granted for 14 years and closely follows the British practice. Is subject to annual taxes after four years and to compulsory licenses. Must be worked within four years. Where the inventor is not a party to application, the application must contain a statement of his name. Application must be filed before the invention is known or used in India.

Porto Rico.—It is possible to procure protection for industrial property by registering a certified copy of the United States patent with the civil governor and complying with the other legal formalities. The term is 17 years and no taxes are assessed against the patent.

Philippines.—The *modus operandi* is the same as that just described as applying to Porto Rico.

Cuba.—Since Cuba has become an independent republic, it has established a patent system. The term of the patent is 17 years. Working should be established within one year. No taxes are levied against the patent.

Mexico.—The term is 20 years. No taxes are due after the issue of the patent.

South American Republics.—Patents are issued by all the South American republics. The principal countries in which patent protection is sought are Brazil, in which the laws are quite favorable to foreigners, Chile and Argentina. Patents are also frequently secured in Venezuela, Peru, Ecuador, Colombia and Paraguay, but only for certain classes of invention, owing to the expense involved in procuring the patents. In *Argentina* patents are issued for terms of five, 10 and 15 years and are subject to an annual tax. Work under the patent must begin within two years and a suspension of such work for two years renders the patent void. In *Bolivia* the life of a patent is 10 years, during which period it is free of tax. A deposit of \$150 is required as a guaranty that the patent shall be worked on Bolivian territory. In *Brasil* the life of the patent is 15 years, and an annual tax is levied. Manufacture under the patent must begin within three years, and a cessation of work under it for one year forfeits the grant. In *Chile* the patent runs for nine years and is free of tax. Manufacture under it must begin within two years and a cessation of two years renders it void. In *Colombia* the patent may run 10, 25 or 50 years, according to the character of the invention. It is free of tax for 10 years; must be worked within one year and is forfeited if work under it ceases for one year. In *Ecuador* the term of a patent is 10 years; no tax is levied; but work under the grant must begin within one year. In *Panama* patents are issued for terms of five, 10 or 15 years, and work under them must begin within 20 months for the short term and within five years for the long term. No tax is levied. In *Paraguay* the term is nine years, free of tax. There are no regulations as to when manufacture must begin. In *Peru* the life of the patent is 10 years, and it is free of

tax. Work under the grant must begin within two years of its date. In *Uruguay* the term of the patent is nine years, and it is subject to an annual tax. The term within which work under the grant must begin is stipulated in the patent, and it becomes void if the work is suspended for one year. In *Venezuela* patents are issued for terms of five, 10 or 15 years, and are free of tax. Work under the short term must begin within six months, and under the long term within two years.

South Africa.—Patents were formerly issued by each of the four important states, Cape Colony, Transvaal, Kongo Free State and Orange Free State. In 1916 the Parliament of the Union of South Africa passed a general patent law replacing the several provincial laws. The validity of former patents and trade marks is preserved. Protection is granted to foreign patents only in case of countries granting reciprocal rights to citizens of the Union.

Japan has recently enacted a system of patent laws on a liberal basis. The term is 15 years, and taxes are levied after three years. Failure to operate under the patent in three years renders it void.

China has no patent laws nor patent office.

The conditions under which foreigners may file applications in the countries having patent laws vary very greatly and no attempt has been made to specify under what conditions applications may be filed. In most countries, however, the issuance of a prior foreign patent will either defeat the issuance of the patent subsequently applied for in another country, or will render the patent invalid even if it is issued. Great care should be taken, therefore, to avoid having a foreign patent issue at such a time as to endanger the life of the patent at home.

International Union for the Protection of Industrial Property.—The members of the union are Great Britain, United States, France, Germany, Switzerland, Spain, Belgium, Italy, Netherlands, Denmark, Norway and Sweden, Portugal, Mexico, Serbia, Tunis, Brazil, Guatemala, San Domingo, Australia, New Zealand, Dutch East Indies, Dutch West Indies, Japan and Cuba, Austria-Hungary and Ceylon. The subjects or citizens of each of the contracting states shall enjoy, in all the other states of the union, so far as concerns patents for inventions, trade or commercial marks and the commercial name, the advantages that the respective laws thereof at present accord, or shall afterward accord, to subjects or citizens.

It is not possible in the short space allotted for this article to explain at length the various provisions of the treaty. Suffice it to say that one of the principal advantages gained by the union is the greater liberality shown to inventors and the extension of the term within which they may apply for patents in foreign countries. Under the provisions of the Industrial Union, patents which would be lost or rendered invalid by the premature issuance of a prior foreign patent may thus be saved. By examining the list given above, it will be observed that all the principal countries in the world have become members of the union with the exception of Russia and Canada.

The Patent System an Industrial Foster Parent.—Probably there can be no better way of estimating the debt which the country owes to the patent system than by considering the

growth of certain industries whose existence is dependent, either directly or derivatively, upon the patent laws. In the class of agricultural implements it is interesting to note that in 1850 the amount of capital engaged in this class of industry was only \$3,564,202. The growth has been startling and, continuous as will be seen from the fact that the capital in 1860 had increased to \$13,866,389. In 1914 it had increased to \$338,531,673, while the value of the products had increased from \$20,831,904 in 1860 to \$164,086,835 in 1914, giving employment to 48,459 wage-earners. It is also interesting to note that through the entire range of agricultural implements from the crudest implement to the most complicated machine, the evolution is dependent almost entirely upon the patented improvements which have produced newer and better articles and at the same time greatly cheapened the cost of production. In the class of sewing-machines the increase has been no less rapid. In 1860 the capital engaged in this class of enterprise was \$1,494,450; in 1914, the amount of capital had risen to \$34,467,000; whereas the value of the finished product had risen from \$4,403,206 to \$21,710,643. The automobile industry, founded largely upon the patent system, was represented in 1899 by 57 establishments employing 2,241 hands, and with a total invested capital of \$1,379,000. The yearly output was valued at \$1,253,000. In 1914 there were 300 establishments making automobiles and 971 making parts, besides 3,273 repair shops. They employed an aggregate of 152,039 hands; had a combined capital investment of \$312,876,000, and the yearly product was valued at \$503,230,000. The typewriter industry is almost entirely dependent upon patents, the increase being also striking. In 1890 there were 30 establishments, employing a capital of \$1,421,783, and producing a product of \$3,630,126; whereas in 1914, there were 107 establishments employing a capital of \$30,988,000, and producing a product of \$24,500,000. In electrical apparatus the inventions which have made possible the enormous growth of this industry have been almost entirely dependent upon patented inventions. In 1880 there were only 76 establishments and the capital employed amounted to \$1,509,758; in 1914 there were 1,030 establishments and the capital invested amounted to \$355,725,000, while the value of the product had increased from \$2,655,036 to \$335,170,000. The first phonographs and graphophones were produced in 1877. The annual products from this industry in 1914 amounted to \$27,116,000. There are over 150 establishments engaged in the manufacture of photographic materials and apparatus. In 1899 there were only 11 establishments, with a total invested capital of \$3,348,000, and a yearly product valued at \$2,072,000. In 1914 the capital of these establishments amounted to \$33,771,000, and the annual product amounts to \$39,041,000. Many chemical processes are dependent entirely upon patents. Over \$43,000,000 are engaged in the manufacture of glucose, yielding products to the value of over \$52,615,000. The wood pulp industry is one which is dependent for its existence upon the patent system. It originated with the wood pulp patent of Volter in 1858, following with the soda fibre and sulphite fibre processes, and now shows a capital investment of \$36,028,000 with annual

products valued at \$20,526,000. To Charles Goodyear is due the great impulse given to the rubber industry, owing to the introduction by him of the process of vulcanization. The amount of rubber and elastic goods and rubber boots and shoes now manufactured amounts to \$300,994,000. The wonderful improvements which have been made in the iron and steel industry have originated in almost every case from patented inventions. In 1914 the number of blast furnaces, rolling mills, forges and bloomeries comprised 567 establishments, with a capital of \$1,720,653,000, employing 278,072 wage-earners, who receive in wages \$210,923,000; with products to the value of \$1,236,319,000. The records of the printing industry are full of interest, owing to the number of establishments of which there is a record in the United States, amounting to 31,612. The capital employed amounts to \$632,027,000, and the amount of products \$803,237,000. It is safe to say that almost every article which the printer touches owes its origin to some patented device or apparatus.

The growth of the Patent System is also well illustrated by noting the increase in the number of patents issued from year to year. Between 1790 and 28 July 1836, only 9,957 patents had been issued. Between the years 1836 and 1850, 6,980 were issued, making a total of 16,937 up to 1850. During the year 1850, 884 patents were issued; during the years 1905-06, 31,837 patents were issued, and during 1911 the total number of patents issued reached the million mark. In 1918 the number of patents issued was 38,569, the serial number of the last issued in that year being 1,290,026.

The Patent Office.—The Patent Office is not an independent department of the government, but is a branch of the Department of the Interior. The Patent Office force consists of the Commissioner of Patents, about 400 examiners, including 45 principal examiners, two examiners of interferences, three examiners-in-chief, besides assistant examiners of various grades. The entire force of the Patent Office, including clerks, stenographers, messengers, etc., amounts to 800 persons. The year's work in the Patent Office comprises the comparing of some 70,000 applications with the patents previously allowed—about 1,300,000. This is an amount of business double that of any other patent office in the world, and 30 per cent more than for the whole British Empire together. The average time of prosecution of a patent is 21 months, but many take longer, and there is a considerable number which have been pending for five years, and some which have been under consideration for 15 years. The department is housed within the Patent Office building at Washington. The quarters, formerly cramped and inadequate, have been enlarged by the withdrawal of the Department of the Interior to its own building. The fact that more modern and commodious quarters are not allotted to the Patent Office is due to no lack of funds on the part of the patent department, which is a paying institution. The business of the office shows a profit during the fiscal year ending 30 June 1910, of \$19,824.75; this being the total excess of receipts over expenses for the fiscal year. The balance in the United States treasury due to the Patent Office amounted on 1 Jan. 1918 to \$8,219,071.35. The

surplus usually amounts to over \$200,000, but the Patent Office is not allowed to make use of this sum, as it can only use the amount of funds provided by Congress for the running expenses of the office, amounting to about \$2,000,000 annually. The appropriation is often inadequate, and the work of the office is thus hampered by lack of funds. It is to be hoped that at some future time the large fund now deposited in the United States treasury to the credit of the Patent Office may be used in the erection of a modern building designed especially to perfect and facilitate the work of this most important department of the government.

PATER, pā'tér, Walter Horatio, English essayist: b. London, 4 Aug. 1839; d. Oxford, 30 July 1894. He was educated at King's School, Canterbury (which he describes most exquisitely in his "imaginary portrait" of 'Emerald Uthwart') and Queen's College, Oxford, and in 1864 became a Fellow of Brasenose College. He had at first intended to take orders in the Church of England, and then, as his views changed, had thought of becoming a Unitarian minister, but in 1864 he had abandoned both projects, and while perhaps not entirely abandoning belief in Christianity came to regard religious themes from a standpoint almost purely philosophical. Out of the strong religious tendencies of his youthful days grew his later desire to interpret to his age the spirit of that of the past, and more especially of the Renaissance in literature and in art. His first published work was 'The Renaissance: Studies in Art and Poetry' (1873), which brought him a select if not a wide circle of enthusiastic admirers. It was followed by 'Marius the Epicurean: his Sensations and Ideas' (1885), a highly subjective study of the mental history of a Roman youth represented as living in the time of Marcus Aurelius. These two works exhibit to the full their author's peculiar characteristics of style, the most precise statement of thoughts and impressions, the utmost delicacy and refinement and rhythm whose charm is rarely surpassed, a subtlety that perplexes and obscures at times, and a serious want of vigor. While 'Marius' remains, perhaps, his greatest achievement, his 'Imaginary Portraits' (1887) is his most thoroughly delightful work. In the same vein as the four stories in this latter volume are 'The Child in the House' (1894) and the 'Esmerald Uthwart' and 'Apollo in Picardy' included in

the 'Miscellaneous Studies' (1895). His other volumes comprise 'Appreciations' (1889); 'Plato and Platonism' (1893); 'Gaston de La-tour,' an unfinished romance (1897); 'Greek Studies' (1897). Pater's style is peculiarly his own and represents the extreme limit of ultra-refinement attained in English prose in the 19th century. It does not stimulate, it is true, but its charm is very great. (See MARIUS THE EPICURAEAN). Consult Greenslet, 'Walter Pater' (1903).

PATERCULUS, pā-tēr'kū-lūs, **Gaius Vel-leius**, Roman historian: b. Campania about 19 B.C.; d. after 31 A.D. His reputation as a his-torian rests chiefly upon his 'Historiæ Romanæ' (in two books, Basel 1520), which purports to be a universal history though really dealing chiefly with that of Rome. There have been many editions of the work, among them Bur-mann's (1719); Ruhnken's (1779); Orelli's (1835); Kritz (Leipzig 1840); Halm's (1876); Rockwood (Boston 1893). Consult Teuffel, W., S., 'Geschichte der Römischen Literatur' (Vol. II, Leipzig 1910).

PATERNOSTER, pā-tēr-nōs'tēr, the open-ing words of the Latin version of the Lord's Prayer (q.v.).

PATERSON, Andrew Barton, Australian poet and journalist: b. Narrambla, New South Wales, 17 Feb. 1864. He studied law and finally turned to journalism in 1886; and ultimately became editor of the *Town and Country Journal*, Sydney. He writes under the pen name of "Banjo." As a special war cor-respondent for Reuters Agency, the *Sydney Morn-ing Herald* and the *Melbourne Argus*, he went through the South African War and visited the Philippines, China and the New Hebrides for the *Herald*. In 1902 he wrote special arti-cles on the Australian labor question for the *London Times* and he was editor of the *Sydney Evening News* (1903-06). Among his published works are 'The Man from Snowy River,' a volume of stirring narrative verse of which 32,000 copies were sold within a short time after publication; 'Rio Grande's Last Race and other Verse'; and 'Old Bush Songs.' He has also published a successful novel, 'An Outback Marriage.'

PATERSON, John, American soldier: b. New Britain, Conn., 1744; d. Lisle (now Whit-ney's Point), N. Y., 19 July 1808. He was graduated from Yale in 1762 and he engaged in law practice at New Britain; but in 1774 he removed to Lenox, Mass., where he continued his practice, and in that year was elected a member of the Provincial Congress. In 1775, after the battle of Lexington, he joined the Federal Army. Under his supervision the first redoubt at Boston was constructed, and he de-fended it with his men at the battle of Bunker Hill. He served in Canada and later under Washington in New Jersey, participating in the battles of Trenton and Princeton. In 1777 he was made brigadier-general. In the battle of Stillwater and at the defeat of Burgoyne he performed distinguished service, and later he was as the battle of Monmouth. He was mustered out of service as major-general in 1783 and subsequently joined the militia during Shay's Rebellion in 1786. In 1794 he removed to Lisle, N. Y., and afterward served four

terms in the legislature. He was the first pre-siding judge of Broome County, N. Y., and a member of Congress in 1803-05, after which he lived in retirement.

PATERSON, John, American mathema-tician and actuary: b. near Morristown, N. J., 1801; d. Albany, N. Y., 1883. After the early death of his father at Hamilton, Canada, he pursued his education while learning the print-ing trade at Buffalo. Having completed his apprenticeship, he found his way to Albany, N. Y., in 1823 and shortly after his arrival became associated with the Van Benthuyzen Company, State printers. Meanwhile his apti-tude for mathematics and the sciences led him to study the languages, ancient and modern. He was honored in 1833 with election to the Albany Institute and in 1835 with the master's degree from Union College. He declined an appointment to the Smithsonian Institution and other preferment, and was engaged for some years in the press corrections of the monu-mental 'Natural History of New York.' In 1851 he became State superintendent of weights and measures, and at the erection of the State insurance department in 1860 became its mathe-matician and then its actuary, retiring in 1874. His only son, JOHN SHERMAN PAT-ERSON, b. 1849; d. Albany, N. Y., 1917, in-herited his mathematical ability and served the actuarial bureau of the New York In-surance department for 50 years, 35 of which he was head of the bureau and supervised an astonishing development of insurance and ex-pansion in many new lines. He was member and Fellow of the Actuarial Society of America from its foundation in 1889. He revised and extended the tables of policy valuation con-structed by his father and which are in gen-eral use.

PATERSON, Robert, Scottish stonemason, immortalized by Scott as "Old Mortality": b. near Hawick, Scotland, 1715; d. Bankend, England, 29 Jan. 1801. He served his ap-prenticeship as a stonemason with his brother near Lochlaben, and in about 1740 married and rented a quarry, making a business of carrying gravestones to Galloway. His house was burned, and he was taken prisoner on the re-treat of Prince Charles in 1745 because, it is said, of the fact that he was a Cameronian. While in England he became so interested in restoring and erecting headstones on the graves of the Covenanting martyrs that when released he remained with his family only a short time, and in 1758 deserted them, devoting the re-mainder of his life to the "unusual business of his pilgrimage." The story as told to Scott by Joseph Train became the foundation of the novel, 'Old Mortality.'

PATERSON, William, English financier, founder of the Bank of England: b. Skipmyre, Dumfriesshire, April 1658; d. London, January 1719. He was brought up in England, may have been a peddler in his early days, but soon be-came a well-to-do merchant, and at 23 a member of the Merchant Taylors Company. He took part in planning the revolution of 1688; as early as 1691 proposed the formation of the Bank of England and in 1694 became one of its direct-ors. In 1695 he attempted to carry out a long cherished scheme of a free commonwealth and

emporium of trade in Darien; the colony was entirely unsuccessful, and Paterson for a time lost his reason. On his return to Great Britain he promoted the Walpole Sinking Fund, the scheme of 1717 for the conversion of the national debt, and the Union of Scotland and England. Paterson wrote several pamphlets on economic and political questions. Consult the 'Life' by Bannister (1858).

PATERSON, William, American jurist: b. at sea 1745; d. Albany, N. Y., 8 Sept. 1806. He was brought to America by his parents when a child, was graduated from Princeton in 1763, admitted to the bar in 1769 and engaged in practice in New Jersey. In 1776 he was a delegate to the New Jersey State constitutional convention and was appointed attorney-general of the State in that year, which office he held for 10 years. He was a delegate to the Continental Congress in 1780-81, and in 1787 a member of the National constitutional convention, where he proposed the "New Jersey plan," which was to leave in the hands of the "sovereign States" practically all laws excepting those concerned with regulating commerce, levying duties and providing the means of war. There was to be one legislature in which each State should have one vote, and all executive and judiciary committees were to be removable by Congress. This plan was opposed by Edmund Randolph, who presented the plan for a national government, and ultimately the two plans were merged in one and adopted. He was United States Senator from New Jersey 1789-90, governor of New Jersey 1791-93, and was appointed by Washington associate justice of the Supreme Court in 1793. The city of Paterson, N. J., was named in his honor. His letters have been published and edited by Mills, under the title of 'Glimpses of Colonial Society and the Life of Princeton College 1766-73, by One of the Class of 1763' (Philadelphia 1903).

PATERSON, William, Canadian statesman: b. Hamilton, Ontario, 19 Sept. 1839. He early entered business life, in which he was markedly successful. He was mayor of Brantford in 1872-73, and a member of the Canadian House of Commons in 1872-1911. He entered the Laurier Cabinet as Comptroller of the Customs in 1896, and was appointed Minister of Customs of Canada in 1897, which office he occupied until 1911. He was actively connected with the framing of the new customs tariffs of 1897 and 1907; and in 1911 was one of the Canadian representatives conducting reciprocity negotiations at Washington, D. C.

PATERSON, William Romaine, (pseud. BENJAMIN SWIFT), British novelist: b. Glasgow, 29 July 1871. He was educated at Lausanne and at Glasgow University afterward traveling in Europe for the purpose of acquiring foreign languages. Author of 'Nancy Noon' (1896); 'Siren City' (1899); 'Sordon' (1902); 'The Nemesis of the Nations' (1907); 'The Old Dance Master' (1911); 'The Lady of the Night' (1913); 'What Lies Beneath' (1917), etc.

PATERSON, N. J., industrial city, the third in population in the State and the capital of Passaic County, situated 17 miles northwest of New York City, on the Passaic River, which for several miles, on the east and north, forms the

boundary line of the municipality. The city is built chiefly on a plain surrounded on the north and west by high hills. A portion of the town, however, is situated on the hills rising from the north bank of the river and on the high ground around the point where the river descends to the level of the plain over the Passaic Falls. The descent is about 70 feet; the perpendicular fall being some 50 feet. In the abundant power afforded by this waterfall is seen the reason for founding the city at this point, and its growth to one of the most important manufacturing centres of the country.

Population.—The United States census of 1910 gave the population as 125,600 of whom 45,398 were foreign born. By 1920 the number of inhabitants of the city, according to the figures supplied by the United States Census Bureau, had increased to 135,866.

Transportation.—Three important railway lines pass through Paterson: the Erie; the Delaware, Lackawanna and Western, and the New York, Susquehanna and Western. Electric street railroads radiate from the city in every direction. The "Hudson River Line" runs directly across country to the 131st street ferry, New York City. It is expected that long-continued efforts will soon result in inducing the United States government to do the work necessary to open the Passaic River to navigation to Paterson from Passaic, four or five miles below, thus increasing freight facilities for the great manufacturing interests of Paterson.

Industries.—Paterson is called "The Lyons of America" because it is the principal silk manufacturing centre of the Western hemisphere. Condensed statistics of manufactures in Paterson, received from the New Jersey Bureau of Industrial Statistics, for the year 1918, give 308 as the "number of establishments" engaged in the manufacture of silk, including dyeing and finishing. This figure would appear not to include all of the smaller firms doing business with a few looms in rented quarters, for Davison's Silk Trade Directory for 1919 lists over 600 firms in Paterson, including those in two or three small suburbs just beyond the municipal boundary. The following figures are from the Bureau of Industrial Statistics and are for silk manufacture in Paterson for the year 1918; Capital invested, \$59,996,849; value of goods made, \$115,174,778; persons employed, 26,897; wages paid, \$21,014,434. In addition to the above there were 16 establishments engaged in the manufacture of silk mill supplies, having a combined capital of \$847,475, making goods to the value of \$1,418,944 and paying \$414,776 in wages to 664 employees. Other industries, each having a capitalization of more than a million dollars are, machinery, 14 establishments, total capital, \$3,938,415, value of product, \$7,320,547, wages, \$1,940,660 paid to 1,913 persons. Under this heading is included the manufacture of locomotives, now relatively a somewhat less important branch of Paterson industries than in earlier years, though more than half the men (1,913) mentioned above worked in the one great locomotive shop; four brass foundries, total capital, \$2,799,713, goods produced, \$2,462,985, wages, \$832,723, paid to 865 persons; three establishments producing textile goods other than silk, capital, \$1,966,905, value of

product, \$1,859,486, wages amounting to \$346,918 paid to 552 employees; shirts, eight factories with total capital of \$1,479,800 and annual product valued at \$3,970,614, paying wages amounting to \$927,713 to 1,526 employees; structural steel and iron, five mills with total capital of \$1,147,968, producing goods valued at \$1,121,381, paying \$271,524 to 275 workers. There are other minor manufacturing industries, whose capital and annual product in nearly every case amounts to hundreds of thousands of dollars. Among them are pipe works, steam boilers (not included in above enumeration), paper boxes, clothing, etc. During the World War the production of munitions in Paterson was of considerable importance. The New Jersey Bureau of Industrial Statistics gives the following figures for the manufacturing industries of Paterson, during the year 1918: capital invested: land and buildings, \$13,199,385; machinery and tools, \$23,878,937; bills receivable; stock in process of manufacture, cash in hand, \$53,591,324; total, \$90,669,646; value of materials used, \$94,355,677; value of goods made, \$164,486,162; total amount paid in wages \$31,619,406; average number of persons employed: males, 23,834; females, 14,550; children, 14-16 years of age, 1,096; total, 39,480.

Banks.—Paterson has three national banks whose combined resources aggregate \$21,500,000. There are six savings banks and trust companies with total resources of \$53,414,731. The oldest of these, the Paterson Savings Institution, now in its 51st year, has resources amounting to \$18,449,093 and deposits to the amount of \$17,500,000.

City Government.—The city government comprises a mayor, elected for two years; board of finance; board of public works; board of fire and police commissioners; commissioners of public instruction; free public library trustees; board of park commissioners; board of health; commissioners of assessment of taxes, and a board of 11 aldermen, whose authority extends only over excise matters. The commissioners are appointed by the mayor.

The total valuation for taxation in 1919 was \$119,000,679, and the budget, or total, raised by taxation was \$3,329,985.

Area, Streets, Parks, Cemeteries.—There are within the corporate limits of Paterson 5,357 acres or 8 36/100 square miles. The streets are paved about as follows: Asphalt, 7.52 miles; asphaltic macadam, .98 miles; brick, 7.79 miles; granite, palisade and trap rock block, 7.56 miles; wood block, 4.42 miles; macadam, about 60 miles. Paterson has three parks of moderate area, but well kept, presenting pleasing examples of landscape gardening and affording somewhat exceptionally picturesque and charming distant views. Two of the parks are situated one at either end of the town and both border on the Passaic River. The East-side Park contains 60 acres and the Westside 30 acres. The newer Sandy Hill Park is on high ground not very far from the centre of the city. There are also 23 small parks scattered throughout the city. Situated one at the east, the other at the west side of the town, are two cemeteries, beautifully laid out. In Cedar Lawn Cemetery is the costly mausoleum of the late Hon. Garret A. Hobart, Vice-President of the United States.

Public Buildings.—The city contains a considerable number of handsome buildings. The most important in the business section are the city hall (Carere and Hastings, architects), and on the square surrounding it, or within one block from it, seven modern and costly bank buildings, several large office buildings, The Hamilton Club—one of the finest club houses in New Jersey—the Elks' club house, the Young Men's Christian Association and the Young Women's Christian Association. Main street contains large and handsome department stores of metropolitan character and appointments. The county courthouse is a costly structure built of white marble. Adjoining the courthouse is the post office, of Flemish architecture, and opposite, the high school, costing almost a million dollars. The most notable churches are the church of the Redeemer, Presbyterian, Saint Paul's Protestant Episcopal, Saint John's Roman Catholic, Saint Joseph's Roman Catholic and the Second Presbyterian. The Danforth Memorial Library building is one of the most notable and beautiful public buildings in the city. It was erected in 1903-04 as a memorial to the late Charles Danforth, with funds presented to the public library trustees by his daughter, the late Mrs. Mary E. Ryle, the cost of the building and grounds being upward of a quarter of a million dollars.

Education.—The efficient and progressive public school system includes 27 schools. The number of pupils is 23,000 and the number of teachers 744. The large and costly high school building, erected a few years since, is already too small to accommodate the rapidly increasing number of students and a second very large building has been provided for, construction of which will begin in 1919 or 1920. The school system includes normal training, manual training and "disciplinary" schools. The appropriation for the department of public instruction in 1919 was \$1,040,741 and of this sum \$672,165 was for salaries of teachers. There are several large parochial schools in Paterson and two or three private schools of good standing.

Libraries.—The Free Public Library system consists of the main library in the Danforth Memorial building, four branches in different sections of the town, each in rented quarters, and a small branch in the Young Women's Christian Association. The library building and most of the books were destroyed by fire in 1902. The present Danforth Library building was completed in 1905. The main library and branches together contain 76,377 volumes and the collections are steadily growing and very extensively used by the people.

Newspapers.—Three daily newspapers are published in Paterson and five weekly, two of which are in Dutch and two in Italian.

Religion.—There are nearly 100 churches in Paterson representing all the principal Christian denominations. There are also several Jewish synagogues. There are a flourishing Y. M. C. A. and Y. W. C. A., each with a handsome building.

Charities.—There are three large and well-supported hospitals—the General Hospital, Saint Joseph's and Miriam Barnert Memorial Hospital—also an isolation hospital for contagious diseases. There are two orphan asy-

lums, an Old Ladies' Home and a Children's Day Nursery with a building erected, as a memorial to her daughter, by Mrs. Garret A. Hobart. Various smaller charities receive liberal support from the community.

History.—The town of Paterson was founded by, or had its origin in, the "Society for Establishing Useful Manufactures" (the S. U. M.), which was chartered by the legislature of New Jersey in 1791, and in the summer of 1792 the site, by the "Great Falls of the Passaic," was fixed upon as the location for the mills and the town. The charter of the society was drawn up by Alexander Hamilton, then Secretary of the Treasury, who was greatly interested in founding a system of American manufactures. He has often been considered the founder of Paterson (which explains the presence of his statue in front of the city hall) and there seems to be little doubt that he was the chief inspiring and perhaps dominating personality in the founding and the first year or two of the history of the S. U. M. and that he influenced the newly-formed corporation in selecting the site for the town, but "there is little evidence of any active interest on his part after the middle of 1793." William Paterson, in whose honor the town was named, was governor of New Jersey at the time and signed the act of incorporation.

Cotton manufactures were the first and for many years the most important carried on, but have long since been superseded. Woolen and paper manufactures were also extensively carried on in the early and middle part of the last century, and it was here that Samuel Colt manufactured the first of his revolving pistols. His venture in Paterson, however, was not a success. The first locomotive manufactured in Paterson was finished in 1837, after six months' labor upon it. It was not until 1840 that the silk industry was successfully established by John Ryle, a young Englishman. At midnight on Saturday, 8 Feb. 1902, a fire broke out in the lower part of the city and rapidly burned its way through the heart of the business section of the town. Two bank buildings, the public library, five churches, some of the largest stores and other prominent buildings and about 250 dwellings were destroyed. The scene was one of great desolation and the loss many millions of dollars, the citizens raised a large fund for the relief of the destitute and immediately set to work to build the city far better than before. In less than a month another calamity came, the greatest flood ever known in the Passaic Valley. Great loss of property followed in Paterson, and hundreds of the poorer class were again driven from their homes. In October 1903 another great flood occurred, causing heavy loss.

In 1902 there was a prolonged strike of silk workers with much disorder. Again in 1913 occurred a bitterly contested silk-workers' strike, some 23,000 employees remaining idle for nearly five months, and losing in wages about \$5,250,000. Later labor troubles have been adjusted by arbitration and industrial peace seems to be in a fair way of attainment.

In the World War, Paterson took an honorable part, sending its full quota of men, over-subscribing four out of five Liberty Loans, doing a great Red Cross work, sending through its public library between 15,000 and 20,000

books and several tons of periodicals to the soldiers and in all ways meeting the demands of loyalty and patriotism.

Bibliography.—The late William Nelson of Paterson, long secretary of the New Jersey Historical Society, left unfinished a very extensive and elaborate 'History of Paterson.' This work, in three volumes, completed by Charles A. Shriner, is in course of publication in 1919. Consult also Clayton and Nelson, 'History of Passaic and Bergen Counties, New Jersey' (Philadelphia 1882; chapters on the city of Paterson by William Nelson); Davis, J. S., 'Earlier History of American Corporations' (Harvard University Press, 1917, Vol. I of this book, pp. 349-522, contains the most elaborate and scholarly study of the S. U. M. and the founding of Paterson that has been published); Shriner, C. A., 'Paterson, N. J., for Manufacturing and Residence' (published under auspices of the Board of Trade, Paterson 1890); Trumbull, L. R., 'History of Industrial Paterson' (Paterson 1882).

GEORGE F. WINCHESTER,
Librarian, Free Public Library.

PATHE, pa'tā, Charles, French photographer and pioneer in the motion picture trade: b. Paris, about 1873. In 1896, in conjunction with his brother Emile, and two others, he founded the now well-known firm of Pathé Frères. The firm started with two kinetoscopes, in which by dropping a coin, one was privileged to see a succession of tiny photos tumbling over one another and giving the effect of life action. The machine had been invented by Edison in America and copied in England by Robert Paul, who delivered the machines to Pathé. The firm members had each contributed less than \$500 and after a time two withdrew, leaving the Pathé brothers to carry on the business alone. It was soon found necessary to change the kinetoscope pictures frequently. Charles purchased 20 additional machines, placed them in 20 different towns and switched the pictures in weekly rotation. Thus was born the first picture exchange on 6 June 1894. C. Francis Jenkins projected pictures from moving celluloid film on the wall of a jewelry store at Richmond, Ind., Not until two years later did his invention attract general attention. Pathé meanwhile, had secured Lumière's motion picture camera, then just completed, and began to take his own pictures 10 or 15 feet at a time. His projection apparatus was still imperfect; for a time he was his own cameraman, shipping clerk, manufacturer, salesman and demonstrator. Later with the development of improved projection apparatus in America the Pathé firm entered on the production of photoplays. The one-room factory of 20 years ago is represented by a \$2,800,000 concern in Joinville, France, with branches in England and the United States, and offices and exchanges in all parts of the world. The Pathé news film is familiar to all patrons of the cinema. The French government has made M. Charles Pathé a chevalier of the Legion of Honor.

PATHELIN, pa'tlān', Maistre Pierre, marks the beginning of French comedy with a work still admired for its comic force and resourceful exploitation of dramatic possibilities. Authorship and date are not established, but the original Pathelin farce, 'Maistre Pierre

Pathelin' was probably written and first acted between 1467 and 1470, and many signs point to the lawyer, ecclesiastic and poet Pierre Blanchet of Poitiers (1459-1519) as its author. Its immediate popularity is indicated by imitations, 'Le Nouveau Pathelin' of 1474 and 'Le Testament de Pathelin' of about 1485, and also by familiar allusions in the works of Villon, Coquillart, Gringoire and others. It penetrated to England and to Germany, was turned into Latin by Reuchlin as 'Scenica progymnastica' and was acted by his pupils at Heidelberg (1497). A more faithful Latin version by Connibert, 'Patelinus alias veterator, nova comedia,' appeared in Paris in 1512. The French play was printed with gradual modernizations 25 times before the end of the 16th century and twice in the 17th. In 1706 Brueys used the plot for his 'L'Avocat Pathelin,' and the old play, though commended by Molière and La Fontaine, suffered passing neglect. It was twice printed in its early form in the 18th and often in the 19th century, most elaborately by Genin (1854), most conveniently with its companion pieces by Jacob in 'Recueil des Farces' (1876). The farce tells in lilting octosyllabic couplets how Pathelin, a lawyer, buys cloth with no intention of paying for it, tricks the merchant, but is himself tricked by a shepherd client who uses the stupidity which Pathelin had taught him to feign, to defraud the counselor of his fee. There is a prose translation, with introduction and stage directions, by R. Holbrook, Boston, 1905 and 1914.

PATHFINDER, a nickname given Gen. John C. Frémont (q.v.) because of his explorations of the Far West from 1837 to 1853.

PATHFINDER, The. 'The Pathfinder; or the Inland Sea,' third in the order of events of Fenimore Cooper's Leather-Stocking tales, was published in 1840, 13 years after Natty Bumppo had ended his career in 'The Prairie.' Although Cooper had questioned the wisdom of reviving that hero, and although he was at the time engaged in fierce litigations with the newspapers, he brought to his task the remarkable freshness and vigor with which he always handled the fortunes of his chief character. It is true that 'The Pathfinder' shows Natty at his old trick of guiding tender damsels through the dangerous woods, and that the siege at the blockhouse and the storm on Ontario are considerably like other of Cooper's sieges and storms. The book suffers little, however, from these parallelisms. Chingachgook has all his proud, affecting, forest stoicism and competence. Natty, here commonly called La Longue Carabine, keeps in a hardy middle age his simple and honest nature, which is severely tested by his love for a young girl. She is a conventional heroine of romance who would not have deserved Natty had she loved him. But a certain soft amiability about her turns for a time, and convincingly enough, all the thoughts of the scout to the world of domestic affections. More talkative than ever before, he reveals new mental and moral traits. With the same touch of realism which had kept Uncas and Cora apart in 'The Last of the Mohicans,' Cooper separates these lovers, not, of course, without certain fine gestures of renunciation which have the due romantic flavor, sends her to the arms of a younger suitor, and restores

the hero to his true home in the wilderness. The adventures of the plot are varied and stirring, particularly those on the water, which take authority from the fact that Cooper had as midshipman actually seen service on Lake Ontario. In language, method, ideas 'The Pathfinder' resembles the rest of the series, but it is a real distinction to be the only book which shows Natty Bumppo in love and the first which made important imaginative use of the Great Lakes.

PATHOLOGY (Gr. *πάθος*, suffering and *λογία*, doctrine of disease) is the science which treats of all departures from the normal condition of the animal or plant. Owing to the great range of variation in the anatomy and functional behavior of organs and tissues, it is difficult to set up a standard which may be considered as normal, and we are forced to adopt for this purpose the usual or average condition. Pathology treats of all abnormalities in the process of development of the individual and of their results. It considers all the untoward results of outward influences, be they physical or chemical, or of those more complex influences which we may designate biological, as well as those subtle characters of the organism itself which, often hereditary, render it more or less prone to these influences, and give it the power of arranging a protection for itself and recovering its normal state.

Historical.—Within recent centuries the various subdivisions of pathology have acquired such importance and have been so systematically studied as to constitute almost independent sciences. The science of pathological anatomy, for example, is a development of the last 300 years, while that of pathological chemistry dates only from the middle third of the 19th century. Pathology in its broad sense, however, must be recognized as existing, though in a crude and imperfect form, even in the very beginnings of science. Throughout the history of medicine the student must observe the distinction between the products of objective investigations—the direct observation of nature—and the ever-recurring philosophical or speculative systems of medicine built upon some fanciful or arbitrary foundation and rounded off with apparent logic to satisfy the innate cravings of man for order and completeness. To the former is due the real and steady progress of medicine, while only too often the systems based on speculation have retarded progress. Observation and hypothesis are, however, so mixed together and entangled that it is not possible to consider one without the other.

The earliest beginnings of pathology are to be found in the writings of the Hindus, Chaldeans, Chinese and Egyptians, where, although medicine was under the sway of priests, and incantations were the main therapeutic agencies, there can still be recognized a vague knowledge of the more obvious diseases. In Greece the records contain only similarly obscure conceptions until about 400 B.C., when there arose the Hippocratic school, of which the most important writings are attributed to Hippocrates himself. The great services of this school lay in their separating medicine from religion, in making abundant accurate observations on the symptoms and course of diseases, and in instituting a rational hygienic and dietetic system

in the treatment of disease. The pathology of Hippocrates was a humoral pathology with only the most meagre basis of anatomy or physiology, inasmuch as human dissections were not practised. The next advances were made by the Greeks in Alexandria, where the study of anatomy flourished under Herophilus and Erasistratus about 300 B.C. In Rome, Celsus, Aretæus, and above all, Galen, who lived in the latter half of the 2d century, contributed not only to the knowledge of disease, but also to that of anatomy and physiology; and Galen, adopting and expanding the Hippocratic teachings, so welded together the knowledge of the times, filling the gaps by ingenious speculation, that his system, treating of the whole realm of medicine, became supreme in its apparent infallibility, and dominated medical thought and practice until the 16th century. During all this time no important advance was made, the literature consisting largely of compilations and translations, preserved and transmitted to western Europe by the Arabs, all difficulties being decided by a reference to the authority of Galen. With the revival of learning and the introduction of the practice of dissecting the human body there arose those great medical reformers, Vesalius and Paracelsus, who pointed out errors in Galen's system. The former overthrew his supremacy so far as it referred to anatomy, and the latter endeavored to break the shackles of all authority and tradition. In the 17th century Harvey by his discovery of the circulation of the blood completed this overthrow from the physiological side. These men, however, formed no satisfactory substitutes for the universal authority in medicine of Galen, and to satisfy this craving numerous more or less fanciful systems arose in the 17th and 18th centuries, which were concerned mainly with the nature of the processes of life, and made sweeping generalizations as to the relation of these to the pathology and treatment of diseases. Descriptive anatomists, such as Malpighi, by the aid of the newly improved microscope added greatly during his period to the store of anatomical knowledge which Vesalius had so enriched. It was not until the latter half of the 18th century, however, that there began with Morgagni, John Hunter, and his nephew and pupil, Matthew Baillie, the systematic study of pathological anatomy. In Morgagni's book, '*De Sedibus et Causis Morborum*' (1761), we have really the foundation of that study, and the museum of Hunter has formed a model for similar institutions all over the world. Great progress resulted in this century too from the studies of Haller and Wolff in the domain of physiology and embryology—all this regardless and, indeed, in spite of the ever-recurring speculations and systems which occupied so dominant a place in the medicine of the period.

The 19th century was ushered in by the epochal researches of Bichat, who, in recognizing the tissues and studying disease with reference to them, rather than to regions or organs, made an advance overshadowed only by the later discovery of the cell. Following him came the Parisian school of pathological anatomists including Corvisart, Laënnec, Cruveilhier and others, whose teachings were carried to England and Germany by their many scholars. Rokitsansky (1804-78), by taking advantage of the extraordinary opportunities offered in

Vienna, greatly advanced the knowledge of pathological anatomy. Doubtless the greatest name in the history of pathology is that of Virchow (1821-1902), who, spurred on by the discovery of the cellular structure of plants and animals by Schleiden and Schwann, soon convinced himself that every animal tissue is composed of and derived from cells, that no cell arises except as the offspring of a previously existing cell, and that spontaneous generation of cells is impossible. The application of these fundamental ideas to pathology resulted about the middle of the 19th century in the establishment of the doctrine of cellular pathology, which inaugurated the most important epoch in that science. The enormous amount of work which has followed has been entirely a confirmation and elaboration of these principles. The value of the experimental method, which has contributed so largely to exact pathological knowledge, although introduced by John Hunter and practised by Virchow and others, came into full general recognition especially by the work of Traube and of Cohnheim (1839-84).

During the last three decades of the 19th century the researches of Pasteur and of Koch, who have been followed by many workers in the fields opened by them, have shown the paramount importance of the relation of microscopic plants and animals to the production of disease. Physiological chemistry, established as a science by Liebig in the middle third of the 19th century, has cleared up many obscure problems. More precise methods of clinical research and experimental study of the problems of pathological physiology have added their important results. The last decade has been marked especially by those investigations into the laws of immunity which have been crowned with such brilliant success and have conferred such inestimable practical benefits on mankind, the names of Metchnikoff, Behring and Ehrlich being most prominently associated with these advances.

Definitions and Classifications.—Although human pathology in its broadest sense comprehends the entire science of medicine, as distinguished from the practice of the medical art, the term is sometimes used in a restricted sense as equivalent to pathological anatomy, the knowledge of which first placed pathology upon a scientific foundation. This knowledge is obtained by post-mortem examinations and by microscopic study of diseased tissues (pathological histology). But not less important than the knowledge of morbid structure is that of the altered activities or functions of the body in disease. This latter branch of pathology, which is called pathological physiology, rests upon clinical observations and upon experiment (experimental pathology). Even in the more comprehensive works on pathology it is customary to include only a relatively small part of the subject matter of pathological physiology, the larger part being assigned to works on clinical medicine. Both pathological anatomy and pathological physiology have been greatly advanced by the aid of chemistry (pathological chemistry). The term "general pathology" is used to include both general pathological anatomy and general pathological physiology, and embraces the consideration of such topics as the nature and causes of diseases, morbid processes common to many diseased conditions and dis-

turbances of function resulting from such processes. What is known as etiology, or the causation of diseases, is a subject of such extent and complexity that only certain of its aspects are usually treated of in works on pathology, other aspects being referred to the departments of hygiene, including bacteriology and clinical medicine. The terms comparative pathology, animal pathology and vegetable pathology are self-explanatory. The limitations of the present article are such that attention will be given mainly to a necessarily brief presentation of some of the more important general pathological processes, with particular reference to man.

General Principles in Pathology.—From what has been said of the scope of pathology it is evident that, as it is a study of the perversion of normal structure and function, there must be in each instance some underlying cause which brings about the disturbance. In every case it is found in the last analysis that there has been something which may be regarded as an injury either immediate or remote even to preceding generations, which has started the chain of events leading to the abnormal state. Frequently it is very difficult or impossible to discover the nature of the injury, but this does not in any way affect the principle and in each obscure disease the final discovery of the aetiological factor or cause reveals some injurious agency. In many cases the injury is such as to produce peculiar and perfectly specific changes in the tissue or specific disturbances of function, but in others the result is one that is the common effect of many causes. There are certain ways in which the body responds to injuries by stereotyped mechanisms of a defensive character which act because those are the common forms of response regardless of the nature of the attack, but there are others which are definitely aimed at the neutralization of a particular form of injury and these are specific and come into play only when that special injury occurs.

It is easy to review in broad lines the types of injury, and reflection will show the class into which each special form of injury will fall. Thus there are physical influences which become injurious and in the same way there are chemical injuries. As far as we know the whole race of bacteria act through their chemical effects although some of the larger animal parasites may cause mechanical injuries. We cannot quite place tumors which cause both mechanical and chemical injuries because we do not know anything about the reasons for their growth. Nor are we as yet quite sure about the importance of psychic influences in so far as their ability to cause material injury is concerned. The natural normal growth and development and functioning of the body is to a great extent the result of physical and chemical influences and it is easily understood, therefore, that the withdrawal of some of these influences may produce a diseased condition in a negative way quite as well as the intensification of others in a positive way.

Immutable laws do exist according to which normal growth and nutrition and the functioning of all parts of the body proceed. Of many of these we are only slowly beginning to recognize the existence through their being brought to our attention by being exaggerated or otherwise rendered conspicuous by disease. Such is

the recent comprehension of the rules which govern the behavior of the body when rendered immune or when rendered abnormally sensitive.

Restitution to normal depends upon some innate tendency toward a normal form and interrelation of structure. This restitution is carried out by the aid of certain reparatory and compensating growths of tissue which are to some extent influenced by mechanical factors, but which aim to re-establish the balance of tissues and organs and the type form of the body. But this repair and compensation for the loss of tissue could not ordinarily take place were it not for those reactions which have been evolved through ages to protect the body and to pave the way for its restoration to normal. They are inflammation, fever and the development of immunity.

Immediate Effects of Injuries.—The nutrition and metabolism of the tissues are chemical processes. Injuries of the most different kinds may so disturb these processes as to produce changes in the appearance of the cells which have long been recognized as common to many sorts of disease. They may be of the nature of the wasting of the cells, or on the other hand various substances which are ordinarily easily consumed or transferred elsewhere to be used in other chemical reactions may accumulate in or about the cells and become very conspicuous. Many of these rather heterogeneous changes have long been spoken of as degenerations and there is still much controversy as to their true significance. Thus fats of various sorts may accumulate in visible globules in cells in which they do not normally appear. Much of this is undoubtedly due to impairment of the function or even the structure of the cell, but often it is difficult to draw any line between what is normal and what is abnormal in this respect. So, too, the precise nature of the change in such organs as liver and kidneys which become swollen and opaque in some infectious and toxic diseases (cloudy swelling or parenchymatous degeneration) is not yet clear.

The abnormal distribution and disposition of mineral substances such as calcium and iron, or of pigments or crystals of unusual organic compounds, also form part of this theme and indicate in each case some disturbance of the metabolism of these substances.

When the injury to the cell is more profound and sufficient not only to disturb its function and the disposition of extraneous or food materials, but to cause its death, the structural changes quickly become far more evident. The nucleus fades or disintegrates and disappears and the whole protoplasm coagulates into a solid mass through the agency of certain ferments. Other ferments may in time dissolve and remove it, but in the meantime it appears as a hyaline pink staining mass. (Amyloid is a curious translucent substance, of little real importance, but prominent in the minds of pathologists, which resembles in appearance the hyaline material derived from coagulated cells and is deposited in the course of chronic infections in the crevices of many tissues).

Thus the injury which is severe enough to cause the death of a cell allows it when it is bathed in the fluid of the body to become clotted

into a homogeneous mass or later to be dissolved by ferments and removed.

Indirect Effects of Injuries.—The process of clotting or coagulation is an interesting and complex one which plays a part not only in the protective closure of injured blood vessels but in the solidification and exclusion from direct contact with the blood of all dead and harmful tissue. The blood clots when it comes in contact with a foreign body or with injured tissue. Thus it may clot in the heart or in the veins even from the passing stream if it flows over an injured part of the lining wall. Such a clot when formed in the streaming blood has a peculiar architecture and is called a thrombus. Portions of such a thrombus or indeed other undissolved substances may become loose in the blood stream and be carried to some narrow pass where they act as plugs (emboli) and by plugging the blood vessels obstruct the circulation to the corresponding tissue. If this obstruction is complete and the tissue deprived of the nourishing blood it dies throughout that area and in time becomes clotted. Such a dead and coagulated area is known as an infarct.

Disturbances of the Circulation.—The blood flows smoothly through all the tissues so long as the heart pumps properly with competent valves to keep the stream aright. But any obstruction, whether it be due to a plug in the blood vessel or a defect in the valve of the heart or a failure of the muscle of the heart, impedes the flow of the blood. Reflection will show that the failure to maintain the flow is as much an obstruction as an actual plug or the compression exerted by a tumor, on the aorta or vena cava. When any such obstruction prevents the access of blood to an organ that organ becomes anæmic, and it prevents the escape of venous blood, the organ becomes congested or hyperæmic. In this sense the term chronic passive congestion explains itself. When the fault is in the heart itself such chronic passive congestion may be general and leads to characteristic changes in the organ. It is one of many causes of œdema or infiltration of the tissue with fluid which has emerged from the veins or lymphatics to lodge in the crevices of the tissues. Other causes of œdema are in large part obscure, but we may mention a type which accompanies inflammation and another which seems due to the retention of salt in the tissues with a corresponding retention of fluid.

Inflammation.—Any injury of the tissues whether physical or chemical may be followed by a prompt reaction on the part of the whole body, most intense in the immediate neighborhood of the injury. This reaction is an elaborate one, evidently the result of evolution and selection, which is essentially protective and aims at the neutralization of the injurious agent by the pouring of the blood with its somewhat specific neutralizing materials and its phagocytic cells upon the injured place. Eventually this is an aid in removing any tissue which is too much injured and in cleaning the site of injury for repair. The reddening and heat which accompany this increased and rapid blood flow in the inflamed area are familiar. The swelling is caused by the œdema of the part.

Fever.—Fever is an accompanying reaction on the part of the whole body which aims to maintain the body temperature at a high point, not especially by excessive heat production, but by controlling the dissipation of heat. It is not entirely clear how this aids the body to overcome infection or other injury, but it is suggested that the high temperature favors the production of neutralizing substances.

Immunity.—The actual production of neutralizing substances, especially constructed by the body to act upon and destroy the injurious chemical agency which has been introduced, is a subject of such extent that it is treated separately in the article on IMMUNITY. It will suffice to say that there are several kinds of immunity, of which not all are due to the production of any specific soluble or circulatory substance. Indeed most of these kinds seem to be due to peculiar natural or acquired properties of the tissue cells themselves. Such are the natural forms of immunity, probably also the immunity from the effects of certain drugs such as morphia and arsenic and the lasting immunity from such diseases as smallpox conferred by one attack. Nevertheless, there is a group of diseases caused by bacteria which produce powerful soluble toxins in which the blood of those who survive is for a time charged with a substance developed during the disease which is able to neutralize the toxin. This is the antitoxin which may be artificially produced in animals and transferred to the blood of man so as to protect from or cure the disease. Examples of this are found in diphtheria and tetanus. In the case of other diseases, such as typhoid fever, vaccination with the bodies of typhoid bacteria confers a definite immunity from attack and has obliterated the disease from modern armies.

Healing and Repair Regeneration.—General mention of healing and repair has been made, pointing out the strong innate tendency toward the return of the injured organ or tissue to the closest possible approximation to the original form and arrangement. There is an immediate healing or patching of the injured place with fibrous tissue, no matter what was there before. This is carried out after the gluing together of the tissue surfaces by a clot of fibrin, and the principal part in the replacement of this temporary adhesive material is taken by blood vessels and connective tissue cells. Thus this form of healing is effected not necessarily by the sort of tissue which is injured, but in all cases by fibrous tissue which in the end figures as a scar. Another even more broadly useful part of the reparatory process is the new formation of enough of the specialized tissue which was injured to make up the normal quota. Thus if a part of the liver is destroyed the rest increases in size and in the number of its cells until the normal amount of liver tissue is once more reached. This form of repair may occur at a point far removed from the site of the injury. It is very well exemplified in cirrhosis of the liver, in chronic nephritis and many other conditions in which repeated injuries destroy the cells of the organ, but life is kept up because other distant cells multiply to replace those which were lost and to maintain the function of the organ as nearly as possible in its normal relations with other organs.

Hypertrophy and Atrophy.—The extent of this regeneration depends to some degree upon the demands which are put upon the organ. Even in the case of uninjured organs an increased demand for functional activity is met by an increase in the number of cells or sometimes an increase in the size of each and thus of the whole organ. When for any reason increased work is demanded of the heart it increases in size and the walls of its chambers become thicker and stronger. Such hypertrophy of the heart is ordinarily the response to an increased pressure or tension in the blood current. Inasmuch as the heart itself is the only source of energy to produce this tension it amounts to saying that the hypertrophy of the heart is due to increased resistance to the force of the heart beat, in overcoming which the heart grows larger and stronger just as does the blacksmith's arm with work. A quite different set of processes lead to the wasting or atrophy of tissues when they are not used or when their nutrition is impaired. Examples are found in the diminution in size of paralyzed extremities or the organs and tissues of the aged.

Mechanical Injuries.—The application of such principles to the explanation of the effects of injuries in disease is quite simple in the case of most mechanical disturbances, although these, too, often draw in their train a long chain of intimately connected happenings. Most common among these secondary results are the effects of the invasion of bacteria in tissues whose resistance is lowered by the injury or into which the bacteria are directly introduced by the wounding instrument. More complicated consequences also occur as when a gall-stone obstructs the bile duct and causes jaundice with a tendency to hemorrhage which makes surgical interference a menace to life.

Chemical Injuries.—Chemical poisoning causes a very great variety of lesions in the tissues and disturbs the functions of the organs in manifold ways, sometimes by killing the cells, sometimes by diverting the materials for their nutrition. See TOXICOLOGY.

Bacterial Infection.—The diseases produced by bacteria form a very important division of pathology and the nature of the bacteria themselves is discussed under bacteriology. For our purpose only pathogenic bacteria need be considered, and of these a few such as the diphtheria bacillus cause disease by producing a powerful soluble poison which is absorbed into the blood and carried throughout the body. Such bacteria really grow outside the body in a sense, inasmuch as they are found in wounds or on mucous surfaces whence they spread their poison.

In case of other bacteria no such strong poisons have been demonstrated in cultures or filtrates from cultures, but it seems that in the body they must produce very strong injurious substances of some sort for they cause the death of cells with which they come into contact, and even the destruction of rather distant cells. These are bacteria which invade the organs and multiply within the body, or even in the blood stream, until great numbers are present. Certain forms such as the streptococcus or staphylococcus may produce such a septicæmia and set up inflammatory reactions following the death of tissue wherever they lodge and form colonies. Puerperal septicæmia, carbuncles, boils, pneu-

monia, pleurisies and peritonitis are among the effects of these pyogenic organisms.

Pneumonia is ordinarily caused by one or other of the types of pneumococcus and is a disease in which the lung becomes filled with an inflammatory exudate of fibrin and cells formed round the millions of pneumococci which find their way into the bronchi and air cells.

The typhoid bacillus taken in with food or water invades the whole body, but causes characteristic changes in the lymphoid apparatus of the intestine, mesenteric glands and spleen. A great swelling of this tissue is produced by the accumulation of new cells which may undergo necrosis so that in the exposed lymphoid structures of the intestine ulceration ensues.

The tubercle bacillus is distributed in many ways in the body and where it lodges produces commonly small grey nodules of non-vascular tissue rich in cells which tend to become confluent and to undergo necrosis. In other cases in which the resistance is not great the bacilli may cause an acute inflammation with abundant exudate. This inflammation, especially in the lung, is quite as prone to be followed by a necrosis involving tissue as well as exudate, as is the case with the scattered tubercles. Combinations of these processes produce the great destruction of tissue seen in pulmonary phthisis and other tuberculous diseases.

Another widespread disease of great importance, syphilis is caused by the *treponema pallida*, a thin spiral organism which produces very different changes in the three or four stages which are characteristic of the disease. The primary lesion is an induration of the skin and underlying tissue, the secondary lesions are various eruptions on the skin and mucosae, while the changes in the tertiary stage are in the form of large necrotic nodules (gummata) in bones and internal organs.

Great numbers of other diseases are due to such bacterial invasion, but space forbids any discussion of these.

Animal Parasites.—Another great group of diseases is caused by the invasion of animal parasites usually very low in the scale of animal life. Of these the most important are the protozoan or unicellular organisms which cause malaria, amoebic dysentery and the sleeping sickness of Africa, although new forms are constantly being described. Malaria may be regarded as a type of such infections. The parasite is injected into the blood by the bite of a mosquito, and there goes through a cycle of development ending with division into many young spores, the emergence of which from the red corpuscles is accompanied by a chill. These spores enter other corpuscles and repeat the cycle. The mature forms when sucked out of the blood by another mosquito go through a different cycle in the body of the insect forming spores of another sort which reach the blood of a second human being by the next bite of the mosquito and start once more the human cycle. Similarly a great group of parasitic affection is due to the invasion of worms and occasionally even of insects.

Exanthematic Diseases.—Such diseases as smallpox, measles, scarlet fever, etc., appear to be caused by some parasite different from the bacteria. At present we are ignorant of the

nature of the organisms in this whole group of diseases, although it is certain that they present all the appearances of acute infections.

Anæmia and Leukæmia.—Many of the diseases already described as associated with the production of some form of poison are accompanied by a destruction of the red corpuscles of the blood which leaves the body supplied with a pale watery blood and constitutes anæmia. When the causative disease is known we speak of a secondary anæmia. There is, however, a kind of severe anæmia of which the cause is not known, and since it is a progressive and fatal disease it is called pernicious anæmia. Other curious conditions in which the blood is flooded with various leucocytes and other cells in enormous numbers are spoken of as leukæmias. Their nature is quite obscure, but it is known that in them as in the types of anæmia the bone marrow is very active in producing new cells.

Organic Insufficiency.—The partial or complete destruction of such organs as the thyroid, adrenal, pancreas, hypophysis and parathyroid give rise to profound disturbances, the nature of which is even yet but imperfectly known. For example, the destruction of the thyroid is followed by myxœdema, while what appears to be an increase in its activity or at least a perversion results in exophthalmic goitre. So too destruction of the pancreas or of the islands of Langerhans embedded in it is followed by diabetes, while equally characteristic diseases ensue when decreased activity or over-action of the other organs of internal secretion arises. The fact that some of these diseases (notably myxœdema and cretinism, which are due to destruction or maldevelopment of the thyroid) may be cured or greatly ameliorated by the administration of extracts of the corresponding gland promises much for the future when the relations of those which are as yet imperfectly studied become known.

Mental Diseases.—Derangements of the functions of the brain are naturally the result of all sorts of diffuse and localized destructive or injurious processes which are as likely to affect that tissue as any other. Some bacterial infections produce inflammations of the substance and covering of the brain and spinal cord (meningitis), while others acting more slowly cause not an acute febrile illness, but a chronic mental disease (syphilis causing general paresis). There are, however, many forms of insanity which crowd our asylums, but in which as yet we have not only failed to discover the cause, but are even unable to recognize any structural changes in the brain. In addition to these of which some appear to be due to infection or intoxication, there are many cases of defective mentality due to hereditary maldevelopment of the brain or to some defect of internal secretion.

Congenital Malformations; Monsters.—Great difficulty is met in the attempt to explain the origin of congenital malformations. That they are the result of peculiarities of the germ-cells or of disturbances in development is certain, but the nature of these disturbances is obscure. Experimental embryology, it is true, has shed some light upon them in showing that some may be produced by the action of injurious physical and chemical agencies during the incubation of the egg; and the evidences of

pressure, amniotic and placental adhesions, etc., in the malformed fetuses themselves explain others; but as to the origin of the greater number knowledge is wanting. In many instances the same malformation occurs in several members of the same family and seems hereditary.

When only one individual is concerned there may be all grades of defective or superfluous development from such familiar conditions as hare-lip to those in which the medullary groove has failed to close (*spina bifida*), or in which the tissue which should form the brain has remained spread over a deformed spine so that only a thin membrane is there to represent the brain (*acrania*). Such extreme malformations as the latter are incompatible with life after birth.

When two individuals are concerned they may be practically perfect but united, as in the case of the Siamese twins, at some point in the body; or with a more marked malformation they become more or less completely merged in one another. Sometimes one is relatively perfect while another very incomplete individual or part of one is fused into the body at some point and projects, as the so-called parasitic monster. A still more rudimentary mass, containing many of the tissues of a second individual, may be completely included within the body of the first and form there a sort of tumor called a teratoma. The simplest form of such tumors is the so-called dermoid cyst, which occurs most frequently in the ovary.

Tumors.—These are masses of atypical tissue which appear at some point or points in the body and proceed with an unlimited growth without serving any useful function, but rather to the injury of the organism. Much obscurity prevails as to their nature and origin, various theories ascribing their growth to disturbance of the equilibrium between tissues, to continued injury or irritation of the tissues, to congenital misplacement of embryonal cells which remain latent and begin to grow later, perhaps not until advanced age, and finally to protozoan parasites. During recent years many authors have described structures in the cells of cancerous tumors which they have regarded as parasites and the cause of the tumor growth, but as yet it cannot be said that there is convincing evidence as to the validity of any of these supposed parasites, and investigators are practically as much in the dark as ever with regard to the causation of the growth.

Tumors are usually composed of cells which, although atypical in form or arrangement, so closely resemble those normally present in the body—generally those in the immediate neighborhood or continuous with the primary growth—that they are regarded as developed from these analogous cells and are classified on this apparent histogenetic basis, their names being usually a combination of that of the tissue with the termination—*oma*. Thus a fibroma is a tumor derived from and composed of fibrous tissue; an epithelioma, one composed of epithelial tissue; a lipoma, one composed of fatty tissue, etc. Sarcoma and carcinoma, however, are so called from the resemblance of the former to flesh, and the latter from its fancied resemblance to a crab.

Tumors grow sometimes by the continual new formation of cells within themselves producing circumscribed, rounded masses which

push aside the surrounding tissue (benign tumors). Others rapidly invade by means of sprouts of cells the crevices of the surrounding tissue so that that tissue is destroyed, and on encountering lymphatic or blood vessels they penetrate their walls and distribute the cells into the blood or lymph stream so that new cell-colonies are formed in the organ in which these floating emboli lodge (malignant tumor). Such secondary tumor-masses are spoken of as metastatic nodules, and are always due to the transportation of cells. They may be very numerous and much more bulky than the primary growth.

Benign tumors may spring from the various forms of connective tissue, fat, fibrous tissue, bone, etc.; from epithelium, neuroglia and so on. They produce disturbances only by their bulk and the pressure they exert upon surrounding tissues. Malignant tumors may similarly arise from tissues of the connective type, from epithelium or from endothelium. They injure the organism not only by their bulk, but also by their destructive invasion of the surrounding tissues, and apparently likewise by the elaboration of a poison which aids in producing the cachexia so frequently seen in these cases. The most important of the malignant tumors are the sarcomata, which resemble in structure embryonic connective tissue, and the cancers or carcinomata, which spring from epithelium, commonly in such situations as the skin, the lining of the stomach or intestine, the breast and the uterus. Carcinomata are composed of communicating masses or strands of epithelial cells imbedded in a frame-work of connective tissue.

The great loss of life caused by the various kinds of tumors renders their study a matter of extreme importance, and the discovery of their causes and of trustworthy methods for their prevention and cure, to which many investigators are devoting their attention, constitutes one of the chief aims of modern medicine.

Bibliography.—Consult Garrison, 'History of Medicine.' Textbooks of pathology in English are by Hamilton, Green, Delafield and Prudden, Stengel and Fox, Mallory, Councilman Adami, MacCallum, Wells, Castellani and Chalmers, Manson (tropical diseases). References to the literature will be found in many of these books and there are many journals devoted to the subject such as *Journal of Experimental Medicine*, *Journal of Medical Research*, *Journal of Infectious Diseases*, *Journal of Pathology and Bacteriology*, etc. Among the works on bacteriology in relation to disease may be mentioned those of Muir and Ritchie, Abbott, Park and Williams, Kendall, Hiss and Zinsser, Marshall.

WILLIAM G. MACCALLUM, M.D.,
Professor of Pathology and Bacteriology, Johns
Hopkins University.

PATIALA, pūt-ē-ā'la, or **PUTTIALA**, Sikh native state in the Punjab, lying in the Cis-Sutlej group, with the exception of a small part in the hills near Simla. Two railway lines cross the state and the Sirhind Canal irrigates a large part of it. The rajahs have long been faithful to England, showing their loyalty in 1857, and in 1898, when the rajah, who died in 1900, personally took the field in the Tirah campaign against the Afghans. The state has valu-

able deposits of copper, lead, slate and marble; its area is 5,951 square miles, and population about 1,500,000, of which about one-third are Sikhs, one-fourth Mohammedans, and a small proportion Jains. The capital city is Patiala, on the Rajpura-Bhatinda Railroad; pop. 70,000.

PATIENCE, or **BUNTHORNE'S BRIDE**, a comic opera in two acts; words by W. S. Gilbert; music by Sir Arthur Sullivan: produced at the Opéra Comique, London, 23 April 1881, and in New York at the Standard Theatre, 23 Sept. 1881. The play is a satire on the "æsthetic movement" of the early '80s, a burlesque on the exaggerated and ridiculous form that movement developed among persons who, without natural taste of their own, tried to assume the attitudes and mimic the appearance of their intellectual superiors. The "high priest" of this absurd cult, Oscar Wilde, and his school of imitators, had for some time been satirized in the pages of *Punch* by Du Maurier and Burnand, so that the antics and the jargon of imaginary "æsthetic" circles had become familiar as household words. The witty ridicule of Gilbert, set to the tuneful melodies of Sullivan, was mainly responsible for the early disappearance of that style of "æstheticism." Patience, a dairymaid, gives the title and supplies the contrast of a healthy ignorance of æsthetic idealities. The scene is laid in a country of whimsical fancy; the plot is love, and develops around two poets and a host of "love-sick maidens."

PATINA, in the fine arts, the fine green rust with which ancient bronzes and copper coins and medals become covered by lying in particular soils, which, like varnish, is at once preservative and ornamental. An artificial patina is produced by the forgers of antiquities. The name is also applied to a bowl of metal or earthenware. See **PATEN**.

PATKUL, pāt'kool, Johann Reinhold, Livonian soldier: b. Livonia, Russia, about 1660; d. near Posen, Prussia, 10 Oct. 1707. He was of a noble family, received a military education and entered the army, but withdrew to enter upon a diplomatic career. He involved himself in intrigues which resulted in his being summoned to Stockholm, where, finding himself pre-condemned, he fled to Courland, and was branded as a traitor by the Swedish government. He entered the service of Augustus II, elector of Saxony and king of Poland, as privy counselor, and was largely responsible for the alliance of Russia and Denmark with Augustus against Sweden. He was accused later of treasonable relations with Austria and Sweden, and was arrested by Augustus. The Peace of Altranstadt, which Augustus was compelled to sign in 1706, stipulated the surrender of Patkul, who was tried by court-martial on the homeward journey of the Swedish troops, broken alive on the wheel, decapitated and drawn and quartered at a monastery near Posen. Consult Buchholz, 'Beiträge zur Lebensgeschichte J. R. Patkulus' (1893).

PATMORE, pāt'mōr, Coventry Kearsy Dighton, English poet: b. Woodford, Essex, 23 July 1823; d. Leyington, Sussex, 26 Nov. 1896. He was the son of Peter George Patmore, a writer of some note in his day, and published his first volume of poems in 1844, narrative pieces of little interest in themselves, but

displaying no little descriptive power and poetic insight. From 1846 to 1868 he was an assistant in the British Museum, and in 1854 published the first part of his most widely known poem, 'The Angel in the House.' It was entitled 'The Betrothal,' and was followed in 1858 by 'The Espousal.' It proved popular both in England and this country, was parodied and occasionally scoffed at; but many of its admirers as well as its critics failed to detect the mystical significance its author intended it to have. Patmore was a mystic through much of his career, and in this work he was typifying heavenly love by earthly affection. It was succeeded by 'Faithful Forever' (1860), a poem of disappointed love, and 'The Victories of Love,' a poem of bereavement (1862). Later volumes of verse include 'Amelia, Tamerton Church Tower' (1878), and 'The Unknown Eros and Other Odes,' in which latter, mingled with much of mysticism, will be found at least two of the most touching poems in the English language, 'Toys' and 'It was not Like Your Great and Gracious Ways.' Patmore was also the author of several volumes of prose, 'Principles of Art' (1889); 'Religio Poetæ' (1893); and 'Rod, Root and Flower' (1895). About 1868 he became a Roman Catholic, and some of his latest verse betrays his change of thought in this respect. At his best Patmore takes high rank as a poet and in spite of many trivialities his verse is more often melodious than otherwise. Consult Champneys, 'Memoirs and Correspondence of Coventry Patmore' (1900); Claudel, Paul, 'Coventry Patmore' (in *Etudes franciscaines*, Vol. III, Paris 1914); Gosse, E. W., 'Coventry Patmore' (New York 1905).

PATMOS, Grecian island in the Ægean Sea, off the coast of Anatolia, now called PATMO, PATIMO, or SAN GIOVANNI DI PATMO, once belonging to the vilayet of Jezairi-Bahri-Zefid. It measures 10 miles from north to south and contains about 15 square miles of rather rocky, unfertile soil. It once did a flourishing business with Ephesus, but at the beginning of the Christian era was a desert, used as a place of sequestration. Here Saint John was exiled and wrote the Apocalypse. At the close of the 11th century a monastery was built here in honor of Saint John, which had a very valuable collection of ecclesiastical manuscripts. Patmos was seized by Italy in 1912 during the Turco-Italian War. Pop. over 4,000, nearly all of which are Greeks. Consult Guérin, 'Description de l'île de Patmos et de l'île de Samos' (1856).

PATNA, pāt'na, more correctly **PAT-TANA** ("the town"), India, (1) a city of Bengal, capital of a district of the same name and of the division of Bihar, on the right bank of the Ganges, 397 miles by rail northwest from Calcutta. The city proper is one and a half mile in length by about half that extent in breadth; but with its large suburbs stretches nine miles along the Ganges, and presents externally a striking appearance from the river, many large and handsome flat-roofed houses with carved balustrades being interspersed with temples, mosques and tombs, Saracenic gateways of red stone, large granaries, wide ghats, or stairs from the water and bastions projecting into the stream—the whole backed by a height on the land side. The adjacent cantonments at Dina-

pur are handsome and well laid out. Patna is a stronghold of Mohammedanism, and the chief seat of the opium trade. A large business is done in oil-seeds, rice, salt-peter, wheat, indigo, sugar and provisions. Among the manufactures are table-linens, wax candles, lacquered wares and bird cages; brocades, embroidery, pottery, toys, fireworks, gold and silver wire and leaf, glassware, boots and shoes, carpets and furniture. Patna has been identified with the ancient Pataliputra—Lotus City, which was probably founded in the 5th century B.C. Megasthenes, a Greek historian, who visited it about 300 B.C., describes it under the name Palibothra, and a Chinese pilgrim of the 7th century A.D. has also left an account of it. The native name Azimabad was given to it in honor of Azim, grandson of Aurungzebe, who was at one time its governor. The English, French and Danes had factories here formerly, but eventually the British traders drove out their rivals. In 1763 disputes about transit duties arose between the East India Company's servants and the native government. The result of the war which followed was the expulsion of the native forces and the district coming into possession of the British. Patna was the headquarters of the Wahabi or Mussulman conspiracy of 1864. Pop. about 140,000. (2) The district has an area of 2,076 square miles. Pop. about 1,625,000. (3) The division has an area of 23,675 square miles. Pop. over 16,000,000. (4) A native Rajput state, feudatory to Bengal; area, 2,399 square miles. Pop. about 300,000.

PATON, pāt'n, **SIR JOSEPH NOEL**, English painter: b. Dunfermline, Scotland, 13 Dec. 1821; d. Edinburgh, 26 Dec. 1901. He became first known to the public by his water-color painting of 'The Combat between Bothwell and Balfour' (1838); and soon afterward grew into popularity as an illustrator of books and magazines. In 1843 he attended the art school of the Royal Academy in London, and exhibited in 1844 his well-known picture 'Ruth Gleaning.' The following year he exhibited 'Rachel Weeping for Her Children,' in 1846 'Oberon and Titania,' and 'Christ Bearing the Cross.' He painted for Queen Victoria 'The Queen at the Deathbed of the Prince Consort.' He was more or less of a Pre-Raphaelite, but his drawing, while graceful, is sometimes weak, and his color lacking in harmonious arrangement. His skill as a sculptor and his learning as an archæologist were almost equal to his pictorial skill, and he wrote graceful verse and published 'Poems by a Painter' (1861), and 'Spindrift' (1867). In the latter year he was knighted. He made the drawing for the great glass windows which Andrew Carnegie had restored in 1884 in Dunfermline.

PATON, Lewis Bayles, Congregational clergyman and educator: b. New York City, 27 June 1864. He graduated at New York University in 1884 (A.M. 1893); at Princeton Theological Seminary in 1890; studied at the University of Berlin 1890-92; received the degree of Ph.D. at the University of Marburg 1897; and D.D. at New York University 1906. He was ordained to the Presbyterian ministry in 1890, and transferred to the Congregational ministry in 1892. He was instructor 1892-93, and associate professor 1893-1900 of Old Testament exegesis and criticism at Hartford Theological

Seminary, and since then Nettleton professor. He was director (1903-04) of the American School of Oriental Study and Research in Palestine at Jerusalem; and is honorary secretary for the United States of the Palestine Exploration Fund. He edited 'Recent Christian Progress' (1909); contributed to journals, encyclopedias and dictionaries of archaeology and religion, and published 'Early History of Syria and Palestine: Jerusalem in Bible Times' (1908); 'Esther (International Critical Commentary), The Early Religion of Israel' (1909).

PATON, William Agnew, American author: b. New York, 20 April 1848; d. 11 Dec. 1918. He was publisher of the *New York World* (1877-81); connected with *National Republican* (1881-85); United States commissioner (1883); business manager of *Scribner Magazine* (1885-87). He wrote 'Down the Islands: a Voyage to the Caribbees' (1887); 'Picturesque Sicily' (1897); 'The First Landfall of Columbus' (1907); 'Home Rule Ballads' (1907).

PATRAS, pā-trās', or **PATRÆ**, pā'trē, a seaport of the northwestern Peloponnesus or Morea, on the Gulf of Patras, which leads into the Gulf of Corinth. The port is ill-protected and owes its importance to its position; olive oil, wines, raisins and sheepskins are exported, and there are mills, foundries and cotton and silk factories. The city is essentially modern and lies some distance from the old town, which had a great commerce in the 5th century B.C., and again in the 1st when it was rebuilt by Augustus and became famed for its cloth manufactures and as the site of the Oriental worship of Aphrodite. During the Middle Ages it was the chief commercial city of the Peloponnesus. Now the city is a station of the Austrian Lloyds and the Mediterranean and New York Steamship Company connects it with New York city. It has several consulates, among them one of the United States; pop. about 40,000.

PATRIARCHAL SYSTEM (Greek, *patēr*, father, *archē*, rule). The extreme paternal form of the family in which the authority of the husband and father in the family has become so supreme that he is practically owner of all persons and property of the family group, the wife and children being reduced if not to the position of property at least to the position of subject persons. A second characteristic of the Patriarchal System is that the family organization usually included not only all persons related by descent through common male ancestors but also all persons received into the family by the ceremony of adoption and even all slaves and dependents. The patriarchal family, therefore, frequently consisted of hundreds of individuals, and was a little political unit, the head of which was the eldest living male.

Classical pictures of the patriarchal system may be found in the description of the lives of the Hebrew patriarchs in the Old Testament. Practically all European and Asiatic peoples were in this stage of social development when they first appear in history. For this reason, Sir Henry Maine thought that the patriarchal family was the original type of family in the human species. (See *FAMILY, HISTORY OF*). This view is contradicted, however, by the fact that the maternal family and the maternal system of relationship are much more widely

prevalent among all uncivilized peoples. Anthropologists and sociologists now universally agree that the patriarchal system is a relatively late development in the history of the family. It reached the acme of its development in early historic times among the Hebrews, Greeks, Romans, Hindus and Chinese.

The causes of the development of the patriarchal system were complex. Wife capture and wife purchase, together with the growth of the idea of property and persons, in the period of barbarism were doubtless contributing causes. But the decisive factor in creating the patriarchal family was pastoral industry. The keeping of flocks and herds of domesticated animals necessitated the separation of families through their wandering over long stretches to secure pasturage, and at the same time the employment of a large amount of male labor. Under such conditions the husband gained great power over his wife, as she was separated from her kindred, and as the owner of the flocks and herds which constituted almost the sole property of the group, his authority gradually became supreme in all matters.

But the fully developed patriarchal system received its stamp from that primitive religion which we know as ancestor worship. This religion, deifying the departed male ancestors, tended to reinforce the authority of the house father, because he was the oldest living ancestor, and the representative, so to speak, of the gods upon earth. Thus arose the *patria potestas* of the Roman father, that is, the power of life and death over all members of the family group. This power, however, could not well be exercised arbitrarily, as the house father was necessarily controlled by religious scruples and traditions. Disobedience to the house father was, however, disobedience to the divine ancestors, and hence was usually severely punished.

Among the Hebrews and some other peoples we find the patriarchal system without ancestor worship; but in such cases the evidence seems to show that ancestor worship once existed, but had been largely obliterated through the adoption of a higher religion.

The patriarchal system is now chiefly of interest because of its effects upon later history. Inasmuch as all the chief historical peoples of Europe and Asia have passed through a patriarchal stage of development, the history of these peoples can scarcely be understood without a knowledge of the patriarchal system. Not only have our historical ideas regarding the family, but also those regarding property, government and religion, been influenced by the patriarchal system. Patriarchal ideas, it has often been pointed out, have been impediments to progress along these several lines; but at the same time it must be acknowledged that no high degree of social organization, as Spencer insisted, would have been possible if there had not been a patriarchal stage of development.

CHARLES A. ELLWOOD,
Professor of Sociology, University of Missouri.

PATRIARCHS, the three fathers of the Hebrew race, Abraham, Isaac and Jacob. The patriarchal government prevails in a state of society in which the people are not yet organized into a nation, but consist of independent tribes, clans or families under the government of the head of the family. Later the title patriarch was assumed by the presidents of the sanhedrim, which exercised authority over the Jews of Syria and Persia after the fall of Jerusalem. The patriarchate of Tiberias for the Western Jews lasted till 415; that of Babylon for the Eastern Jews till 1038. From them the term was borrowed by the Christians, who applied it to the bishops of Rome, Constantinople, Alexandria, Antioch and Jerusalem. These patriarchs consecrated and supervised the archbishops and bishops within their jurisdictions. While with the patriarchate of Rome was united the primacy of the Roman see throughout the world (see **PAPACY**), the four heads of the Eastern Church preserved the title of patriarch. The Armenian, Abyssinian, Jacobite and Maronite churches have patriarchs of their own. The Patriarch of Constantinople is the primate of the Greek Church in the Turkish Empire, and bears the title of œcumenical. (See **RUSSIAN RELIGION**.) The authority of the Patriarch of Moscow which extended over the Russian Church was superseded, during the reign of Peter the Great, by the holy synod. Consult Bingham, 'Origines' II; Morin, 'De Patriarcharum origine'; Neale, 'History of the Eastern Church'; Riddle, 'Christian Antiquities.'

PATRIARCHS MILITANT. See **ODD FELLOW**.

PATRICIANS (Latin, *patricius*, from *pater*, father), the name given by the Romans to the members and descendants by blood or adoption of the original *gentes* of which the Roman people was composed, until the plebeians became a distinct class of citizens. The other sections of the Roman population, the clients and slaves, did not belong to the *populus Romanus*. During the first centuries of the republic there was an almost uninterrupted struggle between the patricians and plebeians, in which the former fought hard to retain their exclusive rights, but which ended in the establishment of the political equality of the two orders; only a few insignificant offices remained the exclusive privilege of the patricians. The formation of a new aristocracy, founded on wealth and on the holding of the offices of consul, prætor and curule ædile, made the patricians of still less account. When the seat of government was removed to Constantinople, Constantine the Great, desirous of restoring the ancient Roman ranks, instituted a new patrician dignity, which was a mere personal title, and which could be acquired only by high birth and distinguished merits. Under the Carolingians and the succeeding emperors the title of patrician denoted an exalted rank, and was connected also with the government of Rome and its provinces, and the support of the Papal See. Charlemagne assumed the title of a Roman patrician before he was declared emperor, and Henry IV, as such, deposed Pope Gregory VII. In modern times a few noble families in the imperial cities were called patricians, because they were especially entitled to certain high offices. In some Italian cities the

title of patrician is still used to denote a member of the nobility. Consult Botsford, G. W., 'The Roman Assemblies' (New York 1909); Bryce, 'Holy Roman Empire' (New York 1911); Burg, J. B., 'Later Roman Empire' (London 1899); Foltz, 'Beitrage zur Geschichte des Patriciats in den deutschen Städten' (Munich 1899). See **ROME**; **PLEBEIANS**.

PATRICK, Saint, the apostle and patron saint of Ireland. The date of his birth has variously been placed at from 373 to 389; and his death from 461 to 493. One tradition says he was born at Kilpatrick, another at Dumbarton, Scotland, but the place of his birth, Benneventa, has never been definitely settled. Some authorities are inclined to place it somewhere on the southwest coast of Britain, near the Irish Channel; others as stoutly maintain it was in the north, while others place it on the Severn River. His Celtic name was *Sucat*, to which, as he seems to have been brought up as a Christian, the name of *Patricius* was probably added. His father, Calpornius, a native Briton, seems to have been a man of some influence in the community, a decurion, or member of the municipal council and apparently a friend of the Romans. His grandfather, Potius, was a presbyter. When 16 years of age Patrick was taken prisoner by some Irish who made a raid on western Britain, and was carried off into slavery in Ireland "near to the western sea." After six years, he succeeded in making his escape to the Continent, probably to western France, an uninhabited country through which he and those with him traveled 38 days suffering many hardships, before they came to an inhabited part of the country. There Patrick finally found refuge in the Monastery of Lérins, on an island off the west coast of Provence, where he seems to have remained for some years, after which he returned home to Britain. There he claims to have had a vision of himself going as a victorious apostle of Christianity to the Irish. This he regarded as a divine call; and he went back to Autissiodorum (Auxerre) in Gaul, where after a period of study and preparation, he was ordained bishop together with two other prospective missionaries for Ireland. This work of preparation in Gaul seems to have covered 14 years, for it was not until 432 that he became bishop of Ireland on the death or retirement of the Irish bishop Palladius. He at once took possession of his new office, filled with enthusiasm for a work to which he seems to have long looked forward. It is probable that the Christian communities in Ireland were, at this time, confined to the south and west of the island; and the task before the new bishop was not only to minister to these and to hold them together, but also to gain the goodwill of the various local rulers, or as they styled themselves, kings. His knowledge of Irish and Latin was a very valuable asset in this work; and his experience of six years in the country had given him an insight into the character of the people that he could probably not have learned as well in any other way. It is probable that he landed at the mouth of the river Vartry in Wicklow at a place called Inverdea; and from there he went into east Ulster (Ulidia); and began his missionary work on the southwest side of Strangford

Lough, in a wooden barn given him for religious purposes, by an Irish convert known as Dichu, a chief and a man of importance in that part of the island. True to his mission, he seems not only to have preached, but also to have done his best to interest in Christianity the rulers of the various districts, over whom was a head ruler or king called Loigaire. Through the influence of Patrick, Fedilmid, brother of Loigaire, declared himself a Christian and gave his support to Patrick and presented him with an estate at Trim, to be used to found and support a church. Through his influence the bishop seems to have gained the protection of Loigaire, though the latter never deserted the faith of his ancestors, and thus to have been enabled to gain converts and to found churches in various parts of the island, though he seems to have given more of his attention to the north than to the south of Ireland. Many legends and traditions, most of them of a miraculous character, are connected with this period of his work and with various parts of the island. It seems that he visited Rome (441-443), saw Pope Leo, got his enthusiastic approval of the Irish work and brought back with him noted relics from the papal city.

On his return to Ireland in 444 he made Armagh the ecclesiastical capital of the island. The land on which the church here was built had been given him by King Daire of Oriel. In his later years he was bitterly criticized and he finally resigned his office as bishop and retired probably to Saul in Dalrdaia where he died, it would seem according to the best authority, in 461. He has left two important documents; one of which is his 'Confessions,' which is a sort of autobiography, written toward the close of his life, and the other, the 'Letter to Coroticus,' the British king of Strathclyde. In this latter document Patrick urges the Christian subjects to have nothing whatever to do with the king until he repairs certain very grave offenses against the Christians in Ireland.

Saint Patrick seems to have been a man of very strong will power and very considerable executive ability. He must have been much of a diplomat to have achieved the success he did in the midst of warring factions at a period when the power of druidism was very strong in Ireland. Whatever may be doubtful about his life, there can be no doubt that he was a great organizer, and that his enthusiasm and his faith in his work inspired him to treat with kings and princes, as though they had been put there for his purposes of the spread of the Christian faith. He was a man of tireless action and enthusiasm in his work; and we are told that he founded 360 churches, baptized with his own hand 12,000 people, and ordained a great many priests. Though, at the conclusion of his work, Ireland was still more pagan than Catholic, yet he had dealt a death blow to the religion of the druids, which was shortly to disappear before the onward march of the ideas set into motion by him. He influenced strongly the Irish mind, and Celtic imagination has surrounded him with picturesque legends. He banished the snakes and toads out of Ireland; he performed the most astounding miracles in his contests with the druidical priests; he confounded his enemies by bringing down darkness upon them; and many equally wonderful

things tradition credits him with doing. His name is connected with scores of localities throughout Ireland, and generally there is some local story connected therewith. At his death so great was the glory that there was no night for 12 days.

PATRICK, Saint, Order of. See ORDERS AND DECORATIONS.

PATRICK, Albert T., American lawyer: b. Texas, 19th century. He was engaged in practice when charged with inspiring the murder of William Marsh Rice, an aged millionaire, on 24 Sept. 1900. Patrick was convicted 26 March 1902 and was sentenced to be electrocuted, but secured appeals which delayed the execution of the sentence. His sentence was commuted to life imprisonment by Governor Higgins in 1906 and he was pardoned by Governor Dix in 1912. The motive for the crime was supposed to be Patrick's inheritance of the Rice fortune through a bogus will. It was said that the conduct of the case during the 12 years cost Patrick and his friends \$162,000.

PATRICK, Mary Mills, American college president: b. Canterbury, N. H., 10 March 1850. She was educated at Lyons College, Iowa, the State University of Iowa and at the universities of Heidelberg, Zurich, Leipzig, Berlin and Berne. She became president of the American College for Girls at Constantinople in 1890. She was a member of the Psychological Congresses at Munich in 1896 and at Paris in 1900; and of the Philosophical Congresses at Paris, 1900, and at Bologna in 1911. Author of 'Armenian Translation of Text-Book of Physiology' (1876); 'Sextus Empiricus and Greek Skepticism' (1899); 'Sappho and the Island of Lesbos' (1912), etc.

PATRICK, Simon, English Anglican bishop: b. Gainsborough, Lincolnshire, England, 8 Sept. 1626; d. Ely, Cambridgeshire, 31 May 1707. He was educated at Queens College, Cambridge, became rector at Covent Garden in 1662, in 1678 was appointed Dean of Peterborough, became Bishop of Chichester in 1689, and of Ely in 1691. He defended the Reformation, during the reign of James I, though in early life he had written against the Non-conformists. His views changed, however, later

and he favored the Nonconformists in many ways, and he did his best to lessen the misunderstanding and ill-will existing between them and the Anglicans. A man of vast learning and a wise ecclesiastic, he was the author of numerous devotional treatises, some of which are still read. A complete edition of his works (9 vols.) edited by Alexander Taylor and including Patrick's 'Autobiography' was published in 1858. Among his published works are 'Conformist and Non-Conformist'; 'Mensa Mystica'; 'The Heart's Ease'; 'The Parable of the Pilgrim'; 'The Christian Sacrifice'; 'The Dignity of the Christian Priesthood'; 'Paraphrases upon the Books of the Old Testament' (10 vols., from Genesis to Solomon, 1695-1710). Consult Chamberlayne, T., 'Mémorial' (in 'The Parable of the Pilgrim' (London 1839).

PATRIMONIUM PETRI, *păt-rî-mô'-nî-tum pē'trî*, or **PATRIMONIUM ECCLESIAE**, the territory of the papal government during the time when the temporal power of the pope was a reality. In a narrower sense it denotes the territory nearest Rome which became the property of the papal curia in the 8th century. Dante, however, attributes the original territorial possessions of the Roman bishopric to the gift of Constantine.

PATRIOFELIS, a creodont animal found fossil in the Middle Eocene formations of Wyoming, which was about the size of a lion, but was of aquatic, or semi-aquatic, habits, and preyed much if not altogether upon the turtles which abounded in the shallow waters of that region during Eocene times. It is regarded by some writers as a possible ancestor of the seals. See CREODONTA.

PATRIOTIC SOCIETIES, in the United States are those organizations which aim to foster love of country through the celebration of important events in American history, and by keeping alive memories of the heroic sacrifices of Colonial and other wars and the preservation and restoration of historic sites and monuments. Among the societies devoted to the colonial period are: Society of Mayflower Descendants, Society of Colonial Wars, Order of the Founders and Patriots of America, Society of Colonial Dames of America, National Society of Colonial Dames, Society of Daughters and Patriots of America, Holland Society, New England Society, American Flag Association, Society of the Ark and The Dove, Order of Washington, Order of Pequot and King Philip, National Society of Scions of Colonial Cavaliers.

In commemoration of the Revolutionary War there are numerous organizations including the Society of the Cincinnati, Sons of Revolutionary Sires, Society of the Sons of the American Revolution, Naval Order of the United States, Military Order of Foreign Wars, Saint Nicholas Society of New York and others. Subsequent societies were the General Society of the War of 1812, Veteran Corps of Artillery, American Order of the Louisiana, the Aztec Club (q.v.), Association of Mexican Veterans, Society of the Descendants of the Signers of the Declaration of Independence, the Society of the Dames of the Revolution, the Society of the Daughters of the American Revolution, Society of the Children of the American Revolution, Society of the United

States, Daughters of 1812, Daughters of the Republic of Texas.

As the outcome of the Civil War the following were among the patriotic societies organized: Military Order of the Loyal Legion, Grand Army of the Republic with its adjunct—the Woman's Relief Corps, Union Society of the Civil War, Union Veteran Legion, Sons of Veterans, Union Society of the Civil War, Society of the Army of the Cumberland, Society of the Army of the Potomac, Society of the Army of Tennessee, Eleventh Army Corps Association, Second Army Corps Association, Thirteenth Army Corps Association, Union Society of the Civil War, Military Order of the Medal of Honor, National Association of Naval Veterans (q.v.), Medal of Honor Legion (q.v.), United Confederate Veterans, United Daughters of the Confederacy, United Sons of Confederate Veterans.

Other patriotic societies include the Order of Indian Wars of the United States, Society of Veterans of Indian Wars, Order of the Serpent, United Spanish War Veterans, Society of the Army of Santiago de Cuba, Military and Naval Society of Porto Rican Expedition, Rough Riders Association, Society of the Caribbean, Military Order of the Carabao, National Society of the Army of the Philippines, Military Order of the Dragon, Military Order of Foreign Wars, Mount Vernon Ladies' Association, the George Washington Memorial Association, Ladies' Hermitage Association, National Society of Patriotic Women of America, Landmarks Club of Los Angeles, Colorado Cliff Dwellers' Association, Thomas Jefferson Memorial Association and the American Scenic and Historic Preservation Society. Under the heading of patriotic societies may also be included the numerous State and local historical societies. See HISTORICAL ASSOCIATION. AMERICAN.

PATRIOTS' DAY, in Massachusetts, the anniversary of the double battle of Concord and Lexington, 19 April 1775. The day was first observed in 1894.

PATRIPASSIANS. See SABELLITUS.

PATRISTIC THEOLOGY, that section of Christian literature bearing particularly upon ethics and doctrine which is contained in the writings of early fathers of the Church, a term generally confined to writers of the first five or six centuries of the Christian era. They are generally classed as Patristic Fathers or Apostolic Fathers, who were nearest to and partly contemporary with the Apostles, namely Pseudo-Barnabas, Clement of Rome, Ignatius, Pseudo-Ignatius, Papias, Hermas and Polycarp; the ante-Nicene Fathers, who lived between 167 and the Nicene Council 325, and the post-Nicene Fathers. The Eastern and Western Church have each a group of authors who are recognized as fathers par excellence. Those of the Eastern Church are Athanasius, Basil, Chrysostom, Gregory Nazianzen, Cyril of Alexandria and John of Damascus, while those of the West are Jerome, Ambrose, Augustine, Gregory of Rome, Leo the Great and Hilary of Poitiers—to whom are often added Bernaud of Clairvaux, Thomas Aquinas and Bonaventura. Consult Migne, J. P., 'Patrologiæ Cursus Completus' (221 Vols., 1844-65); Pusey, E. B., 'Library of the Fathers' (47 vols. 1838-80); Lightfoot, J. B., 'Apostolic Fathers' (5 vols., London

1889-90); Farrar, F. W., 'Lives of the Fathers' (2 vols., Edinburgh 1889); Krüger, G., 'History of Early Christian Literature' (Gillett's trans., New York 1897).

PATROCLUS, pa-trō'klūs, the friend and brother in arms of the Greek champion Achilles, was the son of Menetius, one of the Argonauts. On accidentally killing Clytonymus, in his early life in a game of dice at Opus, he saved himself by flight, and reached Thessaly where he was kindly received by Peleus, who educated him as the companion of his own son. He accompanied Achilles to Troy, and remained, like him, inactive, when the anger of Achilles kept him from taking a part in the war. At length Achilles permitted Patroclus to go forth to battle, where he was arrayed in the armor of Achilles. Apollo stunned him and rendered him defenseless, and he was slain by Euphorbus and Hector. The Greeks recovered his body, which they interred with the highest marks of honor, and established solemn funeral games to his memory. Achilles then avenged his friend by challenging Hector and slaying him in single combat.

PATROL, a military term applied to the walking or marching round of a guard to watch and observe what passes, and to secure the peace and safety of a camp or other place. In the European War the word has been applied also to scouting parties sent out between the lines to gain information or to prepare for an attack in force. Also men on guard who go the rounds in the night; a detachment whose duty it is to guard; or a policeman whose duty it is to patrol a certain district or beat for the protection of property and to preserve the peace. Such policemen are frequently called patrolmen. In early American history the word patrol was applied to a military system adopted by the parishes of most of the Southern colonies, notably South Carolina. The patrol was a sort of police for the parish and was designed especially to prevent and subdue insurrections among the slaves. In South Carolina the patrol was established by law in 1704. The patrollers furnished their own pistols and horses. They rode from plantation to plantation and arrested all slaves who could not show passes from their owners. This system soon became general through the South, and continued under various forms for many years.

PATROL, Insurance. See **INSURANCE PATROL**.

PATRON (from the Latin "Patronus" through the French "patron"). The word was directly connected with "pater," father, and in its signification and use undoubtedly dates back to patriarchal days. Among the Romans, a name denoting a patrician who had plebeians under his immediate protection, and whose interests he supported by his authority and influence. When Rome had conquered many nations, noble Romans were sometimes the patrons of whole cities and provinces, and such patronage even descended by inheritance in some families. The Marcelli were patrons of the Sicilians because Claudius Marcellus had succeeded in conquering Sicily. Patron was also the title of every advocate who represented the interest of another, his client. In later times the term patron was applied to every protector or influential promoter of the interests of

others; hence the saints who were believed to watch over the interests of particular persons, places or trades were called patron saints. The patron became the guardian of a clients' interests and upheld these interests in the law courts. Patron and client were under a legal obligation never to accuse one another, down to before the Christian era. Even to-day throughout Latin countries the patron is a person of importance. In Spanish America the name is given to the head of a family or business by his employees; and the word is used in much the same sense as "boss" in English. One who provides food for a feast or entertainment is also designated the patron of the occasion. When a new business is opened with a dinner or reunion to celebrate the occasion the giver of the feast is known as the "patron"; when a child is baptized there is a patron for the occasion. The person who freed his slaves in Roman days generally retained toward them the relationship of patron or protector, that is the old patriarchal relation of a father to his family; and this relationship was recognized in early Roman law—as the patronus pleaded for them in court or on special occasions, the word in Latin came to have the special meaning of lawyer. In an ecclesiastical sense, a patron has long had the meaning of one who has the right to present a "living" or other preferment to a clergyman. In Spanish countries this idea is carried further, and a captain of a ship or the landlord of a rented property or the keeper of an inn or hotel is familiarly called the "patron."

PATRON SAINT, the canonized saint who is sometimes credited with watching over, protecting or interceding for certain persons, places, trades or institutions. Thus Saint George is commonly called the patron saint of England, Saint Denys of France and so on. In the Middle Ages every trade had its patron saint. Saint Clair was the patron of lamp-lighters; Saint Cloud of nailers; Saint Blanc or Blanchard of laundresses; Saint Peter of fishermen; and Saint Dunstan of goldsmiths. The patron of an individual is generally the saint by whose name he was baptized. In most Latin countries a person celebrates not only his birthday but each of his saint's days. It often happens that he may be required to celebrate one certain saint's day several times in the year, as that of Saint John or that of Saint Joseph. So it is common to add to such a name a specific to determine which John or Joseph it is. Thus we have "Juan de Dios" (John of God) in Spanish as a very common baptismal name; and in French John the Baptist is so common that in some parts the French peasants are designated "Baptist." The same thing happens with Jesus, which is a common baptismal name in Latin Catholic countries; and the curious combination Jesus Mary is frequently met with in men's names. This limits the name to one person, Jesus the son of Mary.

PATRONAGE, the right vested in a person, official, or political party, of appointment to offices and positions, the award of contracts, the disposition of emoluments, pensions, etc. Except in special cases, the right of appointment to office was vested by the Constitution of the United States in the President, his selections to be confirmed by the Senate, and up to the time of the Civil War, the President main-

tained actual as well as nominal control of appointments. But during and after that period the patronage at the disposal of the national government increased at such a rate that the political manipulation of offices became exceedingly complex. Practical dictation to certain offices was gradually acquired by the senators who by courtesy secured the control of appointments, each in his own State, although in form, the initiative and the responsibility remains with the President.

In the field of State and local government, cities furnish the greatest display of the misuse of patronage as appointments are numerous and elective officers few. Except in the matter of building contracts, supplies, etc., education, fortunately, has usually been considered outside the domain of politics, and teachers have been chosen primarily with a view to fitness for their positions. In the combination of Federal and local patronage, the number of voters who get, or expect to get employment in case of a party victory is so large that it tends to destroy true party balance. The need of controlling this power has led several States to enact civil service laws with the object of taking most of the appointive offices out of politics.

Experience shows that instead of being the support of the party system, patronage tends rather to its destruction. There are never spoils enough to "go round"; bitter factions grow up and their selfish strife disrupts the party. Patronage is in fact a concealed form of bribery; the giving of office or contracts as rewards for party service works insidious corruption of political morality. A large proportion of voters regard offices as perquisites of the party, as gifts bestowed upon the faithful, rather than as positions of public trust, and as Horace Bushnell has strikingly observed, "such a system would corrupt a nation of angels."

Ecclesiastical patronage is the right vested in a church body or a layman to appoint a properly qualified person to a vacant church appointment. Marked by much contention and various abuses during the Middle Ages, the history of ecclesiastical patronage goes far back into the centuries and still exists, to some extent, in the Protestant churches of Europe. In the United States, ecclesiastical patronage is vested usually in the official body of laymen supporting a church, with the exception of Catholic churches where it is vested in the diocesan bishop on the general principles of the canons of the third and fourth Lateran councils as decreed by the plenary councils of Baltimore. See CHURCH GOVERNMENT.

PATRONS OF HUSBANDRY. See GRANGERS.

PATRONYMIC (a name taken from one's father), a term which designates a person in reference to some of his ancestors, either immediate or remote. In Sanskrit, Greek and Latin patronymics are very common. In Sanskrit they have 13 recognized terminations. In Greek the suffixes were *idēs*, *ionēs*, *iadēs*, *eides*, etc., for the masculine, and *ias*, *is*, *as*, etc., for the feminine. Achilles is called by Homer both Pelides and Æacides, Peleus being his father's name and Æacus that of his grandfather. The Latins borrowed their patronymic terminations *ides* and *is* from the Greek. Among modern languages the Russian, Danish, German and

English have adopted patronymic terminations, the suffixes being respectively *vitch*, *sen*, *sohn* or *son*, and *son*. In Portuguese, Italian and Spanish patronymics are very common. The Norman *Fitz*, the Welsh *Ap*, the Irish *O* and the Highland *Mac* are prefixed to the paternal name, which thus becomes a patronymic. Patronymics may be derived from the name of father, mother, grandfather or remote ancestor. The latter is the case with most modern patronymics. In Russian patronymics have companions, a matronymic, as for example "Pavlovna," the "daughter of Paul," while the name "Pavlovitch" means the "son of Paul." In Spanish Christian or family names regularly become patronymics by the addition of "ez." Thus González, a very common patronymic, is the "Son of Gonzalo." Consult Bradley, C. W., 'Patronomatology' (Baltimore 1842); 'Die Patronymica im Alt-Indischen' (Göttingen 1903). See NAMES.

PATROONS (Dutch, "protector" or "patron"), a popular name applied in colonial days to a special class of settlers in the New Netherlands. In 1629 the Dutch West India Company, in order to effect a permanent agricultural colonization of New Netherlands, granted a charter of "privileges and exemptions" to any members of the company who would within four years plant a colony of 50 anywhere in New Netherlands, except on Manhattan Island. These wealthy grantees were called Patroons, and were privileged to rule their colonies in absolute feudal style, the colonists being bound to them for a certain number of years. Each patroon was entitled to have as his absolute property 16 miles of land along any navigable river, or eight on each shore, and so far inland as convenient. The proprietors were empowered to hold civil and criminal courts, to appoint magistrates and other local officers, and in general, to punish offenders against the law. The settlers were exempt from taxes for 10 years, but they had to pay certain rentals. Slavery was introduced into these settlements, trade and commerce were greatly restricted and manufacturing was prohibited. This system was soon found to be disadvantageous, since it tended to debar the less wealthy class of individual colonists. In 1640 the charter was modified and extended to any good citizen of the Netherlands. The system gave New York, during the colonial period, a sort of landed aristocracy. The first and largest of numerous patroonships was Rensselaerswyck, a property which remained in the Rensselaer family until the middle of the 19th century. The charter of 1640 limited the period of settlement to three years, removed the prohibition against manufactures and limited the extent of land grants to four miles along the coast or rivers and eight miles into the interior. Under the English régime some of the regulations of the system were changed, and after 1775 the patroons, or "Lords of the Manor," became merely landed proprietors. The system occasioned some trouble between landlord and tenant, which culminated in 1839 in the anti-rent agitation (q.v.). Consult Alexander, D. S., 'Political History of the State of New York' (3 vols., New York 1906-09); O'Callaghan, E. B., 'History of New Netherlands' (2 vols., New York 1846).

PATTAN, -pa-tān' (incorrectly **PATAN**, **PATN**, **PUTTUN**, or **PATHAN**: Hindustani, 'city'), a common city name in eastern India. The two most important towns of this name are Pattan in Baroda, on the Sarasvati, in the province of Gujarat, Bombay presidency, with a large fraction of its population composed of Jains, who have 108 temples in this sacred city. Swords, lances and knives are made here, as well as a very beautiful sort of pottery. Pop. about 40,000. Pattan in Nepal, on the south bank of Baghamati, two miles southeast of Katmandu, has many beautiful ruined palaces and temples and a population of about 30,000. It was formerly the capital city of Nepal.

PATTEE, păt-tē', **Fred Lewis**, American educator: b. Bristol, N. H., 22 March 1863. He was graduated A.B., Dartmouth, 1888; M.L., Dartmouth, 1915; Litt.D., Lebanon Valley College, 1915. He studied also at the universities of Göttingen, Edinburgh and Marburg and has been head of the department of English, Pennsylvania State College, since 1894. He is the author of 'A History of American Literature' (1896); 'The Foundations of English Literature' (1900); 'The Elements of Religious Pedagogy' (1909); 'A History of American Literature since 1870' (1915); three novels: 'Mary Garvin' (1902); 'The House of the Black Ring' (1905); 'The Breaking Point' (1911); and edited the 'Poetical Works of Philip Freneau' (3 vols., 1902-07).

PATTEN, **George Washington**, American soldier and poet: b. Newport, R. I., 25 Dec. 1808; d. Houlton, Me., 28 April 1882. He was graduated from Brown University in 1825, from West Point in 1830, served in the Seminole wars and in the war with Mexico, and was brevetted major for gallantry at Cerro Gordo where he lost his hand. He served on various military commissions during the Civil War until 1864 when he was retired with the rank of lieutenant-colonel. As a poet he earned the title "poet-laureate of the army." Among his lyrics are the well-known 'Seminole's Reply'; 'Joys that We've Tasted'; 'Episode of the Mexican War.' He also published 'Artillery Drill' (1861); 'Cavalry Drill and Saber Exercise' (1863); 'Voices of the Border,' poems (1867).

PATTEN, **James A.**, American grain speculator: b. Freeland Corners, Ill., 8 May 1852. He was employed in the State Grain Inspection Department at Chicago in 1874-78 and afterward engaged in business as a grain commission merchant. He was mayor of Evanston, Ill., 1901-05. He attracted worldwide attention and much hostile criticism by his attempt in 1909 to corner the wheat market, and as late as 1911 his appearance at his firm's Liverpool headquarters placed him in danger of being mobbed.

PATTEN, **Simon Nelson**, American economist and sociologist: b. Sandwich, Ill., 1 May 1852. He was educated at Northwestern University, Illinois, and the University of Halle, Germany, taking the degree of Ph.D. at Halle in 1878. On his return to the United States he taught in the public schools, and in 1888 became professor of political economy at the University of Pennsylvania. He has contributed to sociological journals and written 'Premises of Political Economy' (1885); 'Economic Basis

of Protection' (1890); 'Theory of Dynamic Economics' (1892); 'Theory of Social Forces' (1896); 'Development of English Thought' (1899); 'Theory of Prosperity' (1902); 'Heredity and Social Progress' (1903); 'New Basis of Civilization' (1907); 'Product and Climax' (1909); 'Social Basis of Religion' (1911); 'Reconstruction of Economic Theory' (1912). As a writer he is suggestive, brilliant and original, but some of his conclusions are regarded as unusual and are not accepted by sociologists; he has, however, advanced some theories of acknowledged value, particularly in his study of the dynamic forces of society, his discussion of value and price, and of the relation of distribution to consumption, etc.

PATTEN, **William**, American zoologist: b. Watertown, Mass., 15 March 1861. He was graduated at the Lawrence Scientific School, Harvard, in 1883, and afterward studied at Leipzig. He was assistant in Lake Laboratory, Milwaukee, in 1886-89; professor of biology at the University of North Dakota in 1889-93; and has been professor of zoology at Dartmouth since 1893. Author of numerous scientific papers in American and German periodicals, and of 'The Evolution of the Vertebrates and Their Kin' (1912).

PATTERN, in *decorative art*, a unit of design used as a model for more or less repetition. It is also used to signify the whole body of ornament covering a given surface. Thus a paper hanging for walls or a piece of textile fabric or an inlaid floor is decorated according to a pattern, or with a pattern, which will be laid out according to a general design including many minor parts. The colored plate gives many patterns of different epochs intended to be carried out in many different materials from which, indeed, the examples have been taken. Thus Figs. 1, 2, 3 and 5 are from Chinese and Japanese enameling on metal. Fig. 4 is a Japanese painted pattern, but the same pattern is carried out in enameled inlay and by piercing a thin board and the like. Figs. 6, 7 and 8 are from Indian and Persian manuscripts, the decorative accompaniment of the lettering, and very similar patterns are found in Oriental glazed tiles. Fig. 9 is from an Indian lacquered box; for the Indian work of this kind, though immeasurably inferior to the Japanese in finish and perfection of make, has often beautiful patterns applied to it. Fig. 10 is a Persian Niello, that is to say, an inlay of black upon a ground of white metal; the ground in this case being mainly cut away so that the black insertion covers most of the field. Fig. 11 is the corner of a Persian carpet; and this composition of conventional flowers should be compared with Fig. 6, that the reader may see this illustration of the wonderful skill of the Persians in such design. The Persians have always been the most able composers of flower patterns and leaf patterns in which natural forms are not closely followed, but artistically conventionalized. Figs. 12 and 13 are from Persian enameled pottery, tiles and the like, and here again the power of this race over floriated design is seen. Fig. 14 is from a French inlay of wood, light upon dark, of the 17th century, and Fig. 15 is a later piece of work of the same character, though here the veining of the wood is allowed to affect the general composition of the pattern.

Figs. 16 and 21 are pieces of French embroidery of the 17th and 18th centuries, the patterns being wrought with a needle upon the black and buff backgrounds. Fig. 17 is a painted cartouche, perhaps intended for an heraldic escutcheon, though the bearings have not been put in. Fig. 18 is a wall decoration in color from the Chateau of Versailles. Fig. 19 is a piece of inlaid marble work of the 17th century. Fig. 20 is taken from a piece of Rouen ware, the most decorative variety of French faience and the earliest to reach artistic perfection, dating from the 17th century. Fig. 22 is from a gilded and embossed leather wall hanging, and Fig. 23 from an embroidered wall hanging, each of the 17th century and probably of French origin, though the leather hangings of Spain are the more celebrated. Fig. 24 is from a piece of French porcelain of the 18th century, not from the royal manufactory of Sèvres, but from one of the private manufactories of the time in which beautiful work was done. Figs. 25, 26 and 27 are textile fabrics of the 17th and 18th centuries. Such pieces were made for furniture covering and for curtains, but very similar patterns were woven on a small scale and in heavy and solid silk for ladies' wear. Finally, Fig. 28 is a pilaster or stile of the wood-work in a drawing-room, painted in delicate flower patterns directly upon the wood.

RUSSELL STURGIS.

PATTERSON, Carlile Pollock, American scientist and superintendent of United States Coast Survey: b. Shieldsboro, Miss., 24 Aug. 1816; d. Washington, D. C., 15 Aug. 1881. He was a son of Daniel Tod Patterson (q.v.), and entered the navy as midshipman in 1830. He served with the Mediterranean squadron until 1835, when he went to Georgetown University to study civil engineering. He was graduated in 1838 and was appointed to the Coast Survey. He afterward served for a time at sea, attained rank as lieutenant in 1841, and in 1845 returned to the Coast Survey and was placed in command of a hydrographic party in the Gulf of Mexico. He retired from the navy in 1850, and became captain of the Pacific mail steamer *Oregon*. In 1861 he returned to the Coast Survey, of which he became superintendent in 1874. The work was extended to a general geodetic survey under his supervision.

PATTERSON, Daniel Tod, American naval officer: b. on Long Island, N. Y., 6 March 1786; d. Washington, D. C., 15 April 1839. He entered the navy as a midshipman in 1800, was attached to the frigate *Philadelphia* under Captain Bainbridge, and was captured when that vessel was overhauled by a flotilla of Tripolitan gunboats after striking a reef in 1803. He remained a prisoner until 1805, and in 1807 received the rank of lieutenant, becoming master-commandant in 1813. He commanded the United States naval forces at New Orleans in 1814 and greatly assisted General Jackson in the defense of the city, receiving the thanks of Congress for his services. He captured the pirate Lafitte (q.v.) and destroyed his defenses on the island of Barataria. In 1826-28 he commanded the *Constitution*, was navy commissioner in 1828-32, commanded the squadron in the Mediterranean in 1832-36, and

was then transferred to the command of the navy yard at Washington.

PATTERSON-BONAPARTE, Elizabeth, an American woman who became the wife of Jerome Bonaparte and played a part in the modern history of France. See BONAPARTES OF BALTIMORE.

PATTERSON, James Colebrooke, Canadian lawyer and statesman: b. Armagh, Ireland, 1839. He went to Canada in 1857 and became a barrister in 1876, engaging in practice at Windsor. He was a member of the Canadian House of Commons in 1874-95, and in 1891-95 he was Secretary of State and Minister of Militia and Defense. In 1895-1900 he was lieutenant-governor of Manitoba and Keewatin.

PATTERSON, Joseph, American banker: b. near Norristown, Pa., 25 Sept. 1808; d. Philadelphia, Pa., 25 Sept. 1887. He became a banker and during the Civil War, through his influence, the bankers of the country made a loan of \$50,000,000 in gold to Secretary Chase, at the famous conference in New York, and \$100,000,000 more in the year following. Secretary Chase constantly sought his advice on the financial policy of the administration. He was twice tendered the office of comptroller of the United States treasury which he declined as he did also the offer of the post of assistant-treasurer at Philadelphia. He was president of the Philadelphia Clearing-House Association from 1869 until his death.

PATTERSON, Robert, American soldier and educator: b. near Hillsborough, County Down, Ireland, 30 May 1743; d. Philadelphia, Pa., 22 July 1824. He came to America in 1768 and settled in Pennsylvania, where he engaged in teaching, and in 1774 was principal of the academy at Wilmington, Del. He volunteered in the Federal army at the outbreak of the American Revolution, and rose to the rank of brigade-major. In 1779 he was appointed professor of mathematics in the University of Pennsylvania, in which office he remained for 35 years, acting as vice-provost in 1810-13. In 1799 he was chosen president of the select council of Philadelphia, and in 1805 was appointed director of the mint by President Jefferson. He published 'The Newtonian System' (1808); a treatise on 'Arithmetic' (1819); edited various works on mathematics and physics.

PATTERSON, Robert, American pioneer: b. Pennsylvania, 1753; d. near Dayton, Ohio, 5 Aug. 1827. He removed to Kentucky in 1775 and assisted in the construction of the fort at Royal Spring (now Georgetown), in defense of which he afterward fought bravely. In 1776 he was one of seven men who made the daring expedition to Fort Pitt in quest of ammunition, receiving on the return trip a severe wound from a skirmish with the Indians in which all the party were either killed or wounded. He fought under Daniel Boone at the battle of Lower Blue Lick, being second in command; was colonel in the Miami expedition of 1782, and served under Logan in his expedition against the Shawnees in 1786. He built the first house in Lexington, Ky., in 1779, owned one-third of the city of Cincinnati, Ohio, when laid out (1788), and founded Dayton, Ohio (1804). Consult

Patterson, J. H., 'Concerning the Forefathers' (1903).

PATTERSON, Robert, American soldier: b. Cappagh, County Tyrone, Ireland, 12 Jan. 1792; d. Philadelphia, Pa., 7 Aug. 1881. He came to America when very young with his parents who settled in Philadelphia. He served in the War of 1812, afterward became a prominent merchant of Philadelphia, and was one of the "five Colonel Pattersons" who nominated Jackson for the Presidency. He organized, in President Jackson's honor, the great civic parade held in Philadelphia in 1833, and in the Mexican War served with distinction. He had already been commissioned major-general of volunteers in 1846, and in the latter war he commanded a division at Cerro Gordo, and directed the cavalry pursuit of the retreating Mexicans, backed up by infantry; and he finally occupied Julapa. At the outbreak of the Civil War he was mustered into service as major-general of volunteers and placed in command of the Department of Washington, where he rendered excellent service in training the raw recruits. He was retired in July 1861. In 1865 he published 'A Narrative of the Campaign in the Valley of the Shenandoah' in explanation of his conduct of affairs, which received much attention and went far toward clearing away the censure to which he had been subjected for his conduct in that campaign.

PATTERSON, Robert Mayne, American Presbyterian clergyman: b. Philadelphia, 17 July 1832; d. 1912. He was official reporter of the United States Senate (1850-55), and was graduated from Princeton Theological Seminary in 1859. He held Presbyterian pastorates in Pennsylvania, and edited *The Presbyterian* (1870-80) and *The Presbyterian Journal* (1880-93). He was a member of 13 general assemblies of the Presbyterian Church; and was author of measures consolidating the synods and enlarging their powers (1880). He was also a member of the Pan-Presbyterian Councils held at London (1875); Philadelphia (1880); and Belfast (1884). Among his works are 'What is our Duty' (1863); 'Character of Abraham Lincoln' (1864); 'Great Valley Presbyterian Church' (1869); 'Revival Councils' (1871); 'Presbyterianism in Philadelphia' (1873); 'The Apostolic Church' (1874); 'Our National Religion' (1876); 'Pre-Millennialism' (1877); 'Elijah the Favored Man' (1880); 'Isaiah and the Higher Critics' (1889); 'William Blackwood' (1894); 'American Presbyterianism' (1896).

PATTERSON, Robert Wilson, American journalist, editor and publisher: b. Chicago, Ill., 30 Nov. 1850; d. 3 April 1910. He was graduated at Williams College in 1871. He became a reporter on the *Chicago Times* after the great fire, and in 1873 became assistant night editor on the *Chicago Tribune*, subsequently acting as Washington correspondent, editorial writer, managing editor and succeeding Joseph Medill as editor-in-chief of the publication, as well as being president of the company.

PATTERSON, Thomas MacDonald, American lawyer, editor and politician: b. Carroll County, Ireland, 4 Nov. 1839; d. Denver, Colo., 23 July 1917. His family emigrated to America in 1849, and he was sent to Asbury College and later to Wabash College. Ad-

mitted to the bar, he set up a practice at Denver, where he was also for many years editor-in-chief of the *Rocky Mountain News* and the *Denver Times*. He was city attorney for Denver in 1874; last territorial delegate from Colorado to the 44th Congress (1875-77); a member of the 45th Congress (1877-79) and member of the Democratic National Conventions of 1876, 1888 and 1892. In 1888 he was also Democratic candidate for governor and a delegate to the Populist National Conventions of 1896 and 1900. From 1901-07 he was United States senator, and was again nominated for governor in 1914.

PATTERSON, La., town in Saint Mary Parish, on the Atchafalaya River, 87 miles southwest of New Orleans, on the Southern Pacific Railroad. Lumber and sugar constitute the chief interests of the town. There are modern waterworks, a high school and a hospital. Pop. 2,998.

PATTESON, pāt'e-sōn, John Coleridge, English missionary and martyr: b. London, 1 April 1827; d. island of Nukapu, Melanesia, 20 Sept. 1871. He was educated at Eton and Oxford, was elected Fellow of Merton in 1852 and in 1853 was appointed curate of Alington, Devonshire. In 1855 he sailed with Bishop Selwyn to New Zealand, and the next 16 years were spent in missionary labors in the Melanesian and other South Sea islands. He was consecrated bishop of Melanesia in 1861. He was greatly beloved by the Melanesians, whom he protected to his utmost against the white kidnappers of the Pacific. He was killed by the natives of Nukapu, one of the Santa Cruz group, in revenge, it is supposed, for relatives carried away by the white slavers. He is said to have spoken over 20 languages and dialects. He made translations from the Bible into the Mota language. Consult Yonge, C. M., 'Life of John Coleridge Patteson' (1874); Awdry, Frances, 'The Story of a Fellow Soldier' (1875).

PATTI, pāt'ē, Adelina Maria (originally ADELA JUANA MARIA), Italian singer: b. Madrid, Spain, 19 Feb. 1843; d. Wales, 27 Sept. 1919. She was brought up in New York, where she was trained by Strakosch, who married one of her elder sisters, Amelia. Her wonderful voice, when she was only in her seventh year, saved her family from poverty. It was nearly ruined by overwork, however, and she only retired from the concert stage in time to save it. On 24 Nov. 1859 she made her début in opera in New York as Lucia, and on 14 May 1861 in London as Amina, going in the next year to Paris, where she stayed until 1870, singing at the same time in Italian opera in London and Madrid. Her success everywhere was tremendous, partly because of her personal grace and charm, but mostly due to her pure style and her clear, pure-toned voice, which had wonderful range. The Italian operas in which she most frequently sang were 'Son-nambula,' 'Lucia di Lammermoor,' 'Il Barbiere di Siviglia,' 'Don Pasquale,' 'La Traviata,' 'Rigoletto,' 'Don Giovanni,' 'Il Trovatore,' 'I Puritani' and 'Ernani.' She occasionally sang Wagnerian songs in concert. In November and December 1903 she made an American concert tour, which was a great financial success, and which showed that her vocal powers were

only slightly impaired. She married 1868 the Marquis of Caux, equerry to Napoleon III, left him in 1877, was divorced in 1885, and married in June 1886 the tenor Niccolini, after whose death, 18 Jan. 1898, she married in 1899 Baron Cederstrom, with whom she lives at Craig-y-Nos, in Wales.

PATTI DE MUNCK, Carlotta, Italian concert singer, sister of Adelina Patti (q.v.): b. Florence, 1840; d. Paris, 27 June 1889. She was first trained as a pianist, but devoted herself to vocal music, and in 1861 appeared in concert in New York; her lameness prevented her from staying on the operatic stage. She sang in London in 1863, made several tours in Europe and America, and 3 Sept. 1879 married Ernest de Munck, a violoncellist. Her execution was excellent, and her voice a remarkably high and flexible soprano.

PATTI, Sicily, town in the province of Messina, on the north coast of the island, 42 miles by rail southwest of Messina. There is a cathedral dating from 1300, in which is the tomb of Adelasia, mother of Count Robert of Sicily. There are sandstone quarries in the neighborhood and the town has a shipping trade in olive oil, flour and fish. Industries include silk mills and potteries. Pop. commune 10,535; town 5,604.

PATTISON, păt'i-sôn, Dorothy Wyndlow, best known as "SISTER DORA," English nurse: b. Haukswell, near Richmond, Yorkshire, 16 Jan. 1832; d. Walsall, Staffordshire, 24 Dec. 1878. She was a sister of Mark Pattison (q.v.). In 1864 she entered a Church of England Sisterhood of the Good Samaritan at Coatham, adopting the name of "Sister Dora." The next year she was sent as nurse to a cottage hospital at Walsall. She at once endeavored to render herself a good surgical nurse, and from 1867 to 1877 was in sole charge of a new hospital at Walsall, built in 1867. She resigned in February 1877, in order to take charge of the municipal epidemic hospital at Walsall. She shrank from no labors, however difficult or repulsive, and her natural qualifications as a nurse were reinforced by the skill she acquired in surgery. She was greatly beloved by the poorer classes among whom she labored, and in her memory a window was placed in the Walsall parish church and a statue of her erected in Walsall in October 1886. Consult Lonsdale, Margaret, 'Sister Dora' (1880); Ridsdale, Elen, 'Sister Dora' (1880).

PATTISON, James William, American painter and author: b. Boston, Mass., 14 June 1844; d. 29 May 1915. He enlisted in the United States army in 1863 and rose to the rank of sergeant before his discharge in 1865. He received his art education under James M. Hart, R. S. Gifford and George Inness in New York, and under Albert Flamm in Düsseldorf, and Luigi Chialivia in Paris. He painted a wide number of subjects including figures, domestic animals, landscapes and marines. He exhibited at the Paris Salon in 1879-81 and for many years at the National Academy and American Water Color Society in New York and the Pennsylvania Academy of Fine Arts and the Art Institute of Chicago, as well as in other exhibitions throughout the United States. He received a medal at the Saint Louis Exposition

in 1904. He was director of the School of Fine Arts, Jacksonville, Ill., in 1884-96; and from 1896 was faculty lecturer on the collections at the Art Institute of Chicago. He also edited the *Fine Arts Journal*, Chicago, from 1910. Author of 'Painting in the Seventeenth and Eighteenth Centuries' (1901); 'Painters Since Leonardo' (1904).

PATTISON, Mark, English scholar and clergyman: b. Hornby, Yorkshire, 10 Oct. 1813; d. Harrowgate, Yorkshire, 30 July 1884. He was educated at Oxford, and in 1839 became a Fellow of Lincoln College, Oxford. In 1843 he took priest's orders in the English Church and was appointed a tutor in Lincoln College the same year. He was at this time a follower of Newman, but presently drifted away from Tractarianism and became in his later years an extremely liberal member of the Anglican communion. In 1861 he became rector of Lincoln College and engaged actively in the work of university reform, and under him his college developed its resources and came into prominence in the university. He was a most thorough scholar, but often caustic in speech and always impatient of anything like pretense. He spent considerable time in Germany in literary research and was curator of the Bodleian Library and the Taylor Institutions. He had in view for a long time the writing of a history of learning, but of this only fragments were written. To the famous book 'Essays and Reviews' he contributed 'Tendencies of Religious Thought in England 1688-1750,' and he was the author of 'Suggestions on Academic Organization' (1868); a 'Life of Isaac Casaubon' (1875), his principal work; 'Life of John Milton' (1879), which has often been reprinted; 'Sermons' (1885); 'Memoirs' (1885), a somewhat morbid piece of autobiography extending only to 1860. Consult Morley, John, 'Critical Miscellanies' (Vol. III, London 1892); Tollemache, 'Recollections of Pattison' (1885).

PATTISON, Robert Emory, American politician: b. Quantico, Md., 8 Dec. 1850; d. Philadelphia, Pa., 1 Aug. 1904. He was admitted to the bar in 1872 but soon turned his attention to politics, and in 1877-82 was city comptroller of Philadelphia. Owing to a split in the Republicans, in 1882 he was elected governor of Pennsylvania, although his party was in the minority, and served four years when he resumed his law practice. He was president of the Chestnut Street National Bank, of the United States Pacific Railway Commission in 1887-90 and in 1891-95 again served as governor of his State.

PATTISON, Robert Everett, American Baptist clergyman and educator: b. Benson, Vt., 9 Aug. 1800; d. Saint Louis, Mo., 1874. He was graduated at Amherst College in 1830, was tutor in Columbian College, Washington, D. C., for a year, and afterward was professor of mathematics at Waterville College, Maine. He was ordained in 1833 and held charges at Salem, Mass., and at Providence, R. I. In 1836-39 he was president of Waterville College, and subsequently was pastor at Saint Louis, and at Providence. He was president of the Western Baptist Theological Seminary at Covington, Ky., in 1845-48; professor at the Theological Seminary at Newton, Mass., in 1848-54; and in

1854-57 was again president of Waterville College. He was afterward professor of theology at Shurtleff College, Alton, Ill., and at the Union Baptist Theological Seminary, Chicago. Author of 'Commentary on the Epistle to the Ephesians' (1859).

PATTISON, Thomas Harwood, American Baptist clergyman: b. Cornwall, England, 14 Dec. 1838; d. Rochester, N. Y., 13 Feb. 1904. He was graduated from Regent's Park College, England, in 1862, came to the United States, and last occupied the chair of homiletics and pastoral theology at the Rochester Theological Seminary. He published 'Present Day Lectures' (1872); 'The History of the English Bible' (1894); 'The Ministry of the Sunday School' (1902).

PATTON, Francis Landey, American educator and theologian, 12th president of Princeton University: b. Warwick, Bermuda, 22 Jan. 1843. He was educated at Knox College, Toronto, the University of Toronto and at Princeton Theological Seminary, where he was graduated in 1865. He was pastor of the 84th Street Church, New York, 1865-67, of the Nyack Presbyterian Church 1867-71, of the South Church, Brooklyn, 1871, and of the Jefferson Park Presbyterian Church, Chicago, 1874-81. While in Chicago he edited the *Interior*, a religious weekly; was professor of theology in the Presbyterian Theological Seminary, and was prominent in the anti-heresy movement in the Presbyterian Church, being prosecutor of Prof. David Swing (q.v.). He was moderator of the Presbyterian General Assembly in 1878. In 1886 he was elected professor of ethics at Princeton College, having removed to Princeton in 1881 to occupy a chair in the Theological Seminary, endowed by Robert L. Stewart and styled "Relations of Philosophy and Science to the Christian Religion." In 1888 he was chosen president of Princeton University, then called the College of New Jersey, but adopting the title of university in 1896. His admiration was marked by great growth in the wealth and numbers of students of the university. In 1902 he resigned, and a few months later was elected president of Princeton Theological Seminary. In 1891-92 he was prominent in the opposition within the Presbyterian Church to the action of Union Theological Seminary in upholding Dr. Charles A. Briggs (q.v.), who was accused of heresy. He has published 'The Inspiration of the Scriptures' (1869); 'Summary of Christian Doctrine' (1874), and many papers on philosophical and theological subjects.

PATTON, Frank Jarvis, American soldier and inventor: b. Bath, Me., 1852; d. New York, 12 Nov. 1900. After graduation from West Point in 1877, he was assigned to the 21st Infantry, rose to the rank of 1st lieutenant in 1884, and resigned from the service in 1889. He experimented much with electricity, and was the inventor of the multiplex telegraph system. Among other devices of his was that of the gyroscope, used to determine the position of vessels in mid-ocean.

PATTON, Jacob Harris, American historian: b. Fayette County, Pa., 20 May 1812; d. 1903. He was graduated from Jefferson College, Pennsylvania, in 1839, and from Union Theological Seminary in 1846. He was tutor in Union Seminary in 1843-46, in Nashville

University 1840-43 and in the New York Classical School in 1846-87. Among his publications are 'A Concise History of the American People' (1869-82); 'Yorktown, 1781-1881' (1882); 'Natural Resources of the United States' (1888); 'Political Parties in the United States' (1902).

PATTON, Pa., borough in Cambria County, 65 miles northeast of Pittsburgh, on the Pennsylvania and New York Central railroads. It has agricultural, coal mining and coke interests and manufactures bricks and fire-clay products. Pop. 3,628.

PATUXENT, pa-tuks'ent, a river of Maryland, which rises in the north of the State about 20 miles east of the city of Frederick, flows southeast and then south and empties into Chesapeake Bay through a large estuary. It is 90 miles long, is navigable for almost 50 miles and contains oyster beds of great value.

PATZCUARO, pätz'kwä-rō, Mexico, city in the state of Michoacán, 30 miles southeast of Morelia and a little southeast of the lake of the same name, on the shores of which was the city of Tzintzuntzan, the capital of the Tarascs and the centre of the great Michoacán Empire. The present city, 7,500 feet above sea-level, occupies much the same site. It is an old and picturesque town. It contains the tomb of Vasco de Quiroga, an early bishop of Michoacán and missionary to the Indians, and is famed for the handiwork of the natives, notably feather picture work, cloaks and furniture. There are sugar, tobacco and mining industries centred there. Pop. about 8,000.

PAU, pō, Paul, French general: b. Montémar, 29 Nov. 1848. He was graduated at the Military Academy at Saint Cyr in 1867, and at the outbreak of the Franco-Prussian War in 1870 he was a lieutenant in the infantry. He was seriously wounded in August of that year, losing his right arm, but returned to duty when recovered and was promoted captain in 1871 and received the Cross of the Legion of Honor. He remained with the army, became general of brigade in 1897 and of division in 1903. In 1911 he was offered the post of chief of the general staff, but declined it. He was commandant of the 16th Army corps at Montpellier and later of the 20th Army corps of Alsace, and was in charge of important operations in Alsace in the early months of the European War. He represented France on diplomatic missions to Russia, Italy and the Balkans in 1915, and in 1918 headed the French economic mission to Australia. He was a member of the Council of War in the European War and ranks among the foremost of the French military leaders of his day.

PAU, France, capital of the department of Basses-Pyrénées, on a lofty ridge on the right bank of the Gave-de-Pau, here crossed by a fine bridge, 58 miles east-southeast of Bayonne, and commanding a magnificent view of the western Pyrénées. It has several squares, notably the Place Royale, with a finely planted promenade and a marble statue of Henry IV, and the Place-de-la-Comédie, communicating with a suburb by a bridge which spans a deep ravine. The most conspicuous and interesting edifice is the castle in which Henry IV was born, crowning a lofty peak at the western extremity of the

town, and overhanging the Gave. It is a huge, angular and irregular structure, flanked with towers, of which five still remain, the highest (the Tour de Gaston-Phœbus) or dungeon having a height of 100 feet, and another, called the Tour de la Monnaie, being the traditional asylum which Margaret of Valois gave to Calvin and other persecuted reformers. The greater part of the castle was restored in good taste by Louis Philippe. Pau has a Court of Appeal for the departments of Basses-Pyrénées, Hautes-Pyrénées and Landes; courts of the first resort and commerce; an academy, college, museum, library, a winter palace, since 1896, in Beaumont Park, agricultural society and society of science, literature and art. The manufactures of Pau consist of napkins, excellent table linen, rugs, carpets, paper and leather. The trade is in wine, Bayonne hams, salt provisions, excellent chestnuts, printed cottons, iron, marble and leather. Pau has produced two sovereigns, Henry IV and Bernadotte (Charles XIV of Sweden). It is a favorite resort of the English in winter, having a mild, dry climate, with no sudden variations of temperature. It is a convenient starting-place for travelers desirous of exploring the Pyrenees. Pop. about 37,000.

PAUER, pow'ër, Ernst, Austro-English musician: b. Vienna, Austria, 21 Dec. 1826; d. 1905. He was educated in Vienna and Munich and was successful, both as a director of musical societies and in giving historical piano recitals. He was director of musical societies in Mainz (1847-51), when he went to London, where he became professor in the Royal Academy of Music in 1859. Though holding positions and doing extensive musical work in England he still retained close relationships with the Continent where he continued to give concerts and recitals to large and critical audiences. In 1866 he was appointed pianist at the Austrian court, and he lectured in England and Ireland on the history of music from 1870 until his retirement to his villa at Jugenheim near Darmstadt in 1896. He was appointed professor of the National Training School for Music at Kensington Gore in 1876; in 1878 was a member of the musical board at Cambridge and in 1879 was appointed examiner there. He edited the works of various great composers and among his operas are 'Don Riego' (1849); 'Die Brautschau Friedrichs des Grossen' (1861). Pauer may be said to have introduced the English, as a people, to German music which he made immensely popular in London and, later on, throughout Great Britain. He also did much to popularize old English musical compositions. He published 'The New Gradus ad Parnassum.'

PAUL, Saint. See SAINT PAUL.

PAUL I, Saint: d. Rome, 28 June 767. He was the successor of Stephen III, his brother, in 757. He was ably supported in his pontificate by Pepin I, king of the Franks, who assisted him in disputes with the Lombards and the Byzantine emperor, who still laid claims to the exarchate and the Pentapolis. Consult Mann, H. K., 'Lives of the Popes' (Vol. I, Part II, London 1902).

PAUL II (PIETRO BARBO, pē-ä'trō bär'bō): b. Venice, 26 Feb. 1418; d. Rome, 28 July 1471. He was a nephew of Pope Eugenius IV; became a cardinal in 1440, and exercised a very

strong influence over Nicholas V and Calixtus III. He succeeded Pius II in 1464. His first endeavor was to form an alliance of the Christian princes against the Turks, who at the time threatened to invade Italy, but in this he failed, not because his plans were not well formed and opportune, but because he was forced to oppose the claims to absolute power of Louis XI of France. He sought to stem the pagan tendencies of the Renaissance spirit, and took stringent measures against the heretical teachings of some of the Humanists of the time, even to closing the Roman Academy, which had become a hotbed of opposition to the papal claims and the progress of Christianity. Paul II promulgated very severe laws for the punishment of those scholars and others who taught pagan doctrine or practised pagan immorality. Consult Creighton, M., 'History of the Papacy' (Vol. IV, New York 1913); Pastor, L., 'History of the Popes' (Vol. III, London 1910).

PAUL III (ALESSANDRO FARNESE, ä-lës-sän'drō fär-nä'së): b. Canino, 29 Feb. 1468; d. Rome, 10 Nov. 1549. Educated in Rome under conditions which brought him into contact with the ruling class, he went to Florence where his family connections enabled him to enter into close relations with the Medici. He was made a cardinal in 1493 by Alexander VI, and subsequently became bishop of Ostia and the dean of the Sacred College, and twice represented the Pope, during his absence, as legate in Rome. He was elected to the papal chair in succession to Clement VII in 1534. He had previously urged the summoning of a council of the Church and after he became Pope called a council to meet at Mantua in 1536, at Vicenza in 1538 and at Mantua again in 1542. Disputes between Charles V and Francis I prevented the assembly of the council on each occasion, but in 1545 it met at Trent. (See TRENT, COUNCIL OF). He was a vigorous suppressor of heresy, re-established the Inquisition in Italy, approved the Order of Jesuits, condemned slavery in 1537, established a very strict censorship of books and excommunicated Henry VIII of England. He very greatly advanced the interests of the Catholic Church and did much to establish its stability. Yet he was very much of a politician and he looked after the welfare of his relatives and his natural children, one of whom, Pietro Luigi Farnese, he made Duke of Parma and Piacenza. He is remembered gratefully in Italy as a liberal and judicious patron of art; and numerous notable buildings are due to his initiative. Michelangelo was appointed by him chief architect of the Vatican and also of Saint Peter's at Rome. Consult Pastor, L., 'History of the Popes' (Vol. VIII, London 1908).

PAUL IV (GIOVANNI PIETRO CARAFFA): b. Naples, 28 June 1476; d. Rome, 18 Aug. 1559. He became archbishop of Brindisi in 1518, founded the order of secular clergy known as Theatines in 1524, was made cardinal in 1530 and in extreme old age (1555) succeeded Marcellus II. He nevertheless displayed a vigor in his pontifical office, which had not been looked for in one of his advanced age and previous studious habits. He established a censorship, completed the organization of the Roman Inquisition, undertook the alleviation of the burdens of the poor and the more vigorous

administration of justice, and also banished his own nephews from Rome on account of their dissolute life. He joined with France in the war for the conquest of Naples (1555-57) and condemned the provisions of the Peace of Augsburg. With a view to reforming undesirable conditions in the Church he established the secular clergy called Theatines (q.v.) of which he was himself the first and very active superior. When he became Pope he used all his influence to improve the morality of the lives of the clergy and of the public in general. He insisted on the restoration of church property in England; and on Queen Elizabeth's accession to the throne he declared her illegitimate and, therefore, not legally queen. He got into trouble with other rulers and at home he was very unpopular on account of his want of tact and his enforcement of his own construction of morality. Consult Van Ranke, Leopold, 'History of the Popes' (London 1908).

PAUL V (CAMILLO BORGHESI, kâ-mêl'lo bôr-gâ'sé): b. Rome, 17 Sept. 1552; d. there, 28 Jan. 1621. In the earlier part of his career he was prominent as a theologian, and in 1596 he became a cardinal. He succeeded Leo XI in 1605. He was a vigorous, able administrator and among important incidents of his pontificate were a conflict with Venice which resisted him so stoutly that he excommunicated the Doge and Senate, the establishment of the Congregation of the Oratory, and the orders of the Ursulines and the Visitation; and great activity in mission work in heathen lands. The arts also flourished under his direction. Consult Trollope, T. A., 'Life of Paul V' (1861).

PAUL I, Petrovitch, tsar of Russia, son of Peter III and Catherine II: b. 1 Dec. 1754; d. 24 March 1801. His father refused to acknowledge his legitimacy, and his mother treated him with great severity so that his naturally good disposition became morose, sullen and fitful. He succeeded her, in spite of her plans to exclude him from the throne, in 1796; removed all her favorites and punished his father's murderers. He released Kosciusko and other captive Poles, re-established the rule of male succession to the throne and bitterly opposed everything French, even suppressing pamphlets which approached Jacobin sentiments merely in containing such words as "citizen" and "society." After the French invasion of Egypt he formed an alliance with England against the republic, sending armies to Holland, Switzerland (under Khorsakoff) and Italy (under Suvaroff). The defeat of the second army followed close on the heels of the great victory of the third. Suvaroff barely escaped, and Paul, won by Napoleon's artfulness and out of humor with his English allies, who refused to surrender to him the island of Malta, to which he held title through Louis XVIII, his royal guest, now broke with the English, joined Napoleon most heartily, dismissed Louis from Russia and formed with Sweden, Denmark and Prussia the armed neutrality, which was calculated to ruin England. But his despotism at home, his demands that everybody prostrate himself before him, and the rumor that he intended to disinherit his son Alexander, roused a plot against him, to which Alexander was privy. Paul was to be forced to abdicate and Alexander would then become regent. But

when the conspirators broke into his room and bade him sign his abdication, he refused, attempted to make his escape and was killed, probably being strangled with a sash cord. Paul seems to have begun his reign with intention to govern well; but his determination to rule as arbitrary monarch soon forced him into oppressive despotism which depressed the intellectual, spiritual and military life of the nation. Suspicious beyond all his royal predecessors, Paul I developed a spy system more extensive, far-reaching and effective than anything in the same line heretofore known among the Christian nations. This was followed up by the quick, certain and relentless punishment of those found guilty of disloyalty, or even suspected of it. Thousands of innocent victims were sacrificed to the inordinate fear of treachery which possessed the monarch. Yet there are numerous evidences that Paul I took his kingly office seriously. He permitted the peasants, for the first time in history, to take the oath of allegiance to the throne, thus giving them a sort of legal recognition. He followed this up by prohibiting, in 1797, the lords from working their serfs on holidays, or more than three days a week, and the following year another decree made it illegal to sell peasants without lands in Little Russia. Paul I also separated the estates and income of the imperial family from those of the state; and he established the rule of succession to the throne whereby it should pass from father to son, and in case there were no son, to the eldest surviving brother. Consult Bienemann, 'Aus den tagen Kaiser Pauls' (1886); Schiemann, 'Die Ermordung Pauls und die Thronbesteigung Nikolaus I' (1902); Waliszewski, K., 'Paul I' (London 1913).

PAUL, Charles Kegan, English publisher and author: b. White Lackington, Somerset, 8 March 1828; d. London, 19 July 1902. He was educated at Oxford, took orders in the Church of England, was made curate of Great Tew (1851) and Bloxham (1852), and after 10 years of teaching at Eton became vicar of Sturminster, Dorsetshire. His views gradually developed a positive character, and he, therefore, withdrew from his living and became reader for the publishing-house of H. S. King, to whose business he later succeeded. His firm published many important works and the *Nineteenth Century Review*. In consequence of financial troubles the concern was transformed into a limited company, of which Paul was manager until his retirement in 1899. Toward the close of his life he entered the Roman Catholic communion. Among his works are 'William Godwin'; 'Biographical Sketches'; 'Faith and Unfaith'; 'Memories'; 'Letters of Mary Woolstonecraft'; 'Biographical Sketches'; 'Marie Drummond.'

PAUL, John. See WEBB, CHARLES HENRY.

PAUL, Lewis, English inventor: d. Brook Green, Kensington, April 1759. In 1738 he obtained a patent for a cotton and wool spinning machine, this patent comprising an invention now in use in most of the world's cotton-mills. This invention consists of two pairs of rollers, one of which revolves at a velocity greater than that of the other. Factories were established to make use of his patent in Birmingham and Northampton. His invention never brought

Paul substantial returns, and was commercially successful only when later improved by Arkwright. Among his other inventions are those of a carding-machine (1748) and another spinning-machine (1758). Paul was a correspondent of Dr. Johnson.

PAUL CLIFFORD, a novel by Bulwer, published in 1830. It derives its name from that of its hero, and the author's purpose in writing it was to appeal for an amelioration of the British penal legislation, by illustrating to what criminal extremes the ungraded severity of the laws was driving men who by nature were upright and honest.

PAUL OF THE CROSS, Saint, Italian religious, founder of the Order of Passionists: b. (PAOLO FRANCESCO DANEI) Ovada, near Genoa, 1694; d. Rome, 18 Oct. 1775. With a few associates he led a life of religious retirement on Mount Argentaro (Orbitello), where it was divinely revealed to him that he was to be the founder of an order, and even the habit was shown. The bishop of Alessandria permitted Paul to assume this habit, and, as a layman, to preach repentance. In 1727 he was ordained priest, and in 1737 established on Mount Argentaro the first Passionist settlement. Benedict XIV formerly approved the order in 1741. Paul was canonized in 1867; his day is 16 November.

PAUL-DUBOIS, pöl dou'bwä, Louis François Alphonse, French economist: b. Paris, 1868. He received his education at the Lycée Louis-le-Grand, studied law and was appointed referee at the audit office. His published works are 'Les chemins de fer aux Etats-Unis' (1896); 'Les finances communales' (1898), which won him the Fancher Prize from the Academy of Moral and Political Sciences; 'Frédéric le Grand d'après sa correspondance politique' (1902), which was awarded the Montyon Prize by the French Academy; 'L'Irlande contemporaine et la question irlandaise' (1907; English translation under the title 'Contemporary Ireland,' 1908).

PAUL PRY, a comedy by John Poole, published in England in 1825 and often attributed to Douglas Jerrold. The character from which the play takes its name is that of a meddlesome mischief-maker drawn from one Thomas Hill, a journalist.

PAUL OF SAMOSATA, a heresiarch of the 3d century. He became patriarch of Antioch in 260, and acquired great wealth. He caused the hymns of the Church to be abolished and others sung in praise of himself, and surrounded himself with a number of young and beautiful women. In defiance of the ecclesiastical canons he held the office of *ducenarius*, a sort of procuratorship under the emperor. He was a friend of Zenobia, queen of Palmyra, an admirer of his eloquence. He taught that there was only one God, who is the Father; that the Word or Wisdom of God was not a substance or person, but was in the divine mind as reason in men; that Christ was a mere man who acquired this Word or Wisdom of God, becoming by it both God and the Son of God, though both in an improper sense, and gradually acquiring his knowledge and virtues. His opinions were condemned in a council held about 264. Failing, however, to retract them he was

deposed at the Council of Antioch in 269. He passed the latter years of his life in obscurity. Consult Harnack, Adolf, 'History of Doctrine' (translated into English by Neil Buchanon, Boston 1898).

PAUL OF THEBES, Saint, early Christian hermit: b. Thebes, Upper Egypt, 228 A.D.; d. 340. He is the first well-known Christian hermit, as distinguished from the still earlier ascetics, of whom very little is known. Saint Jerome credits him with being the founder of monasticism. In 250 A.D., during the Decian persecution, he retired to a desert cave, and there lived until his death, a near-by spring and palm supplying him with food, clothing and shade. In later years ravens are said to have ministered to him, as to Elijah. He received in his seclusion Saint Anthony, whom he trained to become his successor in the establishment of the hermit life. Jerome wrote his life, and rejected as incredible many of the fabulous tales told regarding him, which could scarcely have been more remarkable than those still narrated. His day in the Roman Catholic Church is 15 January. Consult his life by Joseph Bidez.

PAUL OF VENICE, or **BROTHER PAUL** (Fra Paolo). See SARPI, PAOLO.

PAUL VERONESE. See VERONESE, PAOLO.

PAUL ET VIRGINIE (Paul and Virginia), the novel which made Bernardin de Saint Pierre famous and has caused many tears to flow since its publication in 1787, is the romance of two children of same age brought up according to nature by their families living in the tropical Ile de France (Mauritius). Their childhood affection, grown later into love, is further intensified during a separation caused by Virginie's trip to France; and after she perishes in the wreck of the ship which was bringing her back to the island and to Paul, he soon dies of a broken heart. This little work is the symbol of the ideals of a peaceful Utopia which the author had vainly tried to realize during his wanderings in early life. Friend and disciple of Rousseau, he was greatly influenced by the latter's ideas and even by his style. In 'Paul et Virginie' are found many imitations of 'La Nouvelle Héloïse,' and Bernardin de Saint Pierre continues Rousseau's philosophy in contrasting natural goodness and social corruption. The novel, hardly more than a sketch, has little plot and is lacking in power of analysis or character study; it is besides encumbered with many sentimental dissertations on nature, the simple life, virtue, love, misfortune, death, etc. Withal it has a charm of its own which comes from a touching picture of childhood life with its joys and its sorrows, expressed in a style full of local color. Descriptions of nature in the tropics with its luxurious vegetation, brilliantly colored birds, perfume-laden flowers and strange harmonies, contributed largely to the success of the book and reveal the author as a master painter, the first "artist" writer in French literature. Because of his influence on Chateaubriand and Lamartine, Bernardin de Saint Pierre is considered as one of the precursors of Romanticism.

LOUIS A. LOISEAUX.

PAULANITES. See ORDERS, RELIGIOUS.

PAULDING, päl'ding, Hiram, American naval officer: b. New York, 11 Dec. 1797; d. Huntington, N. Y., 20 Oct. 1878. He entered the navy in 1811, distinguished himself in the War of 1812, particularly at the battle of Lake Champlain. After the war he served on the *Constellation* of Decatur's squadron against the Barbary powers; in 1822-23 he was 1st lieutenant of the *Sea Gull*, said to be the first steam-vessel used in war, in an expedition by Porter against West Indian pirates; and he was made captain in 1844, after which he cruised for three years (1844-47) in the sloop *Vincennes* in East Indian waters. He commanded at the Washington navy yard in 1851-54, and in 1854-57 was in command of the home squadron. In December 1857 he arrested William Walker (q.v.), the filibuster, at Greytown, Nicaragua. He acted without instructions, and his conduct in apprehending Walker on foreign soil was not approved by President Buchanan, who relieved him of his command. The republic of Nicaragua, however, presented to him a sword, and offered also a large tract of land, which the United States government did not allow him to accept. On the outbreak of the Civil War he was called by Lincoln to Washington to assist Secretary Welles in putting the navy in trim; and in April 1861 he destroyed the navy yard at Norfolk, Va., to prevent its valuable stores from falling into the possession of the Confederates. He was technically retired in 1861 on the age limit; but in 1862-66 was commandant at the New York navy yard; in 1866-69 governor of the naval asylum at Philadelphia, and in 1870-71 port-admiral at Boston. He was promoted rear-admiral on the retired list in 1862. He wrote 'Journal of a Cruise Among the Islands of the Pacific' (1831). Consult Meade, R. P., 'Life of Hiram Paulding' (New York 1910).

PAULDING, James Kirke, American author: b. Nine Partners, Dutchess County, N. Y., 22 Aug. 1779; d. Hyde Park, N. Y., 6 April 1860. At 19 he went to New York, the home of his brother William, and of William Irving, who had married Paulding's sister and who was the means of his acquaintance with Washington Irving. In 1807 the two Irvings and Paulding brought out the first copy of *Salmagundi*, a satiric literary periodical, which met with immediate success, but was discontinued at the end of a year, when the publisher refused to pay the authors. Paulding was not, however, dependent on his writings for support as he held a public office in New York City. In 1812 he gained fresh praise by a spirited national satire, 'The Diverting History of John Bull and Brother Jonathan,' which allegorizes the difficulties between Great Britain and the United States. The same theme was cleverly treated in prose in a pamphlet called 'The United States and England,' which brought him the post of secretary to the board of navy commissioners. Much of his time and energy were spent in writing editorials for the New York *Evening Post* and in other political hackwork, and many of his literary ventures during this time were of little value and had small success. This is notably true of 'The Backwoodsman' (1818), an epic of pioneer life, and of a new series of *Salmagundi* (1819). But in the lighter vein of

humor and fiction he was more at home; 'Köningsmarke,' a story of the early Swedish settlers (1823), 'John Bull in America, or the New Munchausen' (1824), 'The Merry Tales of the Three Wise Men of Gotham' (1826), a 'Chronicle of the City of Gotham' (1830), and the very successful story, 'The Dutchman's Fireside,' are the best of his works. From 1825 to 1837 he was navy agent at the port of New York, and in the latter year became Secretary of the Navy, in which position he stubbornly opposed the introduction of steam-driven vessels into the navy. He retired in 1841, published a Revolutionary novel called 'The Old Continental' (1846), 'American Comedies' (with his son, William Irving Paulding, 1847), and 'The Puritan and His Daughter' (1849), another historical novel. His verse was mediocre, the tongue-twisting lines beginning 'Peter Piper picked a peck of pickled peppers,' which appeared in 'Köningsmarke,' being his surest claim to poetic fame. As a politician he was very conservative; his 'View of Slavery in the United States' defends the institution. His true literary strength lay in his fund of original humor. His selected works (1867-68) and his 'Literary Life' (1867) were edited by his son, William Irving Paulding.

PAULDING, John, American soldier: b. New York, 1758; d. Staatsburg, N. Y., 18 Feb. 1818. He enlisted in the Federal army at the outbreak of the American Revolution, served through the war and was three times taken prisoner. His fame rests upon his being one of the captors of Major André, for which service to the American cause he received a silver medal from Congress and a pension of \$200. A monument was erected over his remains at Peekskill, N. Y., in 1827 by the city of New York, and the monument erected at Tarrytown, N. Y., on the spot of the famous capture has the figures of Paulding and his companions reproduced in the act of searching André for the secreted papers.

PAULICIANS, pâ-lîsh'anz, Manichæans and Gnostics who in the 8th century assumed the name of Paulicians, from Paul of Samosata, bishop of Antioch, their leader, to save themselves from persecutions, according to one view of their origin. Recent investigation, however, would seem to show that the Paulicians had an independent origin. As iconoclasts they were favored or persecuted by the Greek emperors according as the latter were favorable or otherwise to the worship of the images, which the Manichæans totally rejected. In the 9th century they were subjected to violent persecution. Many of them were put to death; others fled to Mohammedan countries. When the Crusaders had opened a way to the middle of Europe, companies of this sect passed as pilgrims from the Holy Land up the Danube, and entered Italy with the Levant trade through Venice. The Vaudois and Albigeois sects (Waldenses and Albigenses) are said to have sprung from this stock. Such is the account given of them by Photius and Petrus Siculus, but a different view has been taken by modern ecclesiastical historians. According to these writers the sect was founded by one Constantine of Mananalis, who conceived so great a veneration for the Apostle of the Gentiles that he assumed his name. They rejected the

adoration of the Virgin and the saints, and refused homage to the cross; they denied the validity of the sacraments, interpreting spiritually baptism and the Lord's Supper; would not recognize any priestly dignity; and their public worship was altogether free from ritual. In the 9th century under Baanes, the Paulicians became very active and this led to the persecution already noticed. A remnant of this sect is said by a modern Greek historian to have survived at Philippopolis to the beginning of the 19th century, and many still existed in Armenia at this latter date. See RELIGIOUS SECTS. Consult Adeney, W. F., 'Greek and Eastern Churches' (New York 1908); Conybeare, F. C., 'The Key of Truth' (the book of the Paulicians, Oxford 1898); Gibbon, Edward, 'Decline and Fall of the Roman Empire' (Vol. VI, London 1912); Lynch, H. F. B., 'Armenia' (London 1901); Newman, A. H., 'Manual of Church History' (Philadelphia 1900).

PAULINE EPISTLES, the name by which 13 books of the New Testament are commonly known, namely, Romans, 1 and 2 Corinthians, Galatians, Ephesians, Philippians, Colossians, 1 and 2 Thessalonians, 1 and 2 Timothy, Titus and Philemon. A 14th book, the Epistle to the Hebrews, has been widely regarded as from Paul's pen, but the marked variance in form, style, manner of reasoning and type of thought from the epistles generally recognized as his, has caused this epistle, which neither claims Paul as author nor was attributed to him by the earlier Fathers, to be at the present time all but unanimously regarded as non-Pauline.

Of the four first named of these 13 epistles, Paul's authorship has never been doubted by any sober criticism. The attempt of van Manen and a few other critics to revive the view of Bruno Bauer, that no writings at all of the Apostle have been preserved, have had no influence on the general opinion of scholars. The claim that there are decided inconsistencies in these letters is dismissed with practical unanimity as "hypercriticism," and it is recognized that in no period of the history of the Church before 125, soon after which the epistles appear to have been widely accepted, would the four chief epistles fit as they fit into the circumstances of the apostolic age, so far as they can be known, as, for instance, the Judaistic controversy among the Galatian churches. But, to leave out of account the later unanimous tradition of the Christian Church touching the Pauline epistles, before the close of the 1st century the letter of Clement of Rome to the church at Corinth decisively attested Paul's authorship of First Corinthians, and the likeness which runs through the four great epistles makes testimony to one to be indirectly testimony to all. It would, indeed, be incredible that any writer of the 2d century, especially a Christian chiefly intent on foisting on the Church at large under the name of Paul his own doctrinal views, could have conceived and depicted with such consistency and vividness such a nature as that of Paul,—fervid, profound, impetuous, self-mastered, tender, strong, a personality so rich in so many elements of character.

If the four chief letters are accepted as Pauline, because certified to by unanimous tradition, undisputed by sound criticism and suf-

ficiently self-evidencing, it will follow for similar convincing reasons that First Thessalonians, Philippians and Philemon should also be accepted, as, indeed, they are to-day by the great majority of unbiased critics. On careful consideration Second Thessalonians will commend itself as Pauline alongside the First Epistle, which in style it strongly resembles, but not so closely as to necessitate the hypothesis of copying, while the difference between the two epistles in the presentation of the eschatological teaching would be unnatural, if another were writing under the name of Paul. In spite of an unlikeness in style to the epistles already discussed, the Pauline authorship of Colossians has found steadily increasing favor among critics, so that it is now quite generally accepted, especially in view of the facts that the historical notices seem too natural to have been fabricated, and that the errors against which it was directed prevailed in that form only early. If Colossians can be accepted as Paul's own, no reason remains for doubting his authorship of Ephesians, for the unlikeness in style to his earlier writings is no greater than was the case with its sister epistle, and the great likeness of Ephesians to Colossians, which has been used in argument against the genuineness of the former, is no more than might easily have resulted when two letters were written practically simultaneously. As touching 10 of the epistles then the tradition of the Church has after long and keen debate been verified by the verdict of critical scholars, in most cases with practical unanimity, in the remaining cases by a decisive majority.

With the "Pastoral Epistles," so-called, First and Second Timothy and Titus, the case stands otherwise and is still open. The traditional and patristic attestation is as strong for these epistles as for the rest, for the rejection of them by the heretic Marcion should be explained as due to his hostility toward their teachings. The argument against accepting them is threefold: first, that no place can be found for them in the life of Paul so far as it is known to us from Acts; second, that the style both in use of words and in general tone is decidedly unPauline, and, third, that they presuppose conditions ecclesiastical and doctrinal which could not have existed in the Church till the 2d century. In answer to the first it should be said that, if Paul was released from his first imprisonment, there was opportunity for the composition of these letters and for all that carries with it, and that history and tradition are quite as consistent with release as with a fatal issue of his case. As to the second class of arguments it must be recognized that we do meet language and a literary tone in some degree new, although but a brief interval between their appearance and that of preceding letters could have elapsed, but this might be due to any of several things, the use of a literary assistant, for example, who somewhat modified the Apostle's own style, and the existence of such circumstances can no more be positively denied than asserted. As to the third, it ought to be noted that there exist no standards by which to measure the rapidity of development in the life and organization of the primitive churches; and further, that the ecclesiastical constitution of the churches, the heretical views which seem later to have merged into Gnosticism and the hostile relation of the

Roman government, all seem less developed than we should expect to find them even as early as the year 100, much later than which those who doubt the Pauline authorship usually date their composition. Perhaps no positive answer can now be given to the problem as to the genuineness of the Pastoral Epistles, although there is a growing agreement that the historical notices which they contain are largely genuine, a fact which additionally complicates the problem. While the attempts to remove all the difficulties which surround these letters have not yet been fully successful, it seems on the other hand impossible to disprove their Pauline authorship.

In the following survey of the several epistles and their various occasions and characters, no attempt has been made to date them absolutely, but only relatively by placing them in connection with other parts of Paul's work as a missionary. (For an approximation to the absolute dating see article NEW TESTAMENT CHRONOLOGY).

What has usually been regarded as the earliest of Paul's extant writings is the First Epistle to the Thessalonians, but naturally it does not follow that he had never written such letters before, any more than that all which he wrote afterward have been preserved. On his second great missionary tour, after a short work at Philippi, his first work in Europe, Paul next preached at Thessalonica, now Saloniki, then the capital of one of the four divisions of Macedonia, and a busy and important city. Here for three weeks he preached in the synagogue, and then elsewhere to the Gentiles for we know not how long, possibly for months. But after a time the hostility of the Jews succeeded in driving Paul and his companions out of the city, and passing through Berea he went on to Athens, from which place Timothy was sent back to Thessalonica, not to rejoin the Apostle until after he was established at Corinth. His news was such that Paul at once wrote to the church touching three points: after expressions of gladness at their faith steadfast amid persecution, he assured them, in reference to calumnious accusations of which the rumor had been brought to him, that he really was still profoundly interested in them, and had repeatedly endeavored to revisit them; he warned them against heathen vices, and also against idleness and pauperism, and, finally, he instructed them about the resurrection of the believing dead at the return of Jesus which they were to expect. A second letter to the same church soon followed the first, by which in some sense it was occasioned. It seems that the stress laid upon the expected return of Jesus had led some to regard it as imminent, and to correct this misunderstanding of his views Paul wrote again in much the tone and even the language of the first, but adding the corrective teaching that much must happen before Christ comes.

Because of the very uncertainties which attach to it the Epistle to the Galatians may best be discussed next. The destination, the place of writing and the date of this epistle are all uncertain and strongly disputed. Those to whom it was addressed were formerly looked for with practical unanimity in the northern part of the Province of Galatia, but of late many scholars have located the Galatian churches in the southern part of the province, in the cities of Pisidian Antioch, Iconium, Derbe, Lystra and their

neighbors. Certainly on this theory the Epistle gains greatly in vividness. The date and place of writing go together, and hang somewhat on the answer to the question of destination. If the Galatians of the letter are to be found in northern Galatia, then it is all uncertain when and where the letter was written, after the Thessalonian Epistles or before the Cæsarean imprisonment. On the South Galatian theory, it might even have preceded First and Second Thessalonians though probably not, and must have been written before Paul left Antioch for the last time, on his third tour. But whatever the uncertainties which thus surround the letter, when we take it up to read all is distinct. The Galatian churches had been approached by teachers who insisted that Christianity was incomplete and salvation impossible if keeping the law of Moses was not added to that simple faith in the crucified Christ which had been the converting message of Paul. To meet this condition he wrote with the utmost ardor and force, urging first that the message which he had presented must be adhered to because it had come to him by revelation and hence was finally authoritative, and then, not to rest in authority alone, that this view was the only one which was consistent with the facts of Judaism itself and with Christian experience; finally he sets forth the power of Christianity to secure a good life, the indwelling Spirit of God. While in his surprise and distress at the threatened apostasy of his converts Paul is much less considerate of form and phrases of address than is his wont, partly as a result the epistle is one of unsurpassed intensity, vividness and force.

After a stay of 18 months in Corinth where the Thessalonian letters were written, Paul left the church which he had founded there, and, having visited Jerusalem and Antioch, established himself at Ephesus for a three years' ministry in that city. During the latter part of this time disquieting rumors reached him in various ways as to the condition of the Corinthian Church. It was rent into factions; it was tolerating gross immorality; the meetings for worship were disorderly, and even the Lord's Supper was a scene of confusion; more than one question had come to be of such practical importance that the church consulted the Apostle about it by letter, and, finally, reiterated instruction on the topic of the resurrection had become indispensable. Out of this situation grew the First Epistle to the Corinthians with its wealth of practical directions, warnings, instructions and exhortations beyond all Paul's other writings.

To the first letter to the Corinthians he was later obliged to add a second. While much of the purpose of First Corinthians seems to have been gained by it, at the same time disaffection against Paul and keen hostility to him appear to have even increased in some quarters so greatly that until this sentiment could be changed it seemed best not to revisit Corinth himself. He had sent both Timothy and Titus on special missions, and in his anxiety himself removed from Ephesus to Macedonia in order to know soonest and surest the condition of the church and their attitude toward himself, his anxiety being rendered keener from the nature of a letter which he had sent, which it had cost him pain to write and which might have been too severe in tone for his purpose, a letter which

can scarcely have been our First Corinthians, and must be lost, unless the acute but unverifiable suggestion of several critics is correct, and Second Corinthians (x-xiii) constitutes the kernel of the supposedly lost letter. In the state of mind natural to any ardent and affectionate nature in the face of intense and unscrupulous hostility Paul wrote the most personal of all his letters, a letter largely autobiographic in character, by turns tender and severe, pleading and sarcastic, though these qualities are most strikingly present in the second part of the letter, which, as has just been said, some would separate from the rest. In marked contrast to the First Corinthian Epistle, the great value of which lies in its practical instructions, the interest of the Second lies mainly in the revelations which Paul makes as to his history and sentiments and relations to friend and foe. The effect of the Epistle must have been salutary if not, indeed, completely satisfactory, for the letter to the Romans proves that he was soon after present in Corinth.

The Epistle to the Romans, the longest and apparently the most carefully prepared of all his epistles, was addressed to a church which he had not planted and which he had never visited. Naturally it must be more general in character than the rest, for there was nothing in the occasion of it which would limit its purport and scope. Having now completed the work which had pressed upon him in the Eastern world, having established Christianity in the great centres of Syrian Antioch, Pisidian Antioch, Ephesus and Corinth, beside many less important places like Philippi and Thessalonica, the Apostle's eye now turned westward and his thought fixed itself next on Rome, the capital of the world, whither everything in the empire tended, whence influence radiated to every part of the empire. While of course the fact that Christian work was effective at Rome would not ensure that it would reach the upper classes elsewhere, yet the fact would immensely increase its influence in the classes that might be touched. We have no historical basis as to when or how Christianity was planted at Rome; we only know that it was in existence and that in the constant ebb and flow of migration the faith of its members was widely and favorably known. While to many there Paul with his wide acquaintance would naturally be personally known, a supposition with which the number of his greetings at the end of the Epistle is in perfect harmony, yet to more he must have been still unknown, and doubtless not a few would be by the persistent misrepresentations of his enemies have been brought into a temper of hesitancy and suspicion about him. Because he hoped soon to visit Rome, and because at the same time his projected journey to Jerusalem would certainly delay the visit, how much he could not and did not foresee, he wrote a letter which might prepare the way for his later ministry with the church at Rome. With a dignity and thoroughness worthy of the occasion, Paul proceeded to write his answer to the three great questions then dominating theological controversy: How can a man secure God's forgiveness and favor? What will be the life of a forgiven believer? How does this gospel of a grace that comes indiscriminately to Jew and Gentile on the sole condition of faith fit with the ancient promises to Israel, and how explain the failure of the

Jews to accept this gospel of Christ? Accompanying his answer to these questions with statements which involve his conclusions on almost every doctrinal point, the letter continues beyond the theological discussion to furnish a rapid summary of the duties of the Christian life with more stress than he elsewhere laid on the duties of the citizen toward those in public authority.

As perhaps the next letter after those to the Corinthians was written at Corinth, so after the letter to the Romans the next letters were written from Rome. There are four letters which were penned while Paul was living a prisoner in his own hired house in Rome, and three of the four, those to the Ephesians, to the Colossians and to Philemon constitute the most closely related group among the Pauline epistles. The only clue as to whether Philippians preceded the others of this group in time or followed them is found in Paul's expressions of feeling as to whether he might expect release as the result of his appeal to Caesar. These statements are, however, too uncertain to justify positive conclusions as to the order of the four epistles. In character the Epistle to the Philippians is the least doctrinal in substance and the most affectionate in tone of all Paul's letters. Such doctrinal teaching as is found in this epistle is enwrapped in the incidental declarations of the Apostle or in his abrupt and stern denunciations of certain unnamed errorists against whom he warns the Philippians. Their false doctrine seems to have been at least remotely akin to that of the Judaizers whom he had combated in the Epistles to the Galatians and the Romans, possibly still more closely to that of the nameless faction condemned in Second Corinthians. The occasion of this letter was gratitude for the once more repeated gifts of the Philippian Christians toward his support, and its tone throughout is that of joy. Even when he speaks of his own privations, his expressions are in harmony with his injunction, "Rejoice in the Lord alway; again I will say, rejoice."

The Epistle to the Colossians is apparently, like that to the Romans, addressed to a church which Paul did not found and had never visited, though its existence was probably due to the radiating influence of his long work at Ephesus, the metropolis of western Asia Minor. Epaphras, presumably the founder of the Colossian church, had visited Paul in his Roman imprisonment, and we may well suppose that it was from him that Paul had learned the effect on Christian faith and life which the teaching of certain errorists was having. It is hard from the statements of the Epistle to deduce with certainty the exact nature of the views combated, but the errors seems to have been both speculative and practical. While on the one hand they involved an asceticism in closest harmony with the practices of the Jewish Essenes, on the speculative side they anticipated to some extent the developments of later Gnosticism. To meet this false philosophy a true conception of the place of Christ and of his relation to the universe was needed; so the dominant note of the Epistle is the sole and supreme greatness of Christ, who by His unity alike with God and men obviates the necessity of angelic mediators and even precludes the possibility of their activity. This conception consistently carried out

cuts the ground from under false asceticism and every form of mere legalism, and no less requires and ensures the highest type of personal and social morality.

The sister epistle, to the Ephesians, includes a surprising number of the same thoughts and words, but they are used with a complete lack of all apparent imitation to bring out a wholly different general idea. While here, too, Christ is exalted, the main thought is the oneness of all Christians, that the work of Christ results in the removal of all barriers that separate men, notably of the hedge of the Mosaic law which had divided Jews and Gentiles. It has been plausibly held by many that the destination of this letter was a wider circle of readers than the single church at Ephesus, it being a circular letter to all the churches in the region, of which circle the churches at Ephesus and Laodicea would be positively known to us. On the one hand we know from Colossians that a letter was simultaneously dispatched to the Laodiceans; on the other, doubt is cast on the present address, "in Ephesus," by a little but weighty evidence for its omission. Further that no personal salutations are added is somewhat surprising when we remember how long Paul had worked at Ephesus, but natural if the letter was equally intended for other churches, and the conception of Christian unity which dominates the Epistle is admirably fitted to be the theme of a circular letter. This hypothesis, while not to be regarded as already proved, if, indeed, ever provable, seems well to suit the conditions of the case, and in some respects the Epistle gains in significance when thus regarded.

Another epistle, certainly dispatched with that to the Colossians, is the letter to Philemon, who was, as we infer, a well-to-do Christian residing at Colossæ. One of his slaves, Onesimus by name, had run away, stealing as he left, and in far away Rome had come under the influence of the same Paul under whose influence his master, Philemon, had earlier been converted. Paul had found the fugitive slave, now a changed man, to be very useful for service to himself, but unselfishly sent him home with a letter intended and admirably adapted to secure pardon and favor from his master, who is even bidden to treat him as a loved brother. This brief letter is not only a delightful bit of self-revelation on the part of Paul, but was arranged with consummate tact to secure its purpose.

The three epistles, two to Timothy and one to Titus, usually called from the subjects which they chiefly treat the Pastoral Epistles, agree very closely in style, in matter, in the ecclesiastical conditions pictured, and, finally, in the fact that their composition must, in the practically unanimous judgment of scholars, stand outside the life of Paul as presented in Acts. If not genuine, their occasion and purpose and the time and place of their composition must remain a matter of unsupported conjecture. If they are authentic works of the Apostle, Paul must have been released from his first imprisonment at Rome, and have traveled widely in the further course of his missionary work, although no record of it is preserved outside these letters. During this period of his life he must have made the visit to Spain, which he purposed when he wrote to the Romans, and of which some tradition remained in the churches;

he made a tour in Crete; he again visited Miletus, if not Ephesus as well; he found his way to Troas and Corinth and we know not how many other such cities, and he expected to spend a winter in Nicopolis. Probably before he reached Nicopolis he was arrested, taken again to Rome, had a preliminary hearing of his case, and with the expectation of a dreary winter in a chill dungeon he wrote to his beloved Timothy to come if possible before winter and to bring with him a cloak and some parchments which had been left at Troas. From uncertain points on this route from Rome to Rome again letters had been dispatched to Timothy at Ephesus and Titus in Crete, perhaps the former from Macedonia, the latter from Corinth. These letters agree closely: in each Paul gives to the man addressed a certificate of appointment and authority, really intended to influence the churches over whom each was set and quite likely useful, not to say necessary, for that purpose; gives directions as to church life and administration; gives serious warnings against a type of error which is not clearly defined, but seems a jumble of pagan philosophy and Jewish fable, not unlike the Colossian heresy. While in these letters there is more of restraint than was common to the Apostle, a fact which their semi-official character may explain, in the second letter to Timothy, in point of date the last attributed to him, he poured out his very heart in expressions of personal sentiment and Christian experience and assurance, so tender, so strong, so fitting that from many critics who reject the most part of the Pastoral Epistles as interpolation or forgery of a much later date, these words at least have forced a recognition of themselves as of necessity genuinely Pauline.

Taken as a whole, no more remarkable series of letters has ever been penned than the Pauline Epistles. They have too often been regarded merely from the dogmatic and critical standpoint. Whatever the significance of the critical discussions for which they furnish large material, however rightly they have been considered important and profound, even inspired and authoritative statements of theological and ethical truths, beyond these they are personal communications of a great soul to those whom he trusted, sometimes his beloved friends, and as such also they should be regarded. In them the practical leader, the profound thinker, the religious enthusiast, the friend sympathetic with others and himself hungry for sympathy, uncaps his very soul, and lets us see all his thoughts in their making, hear the sob of his often lonely and disappointed spirit, count his heart-throbs, as it were; and none ever better stood the test of such intimacy. Beside their worth to criticism and theology these letters greatly serve psychology and the study of Christian experience; beside being historical sources and canonical Scriptures, they are also personal documents, invaluable to literature and life.

Hamilton Theological Seminary, Colgate University.*

PAULINUS, Pontius Meropius Anicius, Saint, ecclesiastical writer: b. Bordeaux, 353; d. Nola, 431. He was consul at Rome and later prefect of the province of Campania. He married a very wealthy Spanish lady, Therosia, and became a man of very considerable note. Through the efforts of Ambrose he was induced to accept the Christian faith; upon which he distributed his wealth among the poor; and though he remained in Spain he gave up his political offices and finally he was ordained a priest in 393 at Barcelona, after which he went to Rome. In 394 he retired from the world and lived as an ascetic at Nola, of which he was elected bishop in 409, a position he retained until his death. He was present at the Council of Ravenna (419); and his name frequently occurs in the letters of Augustine and Jerome. He is best known as Paulinus of Nola. His festival is celebrated on 22 June. Many hymns and letters were left by him and have been collected by Muratori and Migne. Consult Buse, 'Paulin, Bischof von Nola, und seine Zeit' (1856); Lagrange, 'Saint Paulin de Nole' (Paris 1882); Reinelt, 'Studien über die Briefe des heiligen Paulin von Nola' (Breslau 1904).

PAULINUS OF YORK, Saint, an ecclesiastic of the 7th century, first archbishop of York: d. 10 Oct. 644. He was sent by Pope Gregory I in 601 to England where he labored under Augustine in the evangelization of Kent. By him he was consecrated bishop in 625, when he accompanied Ethelburga on her marriage to the heathen Edwin, king of Northumbria. For a long time he made no progress in his mission beyond baptizing the infant princess; but at length Edwin and his court submitted to baptism at York, in a wooden chapel dedicated to Saint Peter, the foundation of the minster, Easter Sunday, 627. Paulinus now carried the Gospel over Northumbria, but after six years' constant labor the death of Edwin in battle at Hatfield put a sudden end to his work, and he was obliged to flee before the Northumbrians. He went back with the widowed queen to Kent. In the same year he received the "pallium" as archbishop of York from Rome, but he never returned. In the meantime he was made bishop of Rochester; and there he died and was buried in the chapter-house. Consult Bright, W., 'Early English Church History' (Oxford 1888); Plummer, A., 'The Churches in Britain before A.D. 1000' (Vol. I, London 1911); Williams, H., 'Christianity in Early Britain' (Oxford 1912); 'Cambridge Mediaeval History' (Vol. II, New York 1912).

PAULISTS, or PAULIST FATHERS, the name familiarly given to the "Congregation of the Missionary Priests of Saint Paul the

Apostle." This body of priests, the sole religious congregation of clerics which is of American origin, was founded in 1858. A short time prior to this date, five American converts to Catholicism had joined the Redemptorist Order, and were actively engaged in preaching missions throughout the United States. These men were Isaac Hecker (q.v.), sprung of German Lutheran stock, and, a short time before his submission to the Catholic Church, a member of the Brook Farm community of "Transcendentalists"; Clarence Walworth and Francis Baker, both former Episcopalian ministers; George Deshon, a classmate of General Grant at West Point, and Augustine Hewitt, who, reared in New England Congregationalism, had afterward joined the Episcopalian Church. The experience of these men in their priestly work, and their intimate knowledge of American conditions, convinced them that the Redemptorist Order, to which they belonged, would not adequately meet its opportunities in this country, unless it attracted a greater number of American subjects, and became more at home in the language and national characteristics of the people. At that time nearly all the Redemptorists working in the United States were Germans. The five converts earnestly advocated the establishment of a house to serve as the headquarters of the English-speaking members, which, with English as the language in common use, might help to attract a larger number of American recruits, so much needed in the missionary field. Both Archbishop Hughes of New York and Bishop Bayley of Newark heartily supported this project. The German members of the order looked upon it with disfavor. According to the constitutions of the order, any member, if in conscience he deemed it necessary, enjoyed the right of personally laying any important question before the superior-general in Rome, without the permission of the local superiors. In 1855 a general chapter of the order had voted to abrogate this article of the constitutions. This decision, however, had not yet been approved by the Pope, and consequently was not yet definitively settled. The rector major, or superior-general, had, however, ventured to anticipate the action of the Holy See, so far as to issue a circular letter prohibiting, under pain of expulsion, any American Redemptorist from leaving America without express permission. The five American Fathers taking their stand upon their constitutional right, delegated Father Hecker to go to Rome to lay before the authorities the project of establishing an English-speaking house. Furnished with highly creditable testimonials as to his exemplary life from his provincial superior, Father Hecker sailed from New York, and arrived in Rome on 26 Aug. 1857. He was met by his superior with a decree of expulsion from the Redemptorist Order. Upheld by his confrères in America, whom he represented, Father Hecker appealed to the Propaganda; and after some delay, he was at length vindicated by Pius IX, who gave to him and the other American Redemptorists advice and encouragement to found a new missionary community.

With an enthusiasm which has ever since characterized their congregation, the five priests entered upon their new vocation under the pat-

ronage of Saint Paul. Their twofold purpose — a purpose incorporated in their constitutions, and held before every Paulist as his ideal — was personal perfection and zeal for souls outside the Catholic faith. Lovers of America, and deeply penetrated with the national spirit, it was natural that they should lay special stress upon the cultivation of personal initiative, spiritual liberty, a high sense of honor and duty and the virtues of fortitude and fidelity. Hence, it is a characteristic of the Paulists, the followers of Father Hecker, to aim at the highest possible legitimate development of the individual, interfering with him only to the extent dictated by the common good and the requirements of conventual discipline. It is in keeping with this spiritual scheme that, while the Paulists do not take the usual vows of religious orders, they live the life of the vows in strictness. This interior spirit of the congregation has been widely misunderstood; it must be appreciated correctly, if one is to form a just judgment of the institute and of its founder. The absence of vows is not an indication that the Paulists wish to exempt themselves from any burden of the religious life; for, even had they solemn vows they would be no more devoted to the evangelical counsels than they are at present. But, without vows, to live as though solemnly vowed, implies a spirit of individual conviction of enthusiasm and of free consecration which best harmonizes with the interior and exterior vocation to which the Paulists devote themselves.

In carrying out their chosen work, the Paulists, though few in number, have left a clearly defined impress upon the course of the Catholic Church in America. It is chiefly due to them that a systematic and persistent endeavor to bring non-Catholics into the Church is now extensively organized among the diocesan clergy. Their example is stimulating other religious societies to fraternal emulation. In missionary work of this kind the Paulists are uncompromising in presenting the doctrines and claims of Catholicity, while, at the same time, they carefully avoid the polemical attitude which only arouses and exasperates religious prejudice. Another work in which they stand in the foremost rank is the promotion of temperance. Exhortation to total abstinence is a characteristic of their mission preaching; and their printing-house in New York is the headquarters of the publication bureau of the Catholic Total Abstinence Society. The propaganda of the press was an early ambition of the Paulists. In 1865 they founded *The Catholic World*, a monthly magazine; in 1870 they established for young readers a bi-weekly, *The Young Catholic*, which is now a monthly under the name of *The Leader*; in 1896 they began to issue a quarterly, entitled, *The Missionary*, which serves as the organ of the non-Catholic missions. Besides these periodicals, their presses turn out, annually, hundreds of thousands of pages of devotional, homiletic and apologetic literature. Another feature of Paulist endeavor has been the observance, in public worship, of strict ceremonial, including only Gregorian music, highly developed in their imposing basilica at 59th street and 9th avenue, New York City. Recent figures give the number of Paulist Fathers as 64. They have missionary houses in New York, San Francisco, Winchester, Tenn., Chi-

cago, Austin, Tex., and Portland, Ore.; and a house of studies at the Catholic University, in Washington, D. C. Consult Hewitt, N. A., 'Memoir of the Life of Francis A. Baker' (7th ed., New York 1889); Elliott, W., 'Life of Father Hecker' (New York 1899).

JAMES J. Fox, S.T.D.

PAULITES, or HERMITS OF SAINT PAUL, an obscure religious order of men who take Saint Paul, the first hermit, as their patron. The order was established in 1250 by uniting the Hermits of Saint Augustine with those who lived under the rule of Saint Eusebius of Grau, who became the first superior of the new organization. They now follow the rule of Saint Augustine. They are found in Italy, France, Spain, Germany and other countries. They usually wear a short cloak and cowl and go barefooted. They also wear a beard. There were various orders of Paulites. The earliest of these is believed to have had its origin in Hungary on the date above indicated. The order spread with considerable rapidity throughout northern Europe; and it attained to a strong position of influence in Hungary where it counted 170 cloisters. But owing to the fact that the order was involved in political intrigue most of its houses were suppressed in the 18th century; but a few still exist to-day in Poland. About 1420 the Paulites entered Portugal; but were suppressed about 150 years later. In France, the Paulites, popularly known as the 'Brothers of Death' had a short life (1620-33). The 'Blind Sisters of Saint Paul' is an order founded in Paris in 1852, to assist blind women and children; and the Sisters of Saint Paul of Chartres (Hospitallers of Chartres) appeared in the latter part of the 18th century with the avowed object of taking care of the sick and poor. Consult Currier, 'Religious Orders.'

PAULO AFFONSO, pow'lo äf-fön'so, Falls of. See SAO FRANCISCO.

PAULOWNIA, a genus of ornamental trees of the family *Scrophulariaceæ*. The species, of which three have been described, are natives of Japan and China. The best-known species (*P. tomentosa*) is catalpa-like in habit of growth, having stout, spreading branches and flowers in terminal panicles. The flowers, however, are bell-shaped and the fruits two-celled capsules instead of long pods. In favorable climates the trees become 40 feet in height; in cold localities they are often killed to the ground by frost, but send up numerous sprouts from the stump. At Montreal they are often planted for screens or specimens on lawns, their rapid growth, often amounting to more than 12 feet in a season, and their striking foliage (leaves frequently a foot wide and two feet long), making them very interesting. At New York City the tree is hardy but its blossom buds are frequently killed by the winter. In this species the flowers resemble those of foxglove, are violet in color and fragrant. They appear in great profusion in April or May. An evergreen species has recently been discovered in southern China, and is said to be one of the grandest of floral spectacles when in blossom.

PAULS VALLEY, Okla., city and county-seat of Garvin County, situated on the Washita

River, the Gulf, Colorado and Santa Fé and the Atchison, Topeka and Santa Fé railroads, 55 miles south of the city of Oklahoma. A State training school for boys is located here and there are cotton compresses and a bit and spur manufactory. The municipality owns the waterworks. Pop. 3,694.

PAULSEN, powl'sēn, Friedrich, German philosopher: b. Langenhorn, Schleswig, 16 July 1846; d. 14 Aug. 1908. He was educated at Erlangen, Bonn and Berlin, became a lecturer at the University of Berlin in 1875, and professor of philosophy and pedagogics there in 1873. Paulsen was a Kantian, and found in that philosophy the basis for the philosophic thought of the future. He held that Kant showed knowledge to be limited to the facts derived from the observation of the relations of phenomena in time and space. The power of value (or the good) is not demonstrable by science, but must be entrusted to faith. But science proves that there exists no scientific impossibility in belief in the indestructibility of that which possesses worth, of the freedom demanded by the will and of a world beyond the reach of sense. Faith is in no danger of a real attack from science, but science may remove obstacles from the way of faith. The empirical view of the world remains incomplete and valid for only restricted human observation. Among Paulsen's more important works are 'Entwicklungsgeschichte der Kantischen Erkenntnisstheorie' (1875); 'Gründung, Organization und Lebensordnung der deutschen Universitäten im Mittelalter' (1881); 'Geschichte des gelehrten Unterrichts auf den deutschen Schulen und Universitäten' (1885); 'Realgymnasium und humanistische Bildung' (1889); 'Ethik' (1889); 'Einleitung in die Philosophie' (1892; Eng. trans. 1895), a work of high literary as well as philosophic value; 'Immanuel Kant' (1898); 'Kant, der Philosoph des Protestantismus' (1899); 'Schopenhauer, Hamlet and Mephistopheles' (1900); and 'Philosophia Militans' (1900; 2d ed., 1901), containing a vigorous reply to the 'Welträtsel of Ernst Haeckel'; 'Das deutsche Bildungswesen in seine geschichtlichen Entwicklung' (1906); the same translated into English (1908); 'Richtlinien der Jüngsten Bewegung im höheren Schulwesen Deutschlands' (1909).

PAULUS, pow'loos, Heinrich Eberhardt Gottlob, German theologian: b. Leonburg, near Stuttgart, Württemberg, 1 Sept. 1761; d. Heidelberg, Germany, 10 Aug. 1851. He studied in Tübingen, Göttingen, London and Paris, making a specialty of Oriental languages and theology; in 1789 he was called to the chair of Oriental languages at Jena and in 1793 took the chair of theology in that institution which he filled until 1803 when he accepted the same professorship at Würzburg. In 1808 he became director of the department of public worship at Bamberg, at Nuremberg in 1809 and in 1811 at Ansbach. In that year he accepted the professorship of church history at Heidelberg. Paulus was an earnest exponent of rationalistic theology. Among his best-known books are 'Life of Jesus as the Foundation of an Original Work on Christianity' (1828); 'An Exegetical Handbook of the Three First Evangelists' (1830).

PAULUS, pā'lūs, Julius, Roman jurist of the latter part of the 2d and the first part of

the 3d centuries A.D. He was a legal assessor under the emperor Septimius Severus, was exiled by Elegabalus, was recalled and became praetorian prefect under Alexander Severus. He wrote much. His commentaries on the civil law covered 16 books; and those on the praetorian (equity) law 78 books. In addition to this vast amount of legal work, he published 48 books of 'Questions' and 'Answers' and many articles on a variety of other subjects. His 'Sententiae' (in five books) presents, in a readable and succinct form, the entire civil and praetorian law. His 'Institutes' for beginners was long a favorite among students of Roman law. More than one-sixth of the Digest of Justinian is taken from Paulus. Consult Huschke, 'Jusprudentiae antejustinianae quae supersunt' (Leipzig 1879).

PAULUS AEGINETA, ēj-i-nē'tā, or **PAUL OF AEGINA**, Greek medical writer, probably belonging to the latter part of the 7th century A.D. His encyclopedic work, 'Artis Medicae Principes,' translated into English in three volumes (1844-47), shows great erudition and good judgment, and is noteworthy for its information on early surgery. Paul was in high repute with the Arabians, who called him Al-Kawābeli, the Gynaecologist, and translated his 'Principes' into Arabian.

PAULUS DIACONUS, dī-āk'ō-nūs, 'Paul the Deacon,' also called **WARNIFRIDUS**, and **PAULUS MONACHUS**, 'Paul the Monk,' the earliest of mediæval historians: b. Friuli, about 720; d. about 800. He was educated in the court of the Lombard kings at Pavia. On the capture of Desiderius, the last king of the Lombards, by Charlemagne, he retired to the monastery of Monte Casino, where he took the cowl. In 781 he was called to the court of Charlemagne. Paulus drew up a book of homilies from the Fathers, which was in general use throughout Europe during the Middle Ages. He also wrote a history of the bishops of Metz, 'Gesta Episcoporum Metensium,' which is to be found in the second volume of Pertz's 'Monumenta Germaniae Historica.' In 787 he returned to his monastery at Monte Casino and spent the rest of his life in religious and literary labors. Here he wrote his history of the Lombards, 'De Gestis Langobardorum Libri VI,' his principal work. It is written in a lucid and elegant style, is prized for its general truthfulness and contains a mass of information elsewhere unobtainable. It commences with the migration of the Lombards from Scandinavia to the death of King Liutprand. The best edition is contained in Muratori's 'Rerum Italicarum Scriptores.' It is interesting and, in a sense, quite remarkable for the number of legends it contains, all of them poetical, and all relative to the early Germans. Paulus was also a writer of hymns and the author of numerous theological works, popular in their day. His history of the Lombards was translated into German by Reinhardt Jacobi and published in Leipzig in 1888 and an English translation was made by W. D. Foulke, who attached thereto good notes and biography (Philadelphia 1907).

PAULUS HOOK, formerly the name of the site of Jersey City, N. J., where fortifications were constructed by the Americans in 1776. The works were captured by the British

in September of the same year, but on 19 Aug. 1779 a party of American soldiers, under Lieut.-Col. Henry Lee (q.v.), retook and partially destroyed them. The British garrison was surprised and 159 prisoners were taken, with an American loss of two killed, three wounded. Paulus Hook was again reduced by the British, who held it until the end of the Revolution. The feat of Lee and his men was commemorated 21 Nov. 1903 by the dedication of a monument on the Paulus Hook battleground. The memorial, erected under the auspices of the Daughters of the American Revolution, is a rough-hewn granite shaft standing in the middle of a public square in Jersey City, and within the lines of the old fortification. An interesting feature of the dedication was the oration delivered by Gen. Fitzhugh Lee of Virginia, a grandson of "Light Horse Harry."

PAUMOTA, pā-oo-mō'tā, or **PAUMOTU**, pā-oo-mō'too, native name for the Low Archipelago, a group of islands in the south Pacific. See **TUAMOTU ISLANDS**.

PAUNCEFOTE, Julian, LORD, English diplomat: b. Munich, Germany, 13 Sept. 1828; d. Washington, D. C., 24 May 1902. He was educated at Marlborough College and in Paris and Geneva. He began the practice of law in 1852, was, for a time, secretary to the colonial minister, Sir Samuel Molesworth, and in 1862 went to Hongkong where he practised law and became attorney-general in 1865. In 1872 he became chief justice of the Leeward Islands, in 1876 legal assistant under-secretary at the Foreign Office, and in 1882 permanent Under-Secretary of State for Foreign Affairs. In 1889 he was appointed Minister to the United States, and 1893, when the office of Ambassador was created, he was first to present his credentials as Ambassador. His marked diplomatic ability and evident friendliness toward this country did much to bring about cordial relations between England and the United States. In 1890 he accepted the principle of arbitration for the Bering Sea dispute and in 1892 signed the treaty. He managed the Venezuelan dispute skilfully, and negotiated a general arbitration treaty between Great Britain and the United States which was rejected by the Senate. He was most earnest in his efforts to abrogate the Clayton-Bulwer Treaty and negotiated and signed the treaty which supplanted it. (See **HAY-PAUNCEFOTE TREATY**). He was British delegate to The Hague Peace Conference in 1899 and was raised to the peerage as Baron Pauncefote of Preston in recognition of his services there.

PAUPERISM (from Lat. *pauper*, 'poor'). The word, strictly speaking, applies not to temporary destitution, not at all to "honest poverty," but to chronic willing dependency. It is applicable to those who are partly supported by charity, as well as those wholly thus supported, if the condition is chronic. Destitution arising from such misfortunes as sickness or the death of the family bread-winner, is usually a curable condition, and does not often sink into pauperism except through the maladministration of relief, as when more is paid to the beggar than he could possibly earn, so confirming him in his degrading habit, and tempting his neighbors to give up their hard work and strike for the easier task and higher wages of beggary. The history of pauperism is, for the most part,

a history of the successive mistakes in poor relief of over-zealous humanitarianism and unwise charity.

Early History.—Imperial Rome presents the first notable instance of pauperizing by undue aid. Ambitious politicians gave free grain, not to the wounded and helpless, as Athens had done, but to all men residing in the capital who could prove themselves Roman citizens. This began when votes could thus be bought under the republic. Julius Cæsar found one-third of a million of these able-bodied pensioners and cut the number down one-half; but Augustus allowed it to grow again. Marcus Aurelius, though a Stoic himself, gave these robust dependents bread and oil and meat. The strength of that world-conquering race was thus undermined and the demand of the beggared populace, "Bread and games," is recognized as the death cry of once invincible Rome. With Constantine, the succession of misdirected charity passed over to the Church. While the Christian churches had been small in days of persecution they had shown, in intensified degree, the spirit of neighborly helpfulness that had existed among the Jews, whose Mosaic code is the most charitable of any ancient law. In the early Christian churches there was not much to give, and relief was seldom excessive or bestowed without due knowledge of the case. But with the patronage of the emperor there came to the Church great charitable funds to be given in a general way to applicants whose circumstances in many cases would not be known. One-fourth of the Church funds in Rome were thus devoted to the poor. Charlemagne was the first Christian ruler to take a strong hold of poverty as a civil problem. He required bishops and nobles to provide for their poor. In 779 he forbade begging and imposed a poor-tax. He also provided institutions for widows and orphans, which were not sufficiently grounded, however, to abide after his death. But religious benefactions of all sorts multiplied, many of them established as atonements for the sins of the rich donors. In the 15th century cities began to take up the problem of relief, but not of prevention or cure.

Modern Pauperism.—After the civil and social commotions in the 16th century consequent upon the Reformation efforts were made to cheapen necessities, to secure employment, to help the poor to help themselves. Public work-houses appeared before the end of the 17th century and there grew up a literature on the subject of poverty. But in the opening years of the 19th century prolonged wars again increased poverty and beggary. Germany, before the World War, showed she had learned the lessons of the past by wise administration of private and public relief, with friendly visitors, thorough investigation and discriminating aid, and especially by compulsory old age insurance, said to have put 40,000,000 of her people beyond the fear of want in their last years. The general principles as to poor-relief in all the German states, except Bavaria, are laid down by the Imperial law of 6 June 1874, amended by the law of 12 March 1894. The territory under this law is divided into local unions (*Ortsarmenverbände*) and provincial unions (*Landarmenverbände*). Usually a local union is a commune (*Gemeinde*), while a provincial union consists of a large administrative division such as a circle (*Kreis*),

a province or a whole state. For the purposes of poor-relief a settlement is acquired by two years' continuous residence (after the age of 18), by marriage or by descent. A German in distress must be relieved by the local union in which he becomes destitute, and the cost must be refunded by the local union in which he has a settlement or by the appropriate provincial union. In communes poor-relief forms part of the ordinary local government business; in towns the actual administration is carried out by a special committee under the presidency of the burgher-master. Poor rates are usually not levied. In most large towns the Elberfeld system of unpaid district visitors is in force. Statistics of pauperism are not published regularly; the last issue related to the year 1885.

Under an Imperial law of 1883 and amending acts (codified in 1912), workmen must be insured against sickness and must themselves pay two-thirds of the contributions, their employers paying one-third. For accident insurance, under an Act of 1884 and amending acts, the contributions are paid entirely by the employers, and they, for mutual protection, have united into associations according to the nature of the industries in which they are engaged. The working of these insurance associations is controlled by government. For invalidity and old age insurances, under an Act of 1889, amended in 1899, the contributions are paid half by the workmen and half by their employers, while toward each pension the government grants an annual subsidy of 50 shillings. The employers are responsible both for their own and the workmen's contributions, but the latter may be deducted from wages paid subsequently. Contributions are paid by the purchase of stamps from the post office; these are affixed by the contributing person to cards on which there are spaces for stamps for 52 weeks. When the contributions are complete, the card is handed in to a specified office and a certificate given in return. The old age pension is given on the completion of the 65th year (from 1916 onward) of the workman's age, contributions having been paid for 1,200 weeks (equal to about 25½ years), a margin of five weeks being allowed each year. Austria cares for her poor by communes through the priests. Belgium has almshouses and compulsory labor for able-bodied dependents. Holland has been much praised for her labor colonies and numerous organizations to relieve and remove poverty. In France the Church, save in the period of the Revolution, has had chief charge of the poor, and its best relief agencies have been the Sisters of Charity and its numerous charitable institutions, many of them founded by Francis de Sales and Vincent de Paul and others of more recent origin to meet modern needs. Under modern conditions the poor are assisted partly through public "bureaux de bienfaisance" (welfare bureaux) and partly by private and ecclesiastical charity. They are partly under the care of the communes and partly of the departments, both of which contribute, and ultimately under the supervision of government. The funds of the "bureaux de bienfaisance" are partly derived from endowments, partly from communal contributions and partly from public and private charity. In 1912, 19,366 bureaux expended \$10,923,600 and assisted 1,260,000 persons ex-

cluding 92,000 persons in Paris. Public assistance is rendered to poor or destitute children. At the end of 1912 the institutions for this purpose contained 231,300 children; the expenditure during the year amounted to \$8,464,250. In 1912 the hospitals for the sick, infirm, aged or infants, numbered 1,892; they contained 231,517 beds, and at the end of the year had 68,700 patients, besides 75,540 aged and infirm inmates; their expenditures for 1912 amounted to \$40,881,200. In the same year 987,000 persons received gratuitous medical assistance at home and 185,000 in hospitals, the expenditures for such purposes amounting to \$5,800,000. At the end of 1912 the asylums for imbeciles, national, departmental and private, had 77,237 patients.

An act was passed in 1905 for the relief of the aged poor, the infirm and the permanently incurable, age limit, 70; but by the amendment of the Act, 5 April 1910, this was reduced to 65. The same amendment provided for limited help being given to those between the ages of 65 and 70. On 31 Dec. 1912, there were 310,000 such persons in receipt of the limited assistance, the total expenditure for 1912 having been \$1,837,800. The Act of 1910 provided that the cost of the scheme should be borne by the communes, the departments and the State. The number of persons registered for relief has risen from 511,446 on 31 Dec. 1908, to 599,061 on 31 Dec. 1911, and to 644,461 on 31 Dec. 1912. The cost to the State alone for 1910 was \$9,600,000; for 1911, \$9,920,000 and for 1912, \$11,100,000. In addition, contributions of the departments and communes totaled \$9,300,000 in 1911, and 10,158,600 in 1912; but it has to be remembered that the increased expenditure under this law is in part balanced by the diminished activities of the "bureaux de bienfaisance" in assisting invalids under 60 years of age. The Old-Age Pensions Law of 5 April 1910, as amended on 27 Feb. 1912, provides for all wage-earners old-age pensions toward which both employers and workers contribute. Contributions are to be paid up to the 60th year of the worker's life, and the State will contribute \$20. This sum will be increased by one-tenth for every insured worker who has brought up three children of the age of 16. On 31 Dec. 1913 8,011,138 persons were registered under the scheme.

It is instructive to recall England's mistakes in poor relief, which are representative of Scotland, Ireland and Wales also. In 1601 a great advance was made by the enactment of the poor law of Elizabeth. Begging had been forbidden in vain in previous centuries, but by that law all able-bodied paupers were required to work, under which requirement public workhouses developed. A serious backward step came in the Speenhamland law of 1795 by which a certain standard was set up as a "living wage" and all who fell short got an "allowance" from the public treasury. This of course encouraged employers to give low wages and made workmen content to receive them. In about 40 years the nation was startled to find its relief fund had quadrupled. Parliament investigated and found they had pauperized thousands by undue aid. In 1834 reforms were instituted by which "outdoor relief" was greatly limited and able-bodied persons were made ineligible for public

aid outside the poorhouses, which were made less attractive, only the plain necessities of life being provided. Nearly all except the aged and infirm were removed to special institutions provided for the deaf and dumb and other defectives and for children. A poor law, under a variety of statutes, is now applicable to the three Kingdoms, by which paupers, under certain conditions, are to be relieved in their own houses or lodged in workhouses or poorhouses built for the purpose. The law is administered by the Local Government Board, through boards of guardians elected for the purpose. England and Wales, including the metropolis and the municipal boroughs, are divided into 653 poor law unions, for each of which there is elected a board of guardians. In urban districts and in the metropolis guardians are separately elected, but in rural districts the rural district councillors act as guardians for the parishes they represent on the district council. Guardians are elected on the same popular franchise as district councillors. Women are eligible. In every civil parish overseers are appointed whose duty it is to make and collect the poor rate.

The amount expended in poor-relief for year ended 25 March for England and Ireland, and May 15 for Scotland (1913-14) was: England and Wales, \$75,279,315; Scotland, \$8,046,790; Ireland, \$6,379,565; total United Kingdom, \$89,703,670. For Scotland, the amount includes expenditure on buildings and loans repaid and interest.

Under the Old Age Pension Acts, 1908 and 1911, every person over 70 years of age who is a British subject; who for 12 out of the 20 years up to the date of receiving a pension has resided in the United Kingdom (residence abroad is allowed to count in certain circumstances); and whose yearly means do not exceed \$157.50, is entitled to a pension; provided he has not through idleness habitually failed to maintain himself and his dependents, is not in receipt of poor-relief (except medical and certain other kinds of relief), is not a lunatic in an asylum, has not been a convict in prison during the preceding 10 years for a term of upwards of six weeks, or during the preceding two years for a term not exceeding six weeks, and is not disqualified by order of a court.

Under the National Insurance Acts, 1911 to 1916, also, provision is made for compulsory insurance against loss of health, for the prevention and cure of sickness and for compulsory insurance against unemployment.

In America.—In the United States, from early times, every town in New England, every county elsewhere, has had its poorhouse, where at first all kinds of dependents and defectives and many delinquents were herded together. In recent years they have been sorted out leaving in the poorhouses, as stated above for England, few except aged and infirm adults. Some American cities have made the mistake of too generous outdoor relief, by which, at certain times, one-tenth of the population of such rich cities as Chicago and Brooklyn have been tempted to become wholly or partially dependent. Charity organization societies by their teaching and the co-operation they have secured among the administrators of relief have largely reduced this evil and other abuses of charity.

Statistics.—The census of 1910 reported an almshouse population in the United States num-

bering 84,198, of whom 57,049 were males and 27,149 females. Among this number were 2,486 children under 16 years of age. Of the whole number 42.6 per cent were foreign born and 57.4 per cent native born, including 7.5 per cent negroes. Of the foreign born the Irish were in largest proportion, with the Swiss next. Italy had the smallest proportional representation and Russia the next smallest. Regarding ages, 34.7 per cent were under 55 years; 34.2 per cent were between 55 and 69 years; and 31.1 per cent were 70 and older. Nearly one-third of the entire number had been in the almshouses less than one year and were there temporarily to tide over a period of special stress. About two-thirds of them were either physically or mentally deficient. The men were principally unskilled laborers, but there was a comparatively large percentage of farm and agricultural laborers, and a considerable number of skilled laborers—carpenters, painters, glaziers, varnishers, etc. The females were mostly of the domestic service class.

During the year 1910, 88,313 persons were admitted to the almshouses of the country; 17,486 died; and 59,110 were discharged. Of this last number about two-thirds had been inmates for less than a year. Three-fourths of those discharged returned again to the ranks of the self-supporting and the remainder were taken into the homes of relatives and friends.

The highest ratios to population of the almshouse paupers were in New Hampshire, Connecticut and California, in the order named. In New Mexico there were no almshouses and in Oklahoma very few. Louisiana, Wyoming and North Dakota were notable for their very low proportions. The number for the whole country averaged 91.5 per 100,000 of population. The ratio for New England was 181.4 per 100,000 and for the West South Central section (Arkansas, Louisiana, Oklahoma and Texas), it was but 18.6.

The statistics of charitable institutions aid in throwing light upon the extent of aid given regularly to the deserving poor. The average of such institutions in the United States in 1910 was 444 per 100,000 of the population and the average number of persons succored annually by each institution, 5,872. The total number receiving such aid in 1910 was 5,409,556 and the amount expended was \$111,498,155. In the Middle Atlantic section, the amount expended was an average of \$2.35 for each inhabitant; in the West South Central section it was 29 cents. No parallel can be drawn from such figures, for they exhibit only the aid given and not the need. It is to be said also that a very large sum of money is used in succoring the needy which does not pass through the treasuries of the benevolent societies and for which there is no accounting. The poorhouses in any case contain less than half of the chronic dependents, since there is among the poor a great dread of the "poorhouse," that inclines many who would in other days have gone there to become tramps instead and live by doles of food and clothes and money and by petty thieving, while there are also in every community many drunken and vicious persons who live altogether on the easy benevolence of others, besides a great number of widows and children supported regularly by relatives and by churches, not a few of these weakened by too much help until they willingly

receive and even expect and ask, if not demand, what they could by earnest effort get on without. A city officer of Cleveland, in 1903, estimated that one-tenth of that prosperous city in that prosperous year received charitable aid. Dependents have been classified as (1) absolute dependents; (2) temporary dependents; (3) paupers; (4) temporary dependents likely to become paupers. In the first class have been placed the aged, children, the crippled, the incurables, the feeble-minded, the blind, the deaf-mutes and the insane. In the second class the unemployed and widows with young children. In the third class professional beggars, tramps, degenerates. In the fourth class the sick and convalescents, the tuberculous, the inebriates and the drug habitués. Each of these classes requires different treatment and the foundation of all reform must lie in the restoration of self-respect in those who have abandoned it and the fostering of it in those likely to lose it.

Tramps.—The American poorhouse, with its few old and infirm inmates, and street begging in American cities, which is everywhere forbidden, but almost everywhere tolerated to some degree by public officers and private citizens, are the smallest part of the present American problem of pauperism, which is chiefly concerned with able-bodied "tramps," a term properly applied to those whose beggary is not localized but nationalized by constant travel from place to place. There are thousands who are tramps by choice, who tramp and beg rather than work even in the most prosperous times, especially in summer, when they can sleep out of doors without serious discomfort. Usually they ask for work, to evade the law against begging, knowing very well that most persons will give them food or clothes or money to get them out of the way in a hurry, lest they steal or do some act of violence or revenge. The tramps know also that town authorities will usually give them free lodging in station-houses for a few nights each and that even if they are arrested, rather than bear the expense of supporting them in jail for vagrancy, they will order them to "move on," sometimes even paying their fare to the next town. Stealing rides on freight trains is their common practice. They are gregarious and camp together in the outskirts of towns, going from these camps singly to their house-to-house begging. The chief cause of pauperism, other than careless alms-giving, are the vices that waste both the purse and the person. Sensuality weakens mind and body and destroys self-respect and thus leads straight to chronic dependency.

Cures.—The Charity Organization Society of New York reports that from 43 to 52 per cent of all applicants need work rather than succor. The approved cures of pauperism, in distinction from wise administration of temporary charity (see CHARITY), are: 1. A strong public sentiment against giving to unknown beggars. 2. Enforcement of laws against begging. 3. Philanthropic workyards where men out of work can be temporarily sent while hunting a new job. 4. Self-supporting loan bureaus, managed by philanthropists, where goods can be safely pawned at moderate interest. 5. Farm colonies, to which the city poor can be sent to work in company with others, avoiding the dreaded loneliness of ordinary farm life. 6. Friendly visitors and social settlements, by which the

strong can give themselves upliftingly to the weak, in recognition that "the lack of goods for the higher wants is not so bad as the lack of wants of the higher goods." 7. Tenement-house reform. 8. Old age pensions. (See OLD-AGE INSURANCE AND PENSIONS). 9. Public and private efforts to protect the children of the poor, by proper child labor laws and compulsory education laws, in their right to health, education and a favorable environment.

PAUSANIAS, Greek topographical writer of the 2d century A.D. His 'Hellasod Periegesis' in 10 books is an itinerary of his extensive travels. Pausanias visited all the most important places in Greece. He describes Attica, Megaris, Corinthia, Sicyonia, Laconia, Messenia, Elis and Olympia, Achæa, Arcadia, Boeotia, Phocis and Lacedæmon. His observation is accurate, and his descriptions simple and practical. His work has been edited by Siebolis (1822); L. Dindorf (1845); Spiro (1893). The edition by Clavier and other (1814-23) contains text, French translation and notes. J. G. Frazier's 'Pausanias' Description of Greece,' is the standard English translation (1898). Consult the valuable partial commentary in Harrison and Verrall, 'Mythology and Monuments of Ancient Athens' (1890).

PAUSILIPPO, pow-sê-lê'pô. See POSILIPO.

PAUWELLS, pow'êls, **Ferdinand**, Belgian historical painter: b. near Antwerp, 13 April 1830; d. 1914. He attended the academy at Antwerp (1842-50) and attained pre-eminent skill as a colorist under the instruction of Mapper, who represented the newest school of Belgian painters. His first picture of importance, 'Baldwin I and His Daughter Johanna' (1851), was followed by 'Coriolanus of Rome,' which latter obtained for him the "Prix de Rome." After an absence of four years in Italy he exhibited 'Deborah, the Prophetess'; 'Rispah, Saul's Concubine, by the Corpse of her Son' (1856). His reputation reached its height during his residence at Antwerp, where he painted 'The Widow of Jacob van Artevelde' (1857), which is in the Brussels Museum; 'Banished by Alva' (1861); 'The Call of Saint Clara' (1861); and other striking works. He became professor in the Art Academy at Weimar in 1862 and had a large following among the students. In 1876 he became professor in the Academy of Painting at Dresden. In the meantime he painted numerous historical pictures, among them 'Queen Philippina Ministering to the Poor in

Ghent'; 'Louis XIV Receiving the Deputation of the Genovese Republic'; and seven wall pictures illustrating the life of Luther. Among his later works are 'Count Philip of Alsace Visiting a Hospital in Ypres' (1877); 'Admonition' (Leipzig Museum 1879). Dramatic energy and power of facial expression, grandeur of style and brilliancy of coloring are the qualities of this artist who has had considerable influence upon modern painting. Yet he lacks power to express depth of feeling and strong characterization so noticeable in the greatest of the older masters.

PAVANE, an ancient Italian dance, popular during the 16th century. It was adopted in Spain, France, England and Scotland and was a favorite pastime in court circles. It was a solemn, stately dance, sometimes accompanied by a song.

PAVEMENT ANT, the small black ant (*Tetramorium cespitum*) which has long been naturalized from Europe, locating especially in the neighborhood of New York City, Philadelphia and Washington, D. C. It commonly makes its nests in galleries under the pavements of garden paths and village sidewalks. These galleries may be destroyed by kerosene oil or by boiling water. It occasionally has been noticed as storing grass seeds in granaries. In Europe it practises many interesting customs, entertaining idle ants of other weaker species, and sometimes deposing its own queens in favor of those of another race. See **ANT**. Consult Wheeler, W. M., 'Ants: Their Structure and Behavior' (New York 1910).

PAVEMENTS, the surfacing laid on a street or road to keep it in a condition capable of sustaining traffic. Pavements have been a leading feature of civilization in all historic ages, and their absence is evidence of a low degree of progress, if not of decay. The Roman Empire depended almost as much on its pavements as on its armies for keeping its vast dominion knit together, and Roman roads are to-day among the most valued legacies of Roman occupation in Great Britain and on the Continent. The more important Roman roads had a paved width of 16 feet, and while their grades were not what a modern engineer would approve, they answered satisfactorily the requirements of the era in which they were constructed. The Dark Ages witnessed, among other signs of decline, the virtual disappearance of pavements, so far as public use was concerned, and it was not until a king of France was sickened to the point of vomiting by the odor of mud stirred by a passing vehicle that pavements began to be laid in Paris. The spread of epidemics in the Middle Ages was doubtless helped along by the absence of pavements. The 18th century did not show much of an advance in this respect, and the records of New York prove that streets in the very heart of the city were in a condition that in these days would be most intolerable. Paving is costly and the cities and towns of the colonial period, and for many years after, were governed with rigid and often shortsighted economy. It was not until the 19th century that paving came to be regarded as otherwise than a luxury, to be indulged in only when the demands of traffic made it cheaper to pave the

streets than to flounder through mud-holes and climb over hillocks.

The necessity of street-paving is no longer a subject of discussion. It is regarded as much a requirement of settled communities as water and public lighting, and without it the enormous traffic of leading urban thoroughfares would be impossible. The only questions are as to which pavements are best, and the problem is one for the individual engineer on the individual job.

In the endeavor to secure a durable and therefore economical pavement for each particular locality, with due regard to future as well as present traffic, many kinds of resistant materials have been experimented with. Cast iron, at one time believed to be the ideal pavement, was soon discarded. The pavements now in favor include stone blocks (granite or trap-rock), wood blocks, vitrified brick, bituminous concrete or bitulithic, cement concrete and broken stone (Telford or Macadam).

Much of the recent advance in the art of laying pavements has been due to the study of the functions of the pavement foundation. Formerly a hard earth bottom covered with a thick layer of sharp, clean sand was the engineer's desideratum. This practice has been superseded by the cement concrete foundation laid four to 12 inches thick according to the weight of traffic to be sustained. On this any of the various pavements excepting only the broken stone may be laid. This type of foundation is generally constructed as a monolith, but sometimes the loose stone of the concrete is put in place, and then grouted. In either case the surface is as carefully crowned as is the finished pavement. Concrete mixing machines make the work rapid and much less costly than formerly. The machines not only mix the material, but also deposit it anywhere in the width of an ordinary street. On wide streets two machines are used. In this way hand labor has been reduced to a minimum. The concrete foundation is allowed to set hard, which requires several days. If stone blocks or wood blocks or vitrified brick are to be used as the pavement, a layer of sand about an inch deep is spread over the foundation, just enough to bed the blocks. When the pavement is in place, fine gravel is worked into the crevices so as to fill them about one-third of their depth, and hot liquid asphalt is poured into that level. This operation is twice repeated, thus filling the crevices to the pavement level with an absolutely waterproof binder. An asphalt pavement is laid upon the same foundation, the asphalt being mixed with crushed stone and spread in a layer some six inches deep, and solidified while still hot with a steam roller. Upon this layer is spread a two-inch layer of a sandy texture and a little richer in asphalt. The bitulithic pavement differs from the ordinary asphalt type in being a true bitumen concrete. The aggregate is made up of stone of various sizes:—to quote from a recent specification: "Not more than 11 nor less than 5 per cent to pass 200-mesh; from 18 to 30 per cent to pass 40-mesh; from 25 to 55 per cent to pass 10-mesh screen; from 8 to 22 per cent to pass 4-mesh screen; not more than 10 per cent to pass the 2-mesh screen. The bitumen factor is stipulated to be at least 7 per cent and not more than 11 per cent. This pavement is also laid hot and rolled down with a heavy steam roller."

Concrete pavements are generally laid in monolithic form, a single layer the full thickness of the pavement. They are laid in sections with expansion joints between, the latter being filled with asphalt. They are also laid upon old and wornout pavements in the form of grouting. The Telford and Macadam pavements depend upon the natural binding character of broken stone packed together. There is no foundation laid for this type, the larger stone being placed at the bottom, and the pavement built up with graded smaller pieces, and the whole covered with a top-dressing of finely crushed stone. These pavements are not waterproof, as are the others described, and drainage from the bottom of the pavement must be provided for.

The estimated life of a newly laid granite block pavement is 25 years; its first cost (1914) about \$3.50 per square yard; and the average cost of maintenance, 12 cents per square yard. Treated wood block pavement costs \$3 to \$3.50 per square yard, lasts 20 years, and costs 15 cents to 18 cents per yard to keep in repair. Vitrified brick costs \$3 per square yard, lasts 15 years, and costs 24 cents a yard annually for repairs. Asphalt and bitulithic pavements cost from \$2 to \$2.35 per square yard, last about 18 years, and cost for annual repairs about 28 cents per yard. Telford and Macadam pavements cost about \$1 per square yard, last about 10 years, and cost about 18 cents a yard for repairs for the first two or three years, and up to 50 cents a yard for the following years.

T., 'Modern Road Construction' (Chicago 1917); Mullen, C. A., 'Paving Economy, Road and Street' (Montreal 1916); Spalding, F. P., 'Textbook on Roads and Pavements' (New York 1912); Tillson, G. W., 'Street Paving and Paving Materials' (New York 1912).

PAVIA, *pā-vē'ā*, Italy, (1) a city of Lombardy, 19 miles by rail southwest of Milan, capital of a province of the same name. It is beautifully situated on the left bank of the Ticino, here crossed by a bridge of eight arches, about two miles above its confluence with the Po. The bridge, of stone and brick, is covered with a curious roof supported by 100 granite pillars. Until 1876 Pavia was surrounded by its mediæval walls, three miles in circuit, which have been replaced by handsome boulevards and public gardens. The Corso Vittorio Emanuele traverses the city centrally from south to north and contains its most important edifices, of which the chief are the cathedral, a large, heavy, unfinished structure, begun in 1486, crowned with a lofty dome and containing some good paintings, and a beautiful side chapel with the tomb of Saint Augustine; San Michele, a heavy marble edifice in the Romanesque style belonging to the latter part of the 11th century; Santa Maria del Carmine, a fine brickwork, Gothic church of imposing exterior, built in 1375, and possessed of good pictures; Santa Maria di Canepanova, in the *cinque-cento* style, by Bramante; and San Francesco, a 14th century building, with a mutilated façade of pure Italian Gothic. Other edifices deserving of notice are the Castello or Castle, erected by the Visconti, 1360-69, on the site of the old palace

of the Lombard kings, now fitted up as a barrack; the municipal buildings; and several towers, once so numerous that Pavia was sur-named "the city of the hundred towers." The university, founded, it is said, by Charlemagne in 774, is one of the oldest in Italy, and about the beginning of the 16th century was attended by about 3,000 students. It has faculties of law, philosophy, science and medicine. The buildings have several quadrangles surrounded by handsome arcades embellished with statues, busts, etc.; the library has about 136,000 volumes, and the collections include, among others, an excellent anatomical museum. There are also three colleges, a gymnasium, an ecclesiastical seminary, a school of painting, a school of design and sculpture and a municipal museum, an institute of fine arts; also a botanical garden. The public monuments include a statue of Italia and a monument of Garibaldi (1884). The chief charitable endowments are a large general hospital and a military hospital. Pavia has numerous modern industrial establishments, including iron foundries, engineering works, electric supply works, chemical works and cement factories, and it does an extensive business in wine, oil, rice, cheese, silk and fruit. About four miles north of the city is the Certosa di Pavia, an old Carthusian monastery, now classed as a "national monument," with a magnificent Gothic church adorned with a splendid façade, among the finest decorative works of North Italy. Pavia was a place of considerable importance during the reign of Augustus. It afterward came into the possession of the Lombard kings, who made it their capital and erected many edifices, more remarkable for magnitude than taste. Near it, on 24 Feb. 1525, the Imperialists defeated the French and took their king, Francis I, prisoner. Pavia has given birth to many distinguished men, among whom were Pope John XIV and Lanfranc. Pop. about 40,000. (2) The province of Pavia, which extends on both sides of the Po, has an area of 1,288 square miles.

PAVIA, a province of Italy, in the Lombardy country. Through it run the Po, Ticino and other northern streams. The land is generally level and has long been noted for its fertility. Historically it is one of the best known districts of Italy and has been the scene of many fierce struggles. It contains an area of about 1,290 square miles and a population of over 500,000. Its capital is Pavia (q.v.). Its principal products are cattle, silk, cheese, wine, rice and oil.

PAVIA, Philippines, pueblo, province of Iloilo, island of Panay; at the junction of the Tigón and Aganan rivers, eight miles northwest of Iloilo, the provincial capital.

PAVILION, in architecture, a turret or small building, usually isolated, with a tent-like roof. The name is also applied to a projecting portion of any building having a tent roof. The term pavilion was originally applied to any light open structure with a roof or canopy so provided as to give protection. It was so called on account of its butterfly appearance. This sense of the word is also used in the name "pavilion hospitals" applied to the wings of hospitals. French architects call a prominently high, narrow portion of a building, especially if it has a high roof, a pavilion. See TENT.

PAVING. See PAVEMENTS.

PAVISE, pāv'is, or **PAVISOR**, in the Middle Ages, a large shield covering the entire body, and carried by a soldier for his own protection, as well as that of the archer before whom he stationed himself. The pavise was often six feet in height.

PAVLOV, a volcano of the Alaskan Peninsula in long. 160° W., with an elevation of 7,500 feet above-sea-level. Its last active period was in 1903.

PAVY'S SOLUTION, a modification of the well-known Fehling's solution for the volumetric determination of glucose and other reducing sugars, so named from Frederick William Pavy 1829-1911, the English physician-specialist, author of 'Researches on the Nature and Treatment of Diabetes' (London 1862), etc. An alkaline copper sulphate solution similar to a Fehling's solution is made to which a sufficient quantity of ammonia water is added to hold in solution all the copper when precipitated as cuprous oxide. The "end point" of the analysis is determined by the disappearance of the blue color of the solution. See FEHLING'S SOLUTION.

PAWN. See PLEDGE.

PAWNBROKERS (from "pfant," "pawn," a pledge, Old English), a class of small shopkeepers whose business is the loaning of money on personal pledges. In the United States and in Great Britain the business has assumed large proportions especially in the crowded sections of metropolitan cities. The usury and other abuses to which the necessities of borrowers of this class are liable has led on the Continent to the establishment of charitable institutions (see MONT-DE-PIÉTÉ), where the business is conducted on benevolent principles. In Great Britain the same plan has been tried, but it has failed. The object which has been aimed at by monts-de-piété has here been attempted to be accomplished by placing the trade under certain legal restrictions. In most Latin countries and in Latin-American nations the pawnshops thrive to a degree unknown in English-speaking countries. There the pawnshop may be said to be a national institution; and the town must be a very small one indeed if it does not possess at least one pawnshop. In all Latin-American countries pawnshops are subject to strict legal restrictions; yet they do a thriving business in opposition to the government "Montes de Piedad." In the Middle Ages lending upon pledges was a trade almost exclusively pursued by Jews and Lombards. In France, before the establishment of monts-de-piété, the trade was regulated by law. During the Revolution the monts-de-piété were at first abolished as a monopoly, but the abuses to which the restoration of private pledging gave rise soon led to their re-establishment and the prohibition of private pledging, which is still maintained.

The common law recognizes the property of the pawner in the goods he has pledged, which cannot be forfeited by, or taken in pledge for, the debts of the pawnee, who is responsible for their safe-keeping. On the other hand, the pawnee is recognized as having a qualified property in the goods, which cannot be put in execution by a creditor of the pawner till the debt

for which they are pawned is satisfied. The property of goods of which the pawner is outlawed is in the king. Perishable goods are at the risk of the pawner, if he does not redeem them in time. Goods pawned without a fixed time of redemption may be redeemed at any time within the life of the pawner. A broker who refuses to deliver goods pawned on tender of payment may be indicted. Both in Great Britain and the United States the pawnbroking business is regulated by law and in most States in this country licenses must be taken out and renewed annually. The pawnbroker is to use books and schedules as provided by law. The name and surname of the broker, together with the word "pawnbroker," are to be put in large characters over the outer door of his shop. The information to be printed on pawn tickets must also be posted in a conspicuous part of his shop. Pawn tickets are to be given for pledges. Profits and charges are fixed by a schedule, of which the following are the principal provisions: Rate of interest on sums of \$100 and under, 3 per cent per month or fraction of a month for the first six months and 2 per cent per month for the following six months; on sums over \$100, the rate is 2 per cent a month for the first six months and 1 per cent a month for the second six months. The ticket is good for one year only, but can be renewed upon payment of interest. If a person offers an article in pawn without giving a satisfactory account of the way in which he became possessed of it, or attempts to redeem an article without title, he may be detained by the broker and handed over to the police to be brought before a justice and dealt with according to law. Goods entrusted to another by the owner for manufacture, repair, etc., cannot be pawned; and the owner may, on making oath that he believes a pawnbroker to have taken such goods, obtain a warrant to search his premises.

Under the law a poor person pawning a piece of jewelry valued at \$20 is compelled to pay interest to the pawnbroker at the rate of \$6 a year. In four years, if he requires the loan for such a length of time, he will have paid \$24 interest or \$4 more than the value of the loan. To relieve this condition of legal usury there was established in New York city in 1891, a Provident Loan Society, with a main office and numerous branch offices, where under a special charter loans could be made at a reduced rate of interest. The Provident Loan Society was organized by a number of New York philanthropists for the express purpose of relieving the poorer classes. Its capital was increased in 1910 to \$5,000,000. The society has met with great popularity and while primarily a charitable enterprise, has been conducted at a small profit. The Provident Society rate of interest is 1 per cent a month or any fraction thereof, on small loans and 10 per cent a year on larger loans. A loan of \$20 costs the borrower \$2 a year as against \$6 charged by the pawnbroker. The monts-de-piété of France are associated with hospitals, charity bureaus and city and town councils. The highest interest charged by them is 1 per cent a month; and in many cases, where the "mont" is endowed, little or no interest is exacted. In Belgium the French system of monts-de-piété is followed and in both countries it is illegal for private individuals to

carry on a pawnbroking business. In Paris and some other large cities the "monts" act as savings banks for laboring classes.

In Germany any city may prohibit pawnshops; and many have done so. By law there are German government, municipal and private pawn shops. One of the oldest of the Imperial pawnshops of Europe is that of Vienna known as the "Imperial Pawn Shop." It was founded by Joseph I in 1707. In Russia the pawnshop business has long been in the hands of individuals; and there are only two cities in the empire, Petrograd and Moscow, which have national pawnshops. (See GOVERNMENT PAWN-SHOPS IN FRANCE). Consult Levine, S. W., 'A Treatise on the Law of Pawnbroking' (New York 1911); 'The Business of Pawnbroking' (New York 1913); Tyler, R. H., 'Usury, Pawns or Pledges' (Albany 1873); 'Report of Her Majesty's Representatives Abroad on Systems of Pawnbroking in Various Countries' (London 1894); United States Bulletin of the Department of Labor, No. 21 (Washington 1899).

PAWNEE INDIANS, (the "horn-wearers," a name originating from their peculiar manner of wearing their hair), an American tribal confederacy belonging to the Caddoan family. The Pawnees called themselves "Chahiksichhiks," "Men of Men." They formerly resided in large numbers in the region now known as Nebraska, with cognate branches extending as far south as Texas. They were in constant warfare with every surrounding tribe, with the exception of the Omahas, Poncas and Otos. The Pawnees were known to the Spaniards as early as 1626 and they are noted on Marquette's map of 1673. By the ordinance of 1709 the enslavement of Negroes and Pawnees was made legal in Canada. Half a century earlier the settlers in New Mexico had already become well acquainted with the Pawnees, who frequently raided their settlements to secure horses, arms, clothing and provisions. This hostile attitude of the Pawnees continued for more than 200 years. Gradually however, they came into closer contact with the traders, who introduced among them the vices of white civilization; and when the Louisiana Purchase agreement transferred their territory to the United States, they were brought into still closer relationship with the whites in all the region lying between their home and Saint Louis, then the great Indian trading centre of the middle west. The trails to the west and to the southwest which passed through the Pawnee country helped still more to accentuate the changes which had already begun to take place in the people who continued their friendly relations with the whites, when practically all the other Indian tribes of the west were opposing the westward march of civilization. Many of them rendered good service as scouts in the United States army. Numerous treaties have been made and kept between the Pawnees and the American government. In 1818 most of the Pawnee tribes met in Saint Louis and concluded a peace with the United States and seven years later they recognized the sovereignty of the United States over themselves and their lands; and by various other subsequent treaties and agreements they gave up their right to the vast territory that they once lorded over. In 1876 the tribes finally removed to their reservation in Oklahoma where they

now reside. Sixteen years later they divided up their lands *pro persona* and became American citizens.

The religion of the Pawnees was one of the most interesting of the aboriginal tribes of the United States. They were nature worshipers and they personified the winds, the storms and the elements in general, all of which were messengers and attendants of Tirawa, the great Father. Their religious observances included several series of elaborate and picturesque ceremonies all of which were in charge of a powerful priesthood. The Pawnee people were imaginative and their ceremonies, myths and folktales are rich in symbolism and imagination. They also had numerous secret societies connected with their religious rites, ceremonies and superstitions. They cultivated Indian corn, pumpkins and beans, gathered wild rice and fruit and prepared jerked buffalo and other meats for winter use. They were excellent weavers, made pottery and artistic baskets and constructed warm and durable earth houses. In 1838 the Pawnees were estimated at over 10,000, while other estimates made them over 12,000. They now number probably less than 1,000. Consult Dorsey, G. A., 'The Pawnee Mythology'; 'Traditions of the Skidi Pawnee' (1904); Dunbar, 'Pawnee Indians' (1880); Fletcher, 'The Hako' (1903); Grinnell, 'Pawnee Hero Stories' (1889); Winship, 'Coronado Expedition' (1896).

PAWNEE ROCK. A rocky bluff jutting out into the valley of Arkansas River a short distance from the village of Pawnee Rock, Kan. It is on the old Santa Fé trail and is famous for having been the scene of many encounters between the Indians and whites. The names and initials of travelers, from the early trappers to the forty-niners, are scratched on the smooth ledges of Dakota sandstone of which the rock consists.

PAWNHOPS IN FRANCE. See GOVERNMENT PAWNHOPS IN FRANCE.

PAWTUCKET, pā-tūk'ēt, R. I., city in Providence County, on both sides of the Blackstone River, at the head of deep-water navigation on the Pawtucket River and on the New York, New Haven and Hartford Railroad, four miles north of the business centre of Providence, and about 40 miles south by west of Boston. The city is connected by electric lines with many parts of Providence and with the nearby cities and towns. A fall of 50 feet in the Blackstone River at this place, together with the rapids, furnishes extensive water power which has been instrumental in making Pawtucket an important manufacturing centre. The area is about nine square miles. Pawtucket was settled about 1654. The part of the city on the east side of the river was originally in Bristol County, Mass. In 1862 it came into possession of Rhode Island. The west part of the city was a village in the town of North Providence. In 1874 this town was divided and the "East Side" and "West Side" were incorporated as a town, and chartered as a city in 1886. The factory system of Rhode Island began April 1790, when a copartnership was established in Pawtucket for carrying on the spinning of cotton. Samuel Slater (q.v.), one of the partners, constructed a complete set of machines on which was made the first cotton

thread spun by water power in the United States. The first cotton factory building, which was the first in the United States, is still standing. The chief manufactures are cotton and woolen mills, silk factories, foundries, machine shops, electrical supply works, wire works, yarn mills, hosiery mills, knit-goods factories, textile dyeing and finishing establishments, meat-packing plants, lumber mills and lumber products, factories, boot and shoe factories, jewelry works, paper and wagon and carriage factories. The city receives annually large quantities of lumber, shingles and lath, cotton, coal, building-stone, brick, lime and cement. The Federal census for 1909 gives for Pawtucket over 300 manufacturing establishments, having a combined capital of over \$40,000,000; over 16,000 employees; products, \$37,696,000. The increase from 1904 on the value of products was 47 per cent; increase of number of establishments, 26 per cent. Pawtucket has numerous fine churches and public and parish schools, a high school, English and classic school (private), a public library, founded in 1876, and several private business and industrial schools. Its proximity to Providence gives Pawtucket the advantage of the educational institutions of that city. It has one Home for the Aged Poor (Roman Catholic), the Emergency State Hospital and societies for the amelioration of the poor. Several fine bridges cross the river. It has a State armory, Dagget Park and several other smaller parks or squares which beautify the city. A number of the business buildings and blocks have considerable architectural merit. The annual municipal expenditures for maintenance and operation are about \$840,000. The chief items of expense are, for schools, \$243,000; for waterworks, \$78,000; for police department, including truancy, etc., \$73,000; fire department, \$86,000; municipal lighting, \$39,200. The city owns and operates the waterworks, which were opened in 1878, and which cost originally \$1,333,000, and have since been enlarged at a cost of \$500,000. Pop. (1920) 64,248. Consult Davis (ed.), 'The New England States,' Vol. IV, pp. 2,533-2,534; Greene (ed.), 'The Providence Plantations'; Grieve, Robert, 'Illustrated History of Pawtucket' (Pawtucket 1897).

PAX, in Latin, peace, (1) in Roman mythology, the goddess of peace; (2) in ecclesiastics, a utensil in the Roman Catholic Church, formed usually of a plate of metal, chased, engraved or inlaid with figures representing the Virgin and Child, the crucifixion, etc., which, having been kissed by the priest during the *Agnus Dei* of the high mass, is handed to the acolyte, who presents it to be kissed by each of the ecclesiastics officiating, saying to them *Pax tecum* (peace to thee). The decorations of the pax are frequently very rich. The "kiss of peace" was a custom or ceremony in use at very early times among Christians; and it would seem that it arose out of the practice of the men, women and children of the Christian sect saluting one another with kisses when they met together for public worship. This is more than probable since kissing in this way was an Oriental custom to which the Jews had taken previous to the Christian era.

PAXO, pāk'sō (ancient **Paxos**, pāk'sōs), the smallest of the seven Ionian Islands (q.v.), lying eight miles southeast of Corfu. It is

rocky, rises to a height of 800 feet, and has no fresh water supply, but is fertile, producing excellent olive oil, citrons, oranges and almonds. Facing it is the island of Antipaxos, which with it forms an eparchy in the administrative nome of Kerkyra, an island to which both Paxos and Antipaxos belonged in ancient times. Area, sever square miles; pop. about 5,000. Consult Ludwig Salvator, 'Paxos und Antipaxos im Ionischen Meere.'

PAXSON, Frederick Logan, American historian: b. Philadelphia, 23 Feb. 1877. In 1898 he was graduated at the University of Pennsylvania and subsequently studied at Harvard. In 1903-06 he was connected with the department of history of the University of Colorado. In 1906 he was appointed assistant professor of American history, in 1907 junior professor at the University of Michigan, since 1910 he has been professor of American history at the University of Wisconsin. He also taught American history at the summer sessions of the University of Chicago (1909), California (1913), Michigan (1915) and Pennsylvania (1917). In 1910 Mr. Paxson was research associate of the Carnegie Institution. He has published 'The Independence of the South American Republics' (1903); 'The Last American Frontier' (1910); 'The Civil War' (1911); 'The New Nation' (1915); 'Guide to Materials for United States History since 1783, in London Archives' (1914), with C. O. Paullin; also reviews and papers on American diplomacy, transportation and the history of the far West. He edited the 'War Dictionary' (1917, published by the Committee of Public Information).

PAXTON, paks'ton, Sir **Joseph**, English landscape-gardener and architect: b. Milton-Bryant, near Woburn, Bedfordshire, 3 Aug. 1801; d. Sydenham, 8 June 1865. He became superintendent of the gardens of the Duke of Devonshire at Chatsworth, in Derbyshire, where he designed the great conservatories. He also designed the Crystal Palace for the London International Exhibition in 1851, and soon after was knighted. In 1853-54 he superintended the erection of the new Crystal Palace at Sydenham. He was a Liberal member of Parliament for Coventry from 1854 until his death. He edited the 'Horticultural Register'; the 'Magazine of Botany'; the 'Cottage Calendar'; and was the author with Lindley of a 'Botanical Dictionary' (1840); and 'Paxton's Flower Garden' (1850-53), and independently of 'A Practical Treatise on the Cultivation of the Dahlia' (1838).

PAXTON, William McGregor, American artist: b. Baltimore, Md., 22 June 1869. He studied under Bunker in Boston and at the École des Beaux-Arts of Paris. He painted a portrait of President Cleveland and portraits of many other prominent persons. He has exhibited at leading exhibitions in the United States and is represented in the permanent collections of the Metropolitan Museum of Art and the Pennsylvania Academy of Fine Arts, the Boston Museum of Fine Arts, the Corcoran Gallery, Washington, D. C., and the Cincinnati Museum of Art. In Philadelphia is his 'Girl Sweeping' and in New York 'Tea Leaves' and 'Sylvia.'

PAXTON, Ill., city, county-seat of Ford County on the Illinois Central and the Lake Erie and Western railroads, 81 miles east of Peoria. It is in an agricultural region, a shipping point for farm produce and livestock and contains flour mills, brick and tile works, carriage, canning, furniture, broom and tile factories. It is the seat of the Rice Collegiate Institute, a coeducational secondary school under the auspices of the Congregational church. It has waterworks and an electric-light plant, the former being owned by the city. Pop. about 3,000.

PAYAGUA (pā-yā-gwā') **INDIANS**, a South American tribe residing in Paraguay. They were formerly very numerous in the Chaco region near Asuncion. They live in the swampy and wooded regions and consequently did not so much feel the pressure of civilization. Of late years they have decreased through absorption into the mestzos. The Payagua, also spelled Payaya, was a very prominent Coahuiltecan tribe who occupied the region of Texas along the San Antonio River. Their headquarters were near the site of the present city of San Antonio when they were first known by the whites. At the time when the Spanish missionaries were colonizing and Christianizing Southern Texas the Payagua occupied territory from the Rio Grande to the Brazos. They became very much attached to the missionaries and took to mission life. Later on they seem to have been, at last, partially fused with the Xarame whom the priests had moved, with the mission, from the Rio Grande northward into the neighborhood of San Antonio. Both tribes have become extinct, at least in so far as maintaining any tribal organization is concerned.

PAYER, pī'ēr, **Julius von**, Austrian painter and Arctic explorer: b. Schönau (near Teplitz) 1 Sept. 1842; d. 1915. Educated at the military college of Wiener-Neustadt, he entered the Austrian army in 1859, and distinguished himself at Custoza. While stationed in northern Italy he explored several groups of mountains in the Alpine region; in 1869-70 took a prominent part in the second German north-pole expedition; and with Weyprecht directed an Austrian polar expedition which penetrated the sea between Nova Zembla and Spitzbergen and reached 79° north latitude (1871). In 1872 Payer and Weyprecht in a second expedition were hemmed in north of Nova Zembla in lat. 76° 30' N. They discovered the archipelago which they called Franz Josef Land (q.v.) in honor of the emperor, and Payer made a sledge journey through it almost to lat. 83° N. (24 March-26 April). After his return in 1874, Payer withdrew from the military service, studied art, and in 1884 exhibited his first important picture, 'The Bay of Death.' Others of his works are 'The Death of Franklin'; 'Abandoning the Ship'; 'Religious Service'; and his best, 'Never to Return.' He won medals in Munich (1883), Berlin (1886), and Paris (1889). Among his writings is, 'Die Österreich-Ungarische Nordpolexpedition in den Jahren 1872-74' (1876).

PAYMASTER-GENERAL, in the United States navy, the chief officer of the Board of Supplies and Accounts. In the United States Marine Corps the paymaster-general is the chief officer of the pay department. In the British

government the paymaster-general is a civil officer having the grade of minister ex officio; receiving the moneys appropriated by Parliament for the various State departments, and disbursing them in accordance with the orders of Parliament. The actual work of his office is conducted by a permanent staff headed by the assistant paymaster-general.

PAYMENT, in law, the discharge of a legal obligation by the delivery of money, or whatever is accepted by a creditor in lieu of money; but the creditor is not required, by law, to accept anything in payment except legal tender money. Payment should be made at the exact time and place agreed upon, or implied by law. Where no place of payment is designated the debtor must seek the creditor. If he fails to do this he may be considered in default. The effect of a valid payment is to discharge the debtor from his obligation. Payment must be made to the proper party, either to the person to whom the debt is due, or to his legal representative. In case of default of payment the creditor is entitled to proceed by process of law to enforce same. (See **CONTRACT**). Where payment is made to one of several joint creditors, the debt is considered legally discharged even though the person receiving the money fails to account for it to his associates. See **DEBTOR**; **CREDITOR**; **LEGAL TENDER**.

PAYN, pān, **James**, English novelist: b. Cheltenham, 28 Feb. 1830; d. London, 25 March 1898. He was educated at Eton and Cambridge and was editor of *Chambers' Journal*, 1859-71. In 1882 he succeeded Leslie Stephen (q.v.) as editor of the *Cornhill Magazine*, retaining this position till 1896, when failing health obliged him to relinquish it. For many years he wrote exclusively for *Chambers' Journal*, and from 1888 the page of 'Weekly Notes' in the *Illustrated London News* was from his pen. The long series of his books begins with 'Stories from Boccaccio' in 1852, and closes with 'The Backwater of Life,' which appeared in 1899, the 69th work of which he was the author. 'Lost Sir Massingberd' (1864) is the best known of his works, and its appearance in *Chambers' Journal* raised the circulation of the periodical 20,000 copies, and permanently established his popularity. Though in no sense an imitator of Dickens, Payn was not a little influenced by the manner of the elder novelist. He possessed a lively, fluent style, an abundant fund of humor, and many popular writers of the present owe to him in his editorial capacity the first recognition of their talents. He was as much read in this country as in his own, and among the best of his books may be cited in addition to those already named: 'Carlyon's Year' (1868); 'Gwendoline's Harvest' (1870); 'Cecyl's Tryst' (1872); 'At Her Mercy' (1874); 'Fallen Fortunes' (1876); 'By Proxy' (1876); 'A Grape from a Thorn' (1881); 'The Heir of the Ages' (1886); 'The Eavesdroppers' (1888); 'Gleams of Memory' (1894); 'The Burnt Million' (1894); 'In Market Overt' (1895); 'Another Burden' (1897); 'The Backwater of Life' (1899, a collection of essays published after his death).

PAYNE, Charles Henry, American Methodist Episcopal clergyman and educator: b. Taunton, Mass., 1830; d. 1899. In 1856 he was graduated at Wesleyan University and subse-

quently studied at the Concord (N. H.) Biblical Institute. In 1857 he entered the ministry of the Methodist Episcopal Church. He held pastorates until 1876 and from 1876 to 1888 he was president of Ohio Wesleyan University. Thereafter until his death he was secretary of the Board of Education of the Methodist Episcopal Church. In 1876 Dr. Payne served on the committee of revision of the 'Methodist Hymnal.' He published 'Guides and Guards in Character Building.'

PAYNE, David L., American soldier, pioneer and adventurer: b. near Fairmont, Grant County, Ind., 30 Dec. 1836; d. Wellington, Kan., 27 Nov. 1884. His mother was a first cousin of Davy Crockett (q.v.). His education was meagre as that of the average country lad of his times but he was always an eager reader. At the age of 21, he became a pioneer in Doniphan County, Kan. He entered the volunteer military service as a private at the outbreak of the Civil War and served three years. In 1864 he was elected to the State legislature and also served as a captain of militia during the Price Raid. He again entered the army as a private in the 18th Regiment of the United States Veteran Reserve Corps, with which he was at Appomattox. In 1867 he was commissioned captain of a troop of cavalry in the 18th Kansas battalion, which was recruited and organized for service against the Indians of the plains. In 1868, he received a similar commission in the 19th Kansas Regiment, raised for a similar purpose. In 1870, he settled on a homestead in Sedgwick County, Kan., whence he was sent to the State legislature in 1871. He then spent several years in the Rocky Mountains. Afterward he secured employment as an assistant doorkeeper of the House of Representatives, at Washington, until the summer of 1879, when he returned to Kansas and became interested in the movement to settle on vacant public lands in the Indian Territory. He soon became the recognized leader of the "Oklahoma movement," as it was known and, during the ensuing five years, was almost constantly employed in organizing and agitating the proposed settlement in the forbidden lands. He led no less than eight invasions into the Oklahoma country, being arrested and removed as an intruder in each case by the Federal authorities. Essentially a soldier of fortune, outwardly frank and generous, of robust and picturesque physique and possessed of a personality that was not lacking in magnetism, he easily became a hero in the eyes of the "colonists" or "Boomers," as his followers were called, and they believed him capable of martyrdom in a holy cause. With the cool calculation of a demagogue and the swagger of a knight errant he combined the talent of an actor which enabled him to artfully play his part to the end. Yet, notwithstanding his obliquities and shortcomings, his success as an agitator made possible the opening of Oklahoma to white settlement much sooner than it would have been done otherwise and his picturesque career in that capacity was so unique as to insure him an indisputable place in the history of that State. While organizing another "colony" to invade Oklahoma, Payne died very suddenly. Payne County, Okla., was named in his honor.

PAYNE, Henry B., American statesman: b. Hamilton, N. Y., 30 Nov. 1810; d. Cleveland, Ohio, 9 Sept. 1896. He was graduated from Hamilton College in 1832, studied law and in 1834 removed to Cleveland, where he was admitted to the bar and established a law practice. In 1846 he entered politics, was State senator in 1849, and in 1860 attended the Charleston Convention, where he vainly endeavored to check secession sentiment. Throughout the war he was a strong Union man, and in 1872 was a member of the convention which nominated Horace Greeley for President. He was elected to Congress in 1874, in 1880 and 1884 was a candidate for the Democratic presidential nomination, and in 1885-91 was United States senator. He was for many years actively connected with industrial, railway, mining and other enterprises.

PAYNE, Henry Clay, American financier and politician: b. Ashfield, Mass., 23 Nov. 1843; d. Washington, D. C., 4 Oct. 1904. He was educated at Shelburne Falls Academy, Mass.; in 1863 went to Milwaukee, Wis., where he entered business as cashier in a drygoods store, and rose from this position to be one of the leading business men and financiers of the State. From 1886 he was president of the Wisconsin Telephone Company, and from 1889 president of the Milwaukee Electric Light and Railway Company; he was president of the American Street Railway Association in 1893-94, and was appointed receiver for the Northern Pacific Railroad in 1893. He was also active in politics and served as the secretary and chairman of the Republican county committee and of the State central committee. He was a member of the Republican national committee from 1880 till his death, and vice-chairman of the executive committee. For years he attempted to have the representation of each State in the Republican national conventions based on the actual Republican vote and not the representation of the State in Congress. From 1876-86 he was postmaster of Milwaukee, and in 1902 was appointed United States Postmaster-General in President Roosevelt's cabinet, a position he retained till his death.

PAYNE, John, English poet and Oriental scholar: b. London, 23 Aug. 1842, and later retired to private life to devote his life to literature. He studied for the bar and became a solicitor. He was one of a group of English verse-writers, including also O'Shaughnessy (q.v.) and Marzilos (q.v.), that followed the leadership of the pre-Raphaelite poets. Among his original volumes are 'A Masque of Shadows' (1871); 'Intaglios' (1871); 'Songs of Life and Death' (1872); 'Lautrec' (1878); and 'New Poems' (1880). He also made English renderings of Villon (1878), the 'Arabian Nights' (1882-84) 'Quatrains of Omar Khayyam' (1898); and 'Poems of Shemseddin Mohammed Hafiz of Shiraz' (1901); 'Flowers of France' (poems from Ronsard and Saint-Amant) (1907). See 'Poetical Works of J. Payne' (2 vols., London 1902); 'Selections from the Poetry of John Payne' (New York 1906).

PAYNE, John Howard, American actor and dramatist, author of 'Home, Sweet Home': b. New York, 9 June 1791; d. Tunis, Africa,

10 April 1852. The date of his birth is commonly given as 1792, evidently because of an effort on some one's part to exaggerate his remarkable precocity, which was shown at 15, when, having left his boyhood home in East-hampton, Long Island, and having spent several years in Boston, where he was consumed with stage-fever, he became a clerk in a New York counting-house and spent his spare hours editing *The Thespian Mirror*. After two years in Union College in 1809 he made his first appearance on the stage as Young Norval in the Park Theatre, New York. A tour to London, 1812-13, followed, and there he wrote several dramas and adopted others, usually from the French. These are almost forgotten now. In 'Clari, or the Maid of Milan,' an opera, appeared the song 'Home, Sweet Home.' It was produced at the Covent Garden Theatre in 1823, and the music of the song was adapted by Henry R. Bishop from an old Italian melody. Payne knew intimately many English literary persons and corresponded with Coleridge and Lamb. In 1818 he brought out his very successful tragedy, 'Brutus,' in which he would have taken the title rôle but for the objections of his manager, Kean, who became famous in the part. He renewed his labors as a critic of the stage, begun in *The Thespian Mirror*, in London during 1826-27, as editor of *The Opera Glass*. He returned to New York in 1832, and in spite of the handsome sums received for 'Brutus,' 'Virginius' and 'Charles the Second,' was continually in financial embarrassment. In 1841-45, and from 1851 to his death, he was United States consul at Tunis. His body was removed thence to Washington, D. C., in 1883. His homeless, wandering life adds pathos to his great and well-known song. Consult Brainard, C. H., 'John Howard Payne'; Harrison, Gabriel, 'John Howard Payne' (1875), with an appendix containing Payne's juvenile poems and some of his dramatic criticisms; Hanson, W. T., 'Early Life of John Howard Payne' (Boston 1913).

PAYNE, Joseph, English educator: b. Bury Saint Edmunds 1808; d. 1876. He gained an education practically through his own efforts, and in 1830 founded a grammar school for boys, which later became widely known as the Denmark Hill Grammar School. The Mansion House School at Leatherhead was founded by Mr. Payne in 1845. In 1872 Payne was appointed professor of the theory and practice of education at the College of Preceptors. He condemned the Eton system as undemocratic and otherwise defective. He was the author of 'Lectures on the Science and Art of Education' (1883) and 'Lectures on the History of Education, with a Visit to German Schools' (1892).

PAYNE, Oliver Hazard, American capitalist: b. Cleveland, Ohio, 1842; d. 27 June 1917. In 1863 he was graduated at Yale University and served with the Ohio infantry in the Civil War, retiring with the rank of brigadier-general of volunteers in 1865. In the following year he entered the iron manufacturing field at Cleveland and subsequently added oil refining to his interests. After 1884 he carried on his business in New York. He was a director of the Standard Oil Company and of the American Tobacco Company. Mr. Payne also served as

vice-president of the Tennessee Coal, Iron and Railroad Company. He gave \$500,000 to help establish the Cornell Medical School, and in 1913 endowed it with the sum of \$4,500,000. The University of Virginia and Western Reserve were other institutions which benefited by Mr. Payne's gifts.

PAYNE, Sereno Elisha, American lawyer and legislator: b. Hamilton, N. Y., 1843; d. 1914. In 1864 he was graduated at the University of Rochester, studied law and in 1866 was admitted to the bar. He became member of a law firm at Auburn and soon took an interest in Republican politics. He was successively city clerk, supervisor and district attorney of Cayuga County in the 70's, and from 1883 to his death was a member of Congress, with the exception of the 50th Congress. In 1899-1910 he was chairman of the Ways and Means Committee. He also attended all the Republican national conventions from 1892 until his death. He was a member of the Joint High Commission which met to arrange a reciprocity treaty with Canada. Payne was prominent in all tariff legislation during his time in Congress. He was a conservative of the old type and toward the close of his life found himself at odds with the progressive rank and file of his party. He received the honor of a state funeral in the House of Representatives.

PAYNE, Will, journalist and novelist: b. Whiteside County, Ill., 9 Jan. 1865. He went to Chicago from Nebraska in 1890 and began his career on the *Daily News*; in 1896 was financial editor of the *Chronicle*; 1897-1904 financial editor of *The Economist*. He published 'Jerry the Dreamer' (1896); 'The Money Captain' (1898); 'The Story of Eva' (1901); 'On Fortune's Road' (1902); 'Mr. Salt' (1903); 'When Love Speaks' (1906); 'The Automatic Capitalist' (1909); 'The Losing Game' (1909); and contributed numerous short stories to leading magazines.

PAYNE, William Harold, American educator: b. Farmington, N. Y., 12 May 1836; d. 1907. He was educated in the New York Conference Seminary. In 1858-79 he was State superintendent of the public schools of Michigan and in 1879-88 was professor of science and the art of teaching at the University of Michigan. He was president of Peabody Normal College in 1888-1901, when he was recalled to the University of Michigan. He made translations of various pedagogical works, published monographs and addresses on educational matters, and wrote 'School Supervision,' 'Education of Teachers,' 'Educational Doctrine,' 'Contributions to the Science of Education.' He translated three of Compayré's best known works into English: 'History of Pedagogy,' 'Lectures on Teaching,' 'Elements of Psychology.'

PAYNE, William Morton, American literary critic: b. Newburyport, Mass., 14 Feb. 1858; d. 11 July 1919. He was educated in the public schools; in 1874-76 was assistant librarian in the Chicago Public Library; after 1876 a teacher in the high schools of Chicago; in 1884-88 literary editor of the *Chicago Morning News*, and of the *Evening Journal* 1888-92. From 1892-1915 he was associate editor of *The Dial*. He was lecturer on literature in the University of Wis-

JOHN HOWARD PAYNE

consin in 1900 and in the universities of Chicago and Kansas in 1904, and became known as a critic of the modern prose and poetry of different countries. He published 'The New Education' (1884); 'Little Leaders' (1895); 'Various Views' (1902); 'Editorial Echoes' (1902); 'The Greater English Poets of the Nineteenth Century' (1907); 'Björnstjerne Björnson' (1910); 'Leading American Essayists' (1910). He also made translations from the Norwegian and contributed to numerous magazines.

PAYNE-SMITH, Robert, English theologian and oriental scholar: b. Chipping Campden, Gloucestershire, November 1818; d. Canterbury, 1 April 1895. He was educated at Oxford where he gained the Sanskrit scholarship in 1840 and a Hebrew scholarship in 1843. After taking orders in the English Church he spent a few years in parochial work, and in 1857 was appointed sub-librarian at the Bodleian library. He was regius professor of divinity at Oxford 1865-70, in the year last named becoming dean of Canterbury. He was a member of the Old Testament Revision committee and belonged to the evangelical party in the Establishment. His greatest work was the 'Thesaurus Syriacus' (1868 et seq.), and among his other publications are 'The Authenticity and Messianic Interpretation of the Prophecies of Isaiah Vindicated'; 'Prophecy: a Preparation for Christ'; 'Saint Cyril's Commentary on Saint Luke's Gospel'; 'The Third Part of the Ecclesiastical History of John, Bishop of Ephesus, now first Translated from the Original Syriac.' He also wrote commentaries on Daniel, Genesis, Jeremiah and Samuel.

PAYSANDU, pī-sān-doo', a port and department of Uruguay, and its capital. The city, situated on a hill above the juncture of the San Francisco and the Uruguay, lies 170 miles north of Buenos Aires, with which, as well as with Montevideo, it has steamboat connections. A railroad runs to Montevideo and Salto. Founded in 1782 the city is well built and healthy, ranks all the Uruguayan cities except Montevideo in population, has a good educational system, is the seat of several consuls and an American commercial agent, and is one of the great slaughtering and packing centres of the region. From there come the famous Paysandu ox-tongues. Pop. about 30,000.

PAYSON, Edward, American Congregational minister: b. Rindge, N. H., 1783; d. 1827. In 1803 he was graduated at Harvard subsequently studied theology with his father, who was pastor at Rindge. In 1807 he was appointed pastor at Portland, Me., where he remained until his death, 20 years later. He published several volumes of sermons, which were very popular and caused their author to have more than a local reputation. Asa Cummings published his complete works with a memoir (3 vols., Philadelphia 1846; 2d ed., 1859).

PAYSON, William Farquhar, American author: b. New York, 18 Feb. 1876. He studied at Columbia University, and from 1893-95 was on the staff of the *New York Times*. For two years he was managing editor of *Vogue*, and then took up work as literary adviser and vice-president of the Sturgis and Walton Company, publishers (1909-13). Among his publications are 'The Copymaker' (1897); 'The Title-

mongers' (1898); 'John Vytal' (1901); 'The Triumph of Life' (1903); 'Debonnaire' (1904), which in its dramatic form played throughout the United States in 1905-06; 'Barry Gordon' (1908); 'Periwinkle' (1910); 'Love Letters of a Divorced Couple' (1915).

PAYTA, pī'tā, **PAITA**, Peru, town and port of the northern part of the country, situated in a sort of amphitheatre about the bay. The city is little more than a port for Piura (q.v.), about 35 miles distant, within which a railroad nearly 60 miles long connects Payta. The harbor is excellent and the exports of cotton, tobacco, hides, hats and salt reach an annual value of about \$6,000,000. There is an American consul in the town. Payta was sacked by the pirate Anson in 1741 and was nearly wrecked in 1877 by a heavy fall of rain, reputed the first for 30 years. Pop. (estimated) over 5,000.

PAZ SOLDÁN, pās söl-dān', **Mariano Felipe**, Peruvian geographer and historian: b. Arequipa, Peru, August 1821; d. Lima, Peru, 31 Dec. 1886. He was graduated in law at Arequipa in 1847 and established himself at Lima where he was connected with various government offices, and was at one time secretary to the Peruvian legation at Colombia. He visited the United States in 1853 in order that he might inspect the prison systems, and afterward as director of public works succeeded in making reforms in Peruvian prisons. Under President Castilla he was Minister of Foreign Affairs, and Minister of Justice under Balta. He wrote 'Atlas geográfico del Perú' (1861); 'Historia del Perú' (1866); 'Diccionario geográfico estadístico del Perú' (1877); 'Historia de la Guerra del Pacífico' (1884).

PAZARDJIK, generally known as Tartar Pazardjik, a town of Bulgaria, in Rumelia, 25 miles northwest of Varna, with famous fairs in April. Pop. about 17,000.

PÁZMÁNY, Peter, Hungarian clergyman and author: b. Grosswardein, 1570; d. 1637. At the age of 13 he became a convert to the Roman Catholic Church and in 1587 became a member of the Jesuit Order. Pázmány was the ablest leader of those opposed to the so-called Reformation in Hungary. He was successively provost of Furócz, bishop of Nyitra, archbishop of Esztergom, and after 1629 cardinal primate of Hungary. He founded the Pazmaneum in 1623 and in other ways did much for the cause of education in Hungary. Consult his works edited by Bognár (Budapest 1894 et seq.) and Schwicker; 'Peter Pázmány' (Cologne 1888).

PAZZI, pāt'sē, a wealthy and influential Florentine family which, led by one of its members, Jacopo Pazzi, was implicated in a conspiracy against Lorenzo and Guiliano de Medici in 1478. The plot failed and Jacopo Pazzi and his accomplices were executed.

PEA, an annual vine (*Pisum sativum*) of the family *Fabaceæ*, commonly grown in gardens all over the world. Its botanical variety *arvense* is the field pea. Except in the color of the flowers—white in the garden sorts and various tints of blue in the field varieties—and in the seeds, the two are nearly alike in appearance, since both are climbing vines with pinnate leaves, the odd terminal leaflet being replaced by a branching tendrill. From its home in western

Asia and adjacent Europe, the pea has been taken by man to all civilized countries, but succeeds best in cool climates. It has been cultivated since very early times, its seeds being found in Egyptian tombs, and has developed a very large number of varieties, most of which, because of the plant's great tendency to vary, have disappeared, yet about 200 varieties of garden peas are offered annually by American seedsmen. These may be divided into early, medium and late; dwarf, half-dwarfed and tall; smooth-seeded and wrinkle-seeded; those with edible pods and those whose pods are not eaten by man. The wrinkle-seeded varieties are generally considered superior in flavor to the smooth-seeded, though the "marrowfat" varieties are highly prized by many people. The edible-podded sorts, which are prepared for the table like string-beans, are less popular in the United States than they deserve to be. In general the low-growing, quick-maturing varieties are most popular among market-gardeners. The so-called French peas (*petits pois*) are known to gardeners as the French canner or Turkey pea. The garden varieties are grown mainly for their immature seeds which are used as a vegetable; the field sorts are more widely employed as "split" peas for soup-making, etc. They are also largely used ground for stock food, but for this purpose the meal is generally mixed with other meal to lessen its soddiness. The dried garden peas are also used for soups. The vines of both kinds make excellent fodder and hay, for which purposes peas are often grown with barley or oats. The dried mature vines are used for bedding farm animals.

Peas thrive best upon fairly rich, well drained, loamy soils ranging in quality from heavy clay to light sandy loam, but not very well upon gravelly or sandy soils. They must not be over-supplied with nitrogenous plant-food, because this tends to rankness of vine at the expense of productivity. The fertilizers are preferably applied during the previous year, and the ground is plowed in late autumn and left rough until the spring, when, as soon as the ground can be worked, harrowing and seeding should be done. Spring plowing is also frequently practised. The seed should be sown an inch or two deep, in drills varying in distance apart with the height of the vines, the usual distance being equal to the height. The tall growing varieties are generally supported with "brush" or wire trellises. Except in keeping the surface clean and loose no cultivation should be given since unnecessary disturbance of the soil injures the roots. Field-peas are generally broadcast, but when drilling machines which do not split the seed can be used they are preferable. The plants are hardy, being able to withstand light frosts without injury. They do not, however, succeed well in hot, dry weather, being subject to wilting and mildew, the tall kinds especially. The northern United States and Canada are the chief sources of dried peas in the markets, and these regions furnish practically all of the seed sold by American seedsmen.

Peas, either green or mature, are highly prized as food for man and animals. They are rich in protein and are readily digestible when cooked until they become soft. Immense quantities of green peas are canned, the chief localities of this industry being Maryland, Delaware,

and New Jersey, where special machinery is used not only in their cultivation but in their preparation for canning. Perhaps the most remarkable machine is the "viner," into which the vines are fed as they come from the field, and in which revolving beaters and cylinders remove the green seeds as satisfactorily as a pea-thresher separates the dry one from their pods and vines. The average percentage composition of dried peas is: Carbohydrates, 62.0; protein, 24.6; water, 9.5; ash, 2.9; fat, 1.0. Green peas average as follows: Water, 76.6; carbohydrates, 16.9; protein, 7.0; ash, 1.0; fat, 0.5. Edible-podded varieties average as follows: Water 81.8; carbohydrates, 13.7; protein, 3.4; ash, 0.7; fat, 0.4.

Several more or less closely related plants of the family *Fabaceæ* are called peas, each, however, with a modifying adjective. The best known of these are the following: Everlasting pea (*Lathyrus latifolius*), a perennial, floriferous herb often planted in gardens for ornament, especially for concealing unsightly objects such as rubbish-heaps, stones, etc.; sweet pea (*Lathyrus odoratus*), a well-known garden annual flowering herb described under its popular name; glory pea, glory vine, or parrot's bill (*Clitanthus damptieri*), a tender sub-repent shrub with unique, showy flowers, for which it is cultivated somewhat in greenhouses but has not become widely popular because of its proneness to the attacks of red spider and its difficult management; hoary, pigeon, Toor, Kongo or Dhal pea (*Cajanus indicus*), an Asiatic species widely cultivated in tropical countries for its seeds which are used for food; scurfly pea (*Psoralea spp.*), many herbs, shrubs, and sub-shrubs natives of various countries, where several are used as border plants in gardens; chick pea (*Cicer arietinum*), an annual herb of western Asia and the Mediterranean region where it is largely cultivated for its ripe seeds which are used as food; and sea or beach pea (*Lathyrus maritimus*), a native of seacoasts throughout the Northern hemisphere and valued in rocky and sandy gardens because of its ability to grow under very adverse conditions.

Insect Pests.—Of the score or more insects which feed upon the pea, the most troublesome is probably the green pea louse (*Nectarophora destructor*) of the order Hemiptera. Like other plant lice (q.v.) this insect multiplies very rapidly and in seasons favorable to it does prodigious damage, especially in regions which supply canning factories with peas. Before the middle of June in 1900 the damage was estimated at \$4,000,000, and that of the previous season at \$3,000,000. In one season it spread havoc from New Brunswick to Virginia destroying approximately 50 per cent of the crop. Very early and very late planting have been suggested as preventive measures, as has also the avoidance of two successive leguminous crops upon the same land. As remedies, spraying with kerosene emulsion (see FUNGICIDES) has been tried with indifferent success, but brushing the insects with special machines is more satisfactory. The rows of plants are made far enough apart to permit of horse cultivation, which is given immediately after the brushing, so as to bury the insects before they can return to the vines.

The next most troublesome insect is the pea-weevil (*Bruchus pisorum*) which lays its eggs upon the young pods into which the larvæ burrow, finally transforming to pupæ in the mature seed from which the adults issue during late summer and autumn, although in the North they generally wait until the spring. The adults hibernate, lay their eggs, and die; they do not reproduce in or feed upon stored peas. Fumigation with carbon bisulphide or hydrocyanic acid gas are often resorted to, the seed being enclosed in air-tight receptacles. Holding the seed over for a year in bins from which the beetles cannot escape is also recommended, as is also late planting, this last being thought to obviate egg laying, the insect not living until the peas come into flower.

Of the other insects which do serious injury the following are probably the commonest: Ash-gray blister beetle (*Macrobasis unicolor*) and several of its close relatives. These eat the leaves of peas, beans and several other leguminous plants during early summer, though earlier in the year their larvæ may have helped to hold the grasshoppers in check by eating their eggs. Spraying with Paris green and driving the insects to winrows of straw to be burned are recommended. Several cutworms often do serious injury (see CUTWORM), as does also the boll-weevil (q.v.). The European pea-moth (*Semasia nigricana*), a dreaded pest of foreign fields, is known to be an arrival in Canada and pea growers are dreading the possible spread of the insect. There are also several general feeding insects such as leaf-hoppers and plant-bugs which are occasionally troublesome to the agriculturist.

PEA-CRAB, an English name for *Pinnotheres pisum*, known in the United States as the oyster-crab (q.v.).

PEA RIDGE, Battle of, a battle of the Civil War, fought 7-8 March 1862. Gen. S. R. Curtis had driven the Confederate troops out of Arkansas into Indian Territory, and made his headquarters at Fayetteville in the extreme northwest, when he heard that Van Dorn, with Price, McCulloch, Albert Pike, and some 25,000 men, were rapidly marching against him. The actual effective strength of the Confederates was by the official records, 16,202 infantry and cavalry and about 50 cannon. According to Van Dorn's official report less than 14,000 were brought into the battle. Falling back to Sugar Creek, which half encircles a high plateau cut by ravines, called Pea Ridge, he strengthened his front. Van Dorn thereupon swung his army to the left and reached Pea Ridge in the rear of Curtis, to cut off his communications and reinforcements, thus making his elaborate frontal preparations worthless. Curtis at once faced his army to the rear, his left on the creek and his right on Elkhorn Tavern at the crest of the ridge, the Confederate left being at the latter. On the morning of the 7th the Confederates made a fierce assault, which for a time seemed to carry all before it; but it was in two unrelated divisions. McIntosh and McCulloch on the right ambushed and outflanked Osterhaus; Van Dorn and Price at Elkhorn Tavern decimated Colonel Carr's forces. The latter carried on a seven hours' fight till near the last without reinforcements—which could

not be spared him—so heroically that one-fourth of his troops were killed or wounded. The Confederate right was making a final effort to break the Union line and join the left, when Curtis brought in his last reserves, and in a desperate combat in the woods both McCulloch and McIntosh were mortally wounded; whereupon their troops retreated, and Sigel reinforced Carr and stopped the progress of Price, who was badly wounded. The Federals lost some guns and some ground, being driven half a mile beyond Elkhorn Tavern, which was the headquarters of Van Dorn on the night of the 7th, as it had been of Carr in the morning. On the morning of the 8th the Federals renewed the fight, and Van Dorn, after a hard struggle, retreated. Van Dorn estimated the strength of the Union army at from 17,000 to 24,000. But the official records show their actual strength to have been 10,500 infantry and cavalry and 49 cannon. The Union troops lost 1,351, more than half of them from Carr's division; the Confederates probably lost as many, since Van Dorn says that his loss was between 800 and 1,000 killed and wounded and 300 missing.

PEA-WEEVIL. See BEAN-WEEVIL.

PEABODY, pē'bōd'ī, Andrew Preston, American Unitarian clergyman: b. Beverly, Mass., 19 March 1811; d. Cambridge, Mass., 10 March 1893. He was graduated from Harvard in 1826, studied also at the divinity school, became in 1833 colleague of Nathan Parker at the South Parish Church of Portsmouth, N. H., and soon afterward sole pastor. In 1860 he was made Plummer professor of Christian morals and ethics at Harvard, and this post he held until his resignation in 1881, when he received an emeritus appointment, his attention being thenceforth given chiefly to literary work. In 1862 and 1868-69 he was acting president of Harvard. He was editor of the *North American Review* in 1852-61, and besides more than 100 addresses and special sermons, published several volumes including 'Lectures on Christian Doctrine' (1844); 'Conversation: Its Faults and its Graces' (1856); 'Christianity the Religion of Nature' (1864); 'Reminiscences of European Travel' (1868); 'Manual of Moral Philosophy' (1873); 'Christianity and Science' (1874); 'Christian Belief and Life' (1875); 'Moral Philosophy' (1887); 'Harvard Reminiscences' (1888); 'Harvard Graduates Whom I Have Known' (1890); 'Masterpieces of Cicero' (1912). Consult De Normandie, James, 'Memorial Sermon on Andrew Preston Peabody.'

PEABODY, Cecil Hobart, naval architect: b. Burlington, Vt., 9 Aug. 1855. He was graduated from the Massachusetts Institute of Technology in 1877 and in 1878 was appointed professor of mathematics in the Imperial Agricultural College, Sapporo, Japan. In 1881 he was assistant professor of mechanical engineering at the University of Illinois and in 1883 went to the Massachusetts Institute of Technology where he has been associate professor of steam engineering and, since 1893, professor of naval architecture and marine engineering. He is member of the council of the Society of Naval Architects and Marine Engineers and

Fellow of the American Academy of Arts and Sciences, and in 1915 received the Order of the Rising Sun (Japan) third class. He has published 'Thermodynamics of the Steam Engine' (1889); 'Valve-gears' (1892); 'Naval Architecture' (1904); 'Thermodynamics of the Steam Turbine' (1911); 'Computations for Marine Engines' (1913).

PEABODY, Elizabeth Palmer, American writer and educator: b. Billerica, Mass., 16 May 1804; d. Jamaica Plain, Mass., 4 Jan. 1894. She engaged in teaching at 16 and later studied Greek under Emerson. She taught under Amos Bronson Alcott (q.v.), was for a time secretary to William Ellery Channing and subsequently was largely instrumental in introducing the Froebel kindergarten system into the United States. Among her publications, which are chiefly of an educational character, are 'First Steps in History' (1833); 'Crimes of the House of Austria' (1852); 'Kindergarten Culture' (1870); 'Kindergarten in Italy' (1872); 'Reminiscences of William Ellery Channing' (1880); 'Letters to Kindergartners' (1886); 'Education in the Home Kindergarten' (1887), etc.

PEABODY, Francis Greenwood, American Unitarian clergyman and educator: b. Boston, Mass., 1847. He was graduated from Harvard in 1869, from the Harvard Divinity School in 1872, and in 1874-80 was pastor of the First Parish Church at Cambridge, Mass. From 1880-86 he was professor of theology in the Harvard Divinity School, and from 1886-1912 was Plummer professor of Christian morals at Harvard University, retiring as emeritus professor in 1912. He has published 'Mornings in the College Chapel, First Series' (1896); 'Afternoons in the College Chapel' (1898); 'Jesus Christ and the Social Question' (1900); 'Religion of an Educated Man' (1903); 'Jesus Christ and the Christian Character' (1905); 'Mornings in the College Chapel, Second Series' (1907); 'Approach to the Social Question' (1909); 'Evenings in the College Chapel' (1911); 'Christian Life in the Modern World' (1914).

PEABODY, George, American merchant and philanthropist: b. Danvers (now Peabody), Mass., 18 Feb. 1795; d. London, England, 4 Nov. 1869. His parents were poor, and after a common school education he became clerk in a grocery store at the age of 11. In 1812 he went to Georgetown, D. C., as clerk in his uncle's grocery; but a few years later entered into partnership with Elisha Riggs in the wholesale dry goods business, at Baltimore. Largely through his untiring industry the firm became prosperous and influential, and his partner retiring in 1829, he was left at the head of the business. In behalf of his firm he had several times visited London, and decided to make that his permanent residence. He consequently severed his connection with his American firm, established in London a banking and mercantile business under the firm name of George Peabody and Company and amassed a large fortune. This wealth he devoted largely to promoting education, giving most generously to several institutions. He gave \$200,000 to found an institute with a free library and lecture course in his native town of Danvers; and to the city of Baltimore gave \$1,400,000 for an

institute combining free library and lectures with an academy of music and an art gallery. In 1866 this institute was opened and he was present at the dedication ceremonies. He further gave \$150,000 to Yale for a museum of natural history; the same amount to Harvard for a museum of archaeology and ethnology; \$140,000 to Salem, Mass., to found the Peabody Academy of Science; and an endowment of \$13,000 to the Newburyport public library. In 1862 he placed in the hands of trustees in the city of London \$750,000 for the building of model tenement-houses for the poor to be let at moderate rents. This plan proved so successful and the houses were so well patronized that he later increased the fund to \$2,500,000, it being known as the London Peabody fund. In 1851 he contributed \$15,000 for the improvement of the United States exhibit at the London World's Fair; and in 1852 gave \$10,000 to the second expedition under Dr. Kane in the search for Sir John Franklin. Hence a part of the region discovered by this expedition was named in his honor Peabody Land. His last and most important gift was that of \$3,500,000 for the promotion of education in the Southern States, under the control of a special board of trustees, and known as the Peabody Educational Fund (q.v.). The total amount of his gifts was between \$8,000,000 and \$9,000,000. His benefactions were so eminently wise and helpful to the community that he was greatly respected and beloved in both England and America. In 1866 he was given the freedom of the city of London, an unusual honor; and the queen sent him an autograph letter and a miniature portrait of herself, both of which are at the institute in Peabody, Mass. A public funeral was given him in Westminster Abbey; and his remains were brought to the United States by the British ship-of-war *Monarch*, and buried with fitting honors at Danvers, Mass. (See PEABODY COLLEGE FOR TEACHERS; PEABODY EDUCATIONAL FUND). Consult The 'Life by Hanford' (1870); Bolton, 'Poor Boys who became Famous' (1888); Curry, 'Brief Sketch of George Peabody' (1898).

PEABODY, George Foster, American banker: b. Columbus, Ga., 27 July 1852. He was educated in private schools and is president of the Broadway Realty Company, the Mexican Coal and Coke Company, the Compania Metalurgica Mejicana, and director in many other corporations. In 1896-1905 Mr. Peabody was treasurer of the Democratic National Committee. He is chairman of the State of New York Reservation Commission, director of the General Education Board, the Southern Education Board, the Hampton Normal and Agricultural Institute, the Tuskegee Normal and Industrial Institute, the University of Georgia, the Skidmore School of Arts, the New York Chamber of Commerce. In 1903 he received the honorary degree of A.M. from Harvard, that of LL.D. in the same year from Washington and Lee and in 1906 from the University of Georgia.

PEABODY, Henry Oliver, American inventor: b. Boxford, Mass., 13 May 1826; d. Point Allenton, Mass., 28 July 1903. At the outbreak of the Civil War he was employed in an arms factory in Boston, and there invented the breech-loading gun known as the Peabody

GEORGE PEABODY

rifle. It was manufactured in large quantities by a Providence establishment for the Turkish government. Its pattern was copied extensively in Europe, where it was not patented.

PEABODY, James Hamilton, American banker: b. Topsham, Vt., 21 Aug. 1852; d. 23 Nov. 1917. He was educated in the public schools and going to Colorado engaged in business first as a bookkeeper and then as a merchant in Cañon City. In 1885 when the First National Bank of Cañon City was organized he was chosen vice-president, and later became president. He was also active in public life, was city clerk, member of the school board, city treasurer and member of the city council; in 1885 he was elected county clerk on the Republican ticket. In 1902 he was nominated and elected governor of Colorado for a two years' term. He was a prominent member of the Masonic fraternity.

PEABODY, Josephine Preston, American poet: b. New York, 1874. She was educated at Radcliffe College and was instructor in English literature at Wellesley College, 1901-03. In 1906 she married Prof. L. S. Marks of Harvard University. In 1909 her drama 'The Piper' won the Stratford-on-Avon prize. This drama was presented throughout New England the following year and in New York in 1911. She is a contributor, especially of poetry, to leading magazines. (See *THE PIPER*). She is the author of 'Old Greek Folk Stories' (1897); 'The Wayfarers: a Book of Verse' (1898); 'Fortune and Men's Eyes: New Poems with a Play' (1900); 'Marlowe,' a drama infused with the Elizabethan spirit, and containing several beautiful lyrics (1901); 'The Singing Leaves' (1903); 'The Wings' (1905, a drama); 'The Book of the Little Past' (1908); 'The Singing Man' (poems, 1911); 'The Wolf of Gubbio' (drama, 1913); 'New Poems' (1915).

PEABODY, Robert Swain, American architect: b. New Bedford, Mass., 22 Feb. 1845; d. 23 Sept. 1917. In 1866 he was graduated at Harvard University, and subsequently studied at the École des Beaux-Arts, Paris. He established his practice in Boston in 1870 and from 1909 until his death was chairman of the Boston park commission. His principal works are the Boston Chamber of Commerce, the city hall of Worcester, Mass., the Chamber of Commerce of Cleveland, Ohio, and Machinery Hall at the Columbian Exposition at Chicago in 1893. For many years Mr. Peabody was an overseer of Harvard and in 1900-01 was president of the American Institute of Architects and in 1902-05 and 1907-09 of the Boston Society of Architects. In 1910 he was made an associate of the National Academy of Design. He published 'A Holiday Study of Cities and Ports' (1908) and 'An Architect's Sketch Book' (1912).

PEABODY, Selim Hobart, American educator: b. Rockingham, Vt., 20 Aug. 1829; d. Saint Louis, Mo., 27 May 1903. He was graduated from the University of Vermont in 1852, appointed professor of mathematics and engineering at the Polytechnic College at Philadelphia, Pa., where he remained from 1854-57 and was later connected with various educational institutions in the West. He was professor of physics and engineering at the Massachusetts

Agricultural College in 1871 and in 1878 accepted the chair of mechanical engineering at the Illinois Industrial Academy at Champaign, Ill. He was elected president of that institution in 1880 and under his administration it became the University of Illinois. He resigned the presidency in 1891 to become chief of the department of liberal arts at the World's Columbian Exposition. Among his publications are 'Astronomy' (1869); 'Juvenile Natural History' (3 vols., 1869); 'New Practical Arithmetic' (1872); 'American Patriotism' (1880); 'Charts of Arithmetic' (1900).

PEABODY, Mass., town, the world's largest sheepskin town, Essex County, on the Boston and Maine Railroad, two miles west of Salem. It includes the villages of Peabody, North Peabody, South Peabody and West Peabody. The town was incorporated in 1855 as South Danvers, and, in 1868, the name was changed in honor of George Peabody (q.v.), who was born there. The most important of its manufactures is leather, plain and morocco; others are shoes, electrical supplies, tanning machinery, hair goods and glue. It contains the Peabody Institute, founded in 1852 by George Peabody, and the Eben Dale Sutton Reference Library. The institute is under the management of a board of trustees who report annually to the town government; it contains a library of 47,600 volumes (1916) and a lecture hall in which free lectures are given. The Sutton Library is under the control of the same trustees. In 1902 the Peabody Historical Society presented the institute with a small safe containing pictures of the town, articles by leading citizens and newspapers, which is "to be opened by the citizens of Peabody on or after 16 June 2002." Pop. (1920) 19,552.

PEABODY-BIRD, the white-throated sparrow (q.v.), so called in northern New England.

PEABODY COLLEGE FOR TEACHERS. In 1867 George Peabody made his memorable donation to the cause of Southern education, giving first and last over \$2,000,000 to a distinguished body of gentlemen from various Northern States as well as from the South. These gentlemen organized themselves under the title "The Trustees of the Peabody Education Fund." Peabody Normal College was established as the first central work of the Peabody Education Fund at Nashville, Tenn., in 1875. The institution grew steadily and received increased appropriations from the State of Tennessee as well as from the Peabody Education Fund, using the grounds, buildings and equipment of the University of Nashville by courtesy of that institution. From the outset Peabody College was designed for the higher training of teachers and to encourage State support for normal schools and for the development of public education. It has remained true to that mission, changing and advancing its curriculum as adapted to the larger aims in Southern education as related to the entire nation. As Peabody College grew in number of students and in influence, it became necessary to secure a permanent endowment and a more stable policy. From 1905 to 1909 these plans were worked on energetically and with success. For 30 years the college had run

successfully without a charter of its own and with no income except annual appropriations. In 1909 the institution was duly incorporated on 30 September under the title "George Peabody College for Teachers." Its new board of trustees held their first meeting on 5 October of that year. George Peabody College for Teachers now received an endowment of about \$1,750,000. In 1911 plans for new buildings on a new campus were begun, and from that date to 1914 a successful campaign for additional funds was prosecuted, resulting in bringing to the college \$1,500,000 of new endowment. The college now owns a very attractive campus of 50 acres adjacent to the campus of Vanderbilt University on the one side and the campus of Ward-Belmont College on the other, forming a group of about 125 acres of almost continuous campus in the best residential section of Nashville. Good physical surroundings of the college are, therefore, secured for all time. On the campus there are now five buildings of new fire-proof construction, designed in classical style, with special reference to Southern colonial architecture. These five buildings have been erected at a cost of over \$1,000,000. The total resources of the college are now nearly \$3,750,000. The college has been organized on the quarter plan since 1908, following in the main the system which has been so successful at the University of Chicago. With Vanderbilt University there is a contractual arrangement by which students in either institution may choose as much as one-third of their studies in the other institution. This makes it possible for each institution to put all of its resources and energy into special departments without duplication. Thus there is created in resources and strength virtually a single institution backed by something like \$8,000,000. Scholarships bestowed by the Peabody Fund are given to a certain number of worthy students of the college. The degree of licentiate of instruction is conferred by the college, and the student holding this degree is by law eligible, without any further examination, for any teaching position in the public schools of Tennessee. The university confers other degrees: master and bachelor of arts, letters and science. George Peabody College for Teachers has its alumni and former students in almost every kind of educational position throughout the South and the United States and foreign countries. Over 15,000 students have attended the institution and at least 3,000 graduates have received diplomas from its faculty. At present the summer quarter is very popular with progressive teachers in active service, who come for six weeks or 12 weeks and receive instruction which they take back to their important positions throughout the entire South. The summer quarter has usually about 1,500 students. There are about 500 students in the fall, winter and spring quarters.

CHARLES E. LITTLE.

PEABODY EDUCATION FUND, founded in 1867 by George Peabody (q.v.) for educational purposes in the South. In the articles of endowment the words are that the money shall be used for promoting "intellectual, moral and industrial education in the most destitute portion of the Southern States." The first gift was securities amounting to \$2,100,000 of

which \$1,000,000 were Mississippi State bonds. The Mississippi bonds were afterward repudiated. Mr. Peabody gave \$1,000,000 additional in 1869. Of this amount \$384,000 were Florida bonds, issued while that section was a Territory, and for certain reasons such bonds had never been recognized as legal by the State. The fund was placed in charge of 15 trustees, men prominent in the United States—Robert C. Winthrop of Massachusetts was chairman.

The trustees held meetings annually, generally in New York City. They filled vacancies caused by death or resignation and transacted such business as was necessary. The trustees had authority to spend the interest and 40 per cent of the principal the first two years; after that time the principal was to remain intact for 30 years, when the whole amount might be divided and distributed for educational purposes, as might be deemed best by the trustees. The rules governing the use of the fund were broad and precautions were taken not to interfere with established schools. Efforts were to be made to work with existing schools, to strengthen weak schools and to promote in general elementary education. No school should receive aid unless it had in attendance at least 100 students and maintained a school 10 months in the year. The district desiring a share of the fund should contribute twice the amount granted by the trustees. A school having an attendance of 100 pupils and complying with other conditions, might have \$300; if 200 pupils were in attendance, it might have \$600; and a school with 300 in attendance might have \$1,000. Normal and training schools for teachers received special attention. Scholarships were granted to many worthy pupils—at first \$200 each, later \$100. From the establishment of the fund to the end of the 30 years the total amount paid out was about \$2,600,000. The greater part of this sum was used in Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Texas, Tennessee, Virginia and West Virginia. The policy of the trustees of the fund and their agents became a most powerful influence in developing public education, universal and genuinely democratic, and made a marked impression on every type of school in the South, its chief instrument being the Peabody College for Teachers (q.v.). Consult Little, C. E., "George Peabody College for Teachers: Its Evolution and Present Status" (Nashville 1912); Reports of United States Commissioner of Education, in which will be found an account of the foundation and distribution of the fund.

PEACE (*in law*). See BREACH.

PEACE, Breach of. See BREACH.

PEACE, Religious (German, *Religions-friede*), a series of treaties by which, after the Reformation, the Protestant states were granted their religious liberty. There are two treaties which especially bear this name, that of Nuremberg, signed by the Protestants on 23 July and confirmed by the emperor, Charles V, at Ratisbon, 2 Aug. 1532, and that of Augsburg, 26 Sept. 1555. By the treaty of Nuremberg the emperor pledged himself to summon a council to settle all religious differences, and both sides agreed to suspend hostilities until the council should be convoked. The Protestants gained

by this peace only a temporary security. The Peace of Nuremberg was renewed six times between 1534 and 1545. The victory of Charles over the Schmalkaldic League placed the whole of Germany at his mercy, when the declaration of war by the Elector Maurice compelled him to accept the Peace of Passau, 31 July 1552, by which the right of the evangelical states to the free exercise of their religion was acknowledged by the emperor, who promised to convene a diet to settle the rights of the two religious parties and the rights of the imperial authorities. Several circumstances delayed the meeting of the diet, which took place at Augsburg in 1555, presided over by the Archduke Ferdinand, and concluded the treaty known as the Religious Peace of Augsburg, which provided that no state was to be disturbed on account of its religion. Subjects were not forbidden to leave a state where their religion was persecuted, and the Protestants were to retain all the ecclesiastical benefices in their possession after the Peace of Passau. The Calvinists were not included in the provisions of this treaty, but by the Peace of Westphalia (1648), which placed the Calvinists on the same footing with the Lutherans, a permanent peace was established.

PEACE CONFERENCES. See HAGUE COURT; PEACE TREATIES; WAR, EUROPEAN — PEACE CONFERENCE.

PEACE CONVENTION, in American history, a term used at the beginning of the Civil War. After the secession of several of the Southern States, Virginia on 1 Jan. 1861 invited the other secession States to send delegates to a conference in Washington, D. C., with the object of devising a plan whereby all differences between the North and the South might be peaceably settled. The conference met 4 February and delegates were present from 14 free States and seven slave States. Ex-President John Tyler was made presiding officer. A committee of one from each State was appointed to draw up a report of "what they may deem right, necessary, and proper, to restore harmony and preserve the Union." Several minority reports were presented, but the majority report was adopted. It recommended a number of amendments to the Constitution, the substance of which was as follows: (1) In the Territories north of lat. 36° 30' slavery was to be prohibited. In Territories south of that line the institution was to remain as it then was, and no law was to be passed abridging the right of a man to take his slave thither. The status of new States was to be determined by the constitution adopted by them. (2) No new territory was to be acquired except by discovery or for naval and commercial stations or depots, without the concurrence of a majority of the senators from the free States and a majority of the senators from the slave States. (3) Neither the Constitution nor any amendment thereof was to be construed as giving Congress power to interfere with slavery in any State; nor to abolish it in the District of Columbia without the consent of the State of Maryland and of the owners, nor without compensation to the latter; nor to prohibit representatives and others from taking their slaves to the District and bringing them away again; nor to prohibit slavery in any place under the jurisdiction of the United States, if within a slave State; nor

to prohibit the inland slave trade between slave States, but not in or through free States. The slave trade in the District was prohibited. Section 4 provided for the delivery of fugitive slaves, section 5 for the prohibition of the foreign slave trade, section 7 for the payment to owners by the United States of the value of slaves that might escape by reason of the interference of mobs with Federal officers, and for "securing to the citizens of each State the privileges and immunities of citizens in the several States," while section 6 ordained that sections 1, 3 and 5 and article 1, section 2, clause 3, and article 4, section 2, clause 3 of the Constitution were to be amended or abolished only by the unanimous consent of the States. This report was offered to the Senate, which refused to act upon it, and it met a similar fate in the House, neither party being satisfied with it.

PEACE OF GOD, a cessation from private warfare which the Roman Catholic Church in France in the 10th and 11th centuries tried to impose upon the nobles of that country. The ecclesiastical authorities in several synods recommended that all differences should be settled by the ordinary civil tribunals, and attempted to enforce obedience or at least compliance by threats of spiritual penalties. But these efforts were all in vain, the nobles refusing to submit to any of the minor courts — the only ones then existing. A compromise was arrived at which resulted in the establishment of what was known as the Truce of God (q.v.).

PEACE OF THE PYRENEES. See PYRENEES, PEACE OF THE.

PEACE RIVER, Canada, an important affluent of the Mackenzie (q.v.).

PEACE SOCIETY, an organization founded for the purpose of promoting universal peace on a permanent basis among the nations. William Allen and Joseph Price organized a peace society in London in 1816; but the first peace society on the European continent was established in Geneva in 1830. At the International Peace Congress held in London in 1843 there were present 294 British, 37 American and six Continental delegates. The society, more or less a religious movement, asked the support of all denominations as well as of persons who oppose war on any grounds. It has always advocated a gradual disarmament by all the nations of Europe, but its main contention is the necessity for adopting the principle of arbitration in international disputes. See AMERICAN PEACE SOCIETY; CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE; PEACE CONVENTION.

PEACE TREATIES. Although comparatively few peace treaties were negotiated prior to the Middle Ages, the making of such agreements, as well as the observance of treaties in general between the great nations of the world, was one of the first phenomena to indicate the advance of civilization. In the history of international law there were few subjects that received earlier attention. The Greek and Roman historians devote much space to the subject, while the fact that nations had given thought to this method of settling grievances ages before these chronicles were written is indicated by the references to such agreements which appear in the Old Testament writings as

well as by the records discovered upon the ancient monuments of Egypt and Assyria. Even the movement for universal arbitration, the principle which attained its culmination in The Hague tribunal, is almost as old as the records of history. It is true that the first instances of arbitration, especially those of Greece, were intermunicipal, rather than between the different races. During the Middle ages the popes were frequently appealed to, and it was in response to such demands that Innocent III became the mediator between King John and his barons; Boniface VIII arbitrated the difficulties between Edward I and Philippe le Bel; Leo X arranged affairs for Maximilian and the Doge of Venice, just as, in more modern times, Leo XIII adjusted the dispute of Germany and Spain in relation to the Caroline Islands. It was as early as 1603 that Sully suggested his plan for a "Concert" of the 15 states, by which all international differences were to be decided. A century later the Abbé Saint Pierre proposed the organization of his "General League of Christendom," but, although his international peace court was based upon a less ulterior motive than that of Sully, it had little effect except to inspire a hundred or more similar schemes which helped to prepare the world for the organization of the 19th century tribunal of arbitration at The Hague.

The most important treaty to which the United States has been a party was the Peace of Paris, the preliminaries of which were signed in that city 13 Nov. 1782. In announcing the settlement of these preliminaries John Adams wrote: "We have been very industrious, having been at it forenoon, afternoon, and evening, ever since my arrival," while Benjamin Franklin, who was also a member of the commission, added: "We hope the terms we have secured will be satisfactory, though to secure our main points we may have yielded too much in favor of the royalists."

Despite the fact that the treaty was so favorable to his interests, George III did not see fit to ratify it until 6 Aug. 1783. On the 3rd of the next September the definite treaty of peace, which formally acknowledged the existence of the new republic as a nation, was signed, also at Paris, and 14 July 1784 it was duly confirmed by Congress.

The following list includes the most important peace treaties negotiated by the various nations of the world:

AARAU.—At the conclusion of the religious war in Switzerland, which ended in a victory for the Protestants, 25 July 1712, the Treaty of Aarau was signed, 15 Aug. 1712. By its provisions the two religions were equalized throughout the Swiss provinces.

ABO.—A treaty signed by Russia and Sweden, 18 Aug. 1743. By its provisions Russia acquired the southern territory of Finland as far as the river Kymen, and the privilege of electing an ally as prince royal of Sweden.

ADRIANOPLE.—This important treaty between Russia and Turkey was signed at Adrianople, 14 Sept. 1829. By its provisions Turkey not only recognized the independence of Greece, but gave to Russia nearly all the rights she demanded, including the control of a part of the left bank of the lower Danube, as well as the Sulina mouth of that river; several districts on the northeastern coast of the Black Sea, with their important fortresses; the confirmation of the protectorate of the Tsar over the Danubian principalities, and the confirmation to Russian subjects of the rights of trade in Turkey, and the freedom of navigation in the Black Sea, the Danube and the Dardenelles. See **ADRIANOPLE**.

AIX-LA-CHAPELLE.—The first peace Treaty of Aix-la-Chapelle was signed 2 May 1668, when France, in accordance

with the demands of the Triple Alliance (then composed of England, the Netherlands and Sweden), returned France-Comte to Spain in consideration of the cession of 12 fortified towns on the border of Spanish Netherlands. The second peace Treaty of Aix-la-Chapelle put an end to the famous war of the Austrian Succession. It was signed 18 Oct. 1748, and provided for the mutual restitution of conquests, except in the case of Austria, which was compelled to cede Parma, Guastalla and Piacenza to Don Philip of Spain, and to confirm the rights that Prussia had acquired in Silesia. See **AIX-LA-CHAPELLE, TREATIES OF PEACE**.

ALAIS.—The last of the religious wars in France was ended by the peace Treaty of Alais, which was signed in 1629. By its provisions the Huguenots ceased to exist as a political party.

ALKMAAR.—It was in accordance with the provisions of the Convention of Alkmaar, signed October, 1799, that the Anglo-Russian forces under the command of the Duke of York evacuated the Netherlands.

ALTSTADT.—The treaty of peace, dictated by Charles XII of Sweden, and which cost Augustus II of Saxony his possession of Poland, was signed 24 Sept. 1706.

AMERICA.—See **PARIS**, in this article.

AMIENS.—The Peace of Amiens was concluded 27 March 1802. By the provisions of the treaty, which was between Great Britain on one side and France, the Batavian Republic and Spain on the other, the former agreed to recognize the Ionian Republic and to restore all conquests with the exception of Ceylon and Trinidad, on condition that France should abandon Rome and Naples and should restore Malta to the Knights of Saint John.

ANCON.—A treaty by the provisions of which Peru ceded important territories to Chile, was signed 20 Oct. 1883.

ANTALCIDAS.—This treaty, which was signed by Antalcidas the Lacedæmonian with Artaxerxes, king of Persia, in 387 B.C., was made on behalf of Greece and in favor of Sparta. By its provisions the cities of Ionia passed to the Persians.

ANTANARIVO.—This treaty, signed 1 Oct. 1895, marked the conclusion of the troubles between France and the Hovas. By its provisions the French protectorate over Madagascar was established.

ANTONY AND OCTAVIUS.—In B.C. 40, Antony and Octavius were compelled by their own soldiers to make a treaty of peace. It was signed at Brundisium, and was the means of postponing for fully 10 years the final struggle between the two chief triumvirs.

AUGSBURG.—While, in one sense of the word, a religious peace treaty, the agreement which was concluded between the Lutheran and Catholic state of Germany at Augsburg, 25 Sept. 1555, exerted an important political influence at that time. By the provisions of the treaty each state was permitted to prescribe the form of worship to be followed within its limits. This triumph of the Reformation, however, did not extend so far as to include the Calvinists.

BADEN.—A treaty signed by the German Empire and France, 7 Sept. 1714. This, with the treaties of Utrecht and Rastadt, concluded that war of the Spanish Succession. By its provisions the Peace of Ryswick (q.v.) was ratified; the electors of Bavaria and Cologne were fully reinstated, and Landau was ceded to France.

BASEL.—5 April and 22 July 1795. See **BASEL, TREATIES OF PEACE AT**.

BELGRADE.—By this treaty signed between Turkey, Austria and Russia in September, 1739, Russia returned to Turkey her conquests in Moldavia and Bessarabia, and relinquished her naval rights in the Black Sea, while Austria renounced her territory in Wallachia, Bosnia and Serbia. See **BELGRADE**.

BERGERAC.—A treaty of peace, establishing liberty of conscience, was signed between the Catholics and Protestants at Bergerac, France, 17 Sept. 1577.

BERLIN.—Treaty of 1742. See **BRESLAU**, in this article.

BERLIN.—On 21 Oct. 1866, Saxony signed a treaty of peace with Prussia by the provisions of which she agreed to pay 10,000,000 thalers as indemnity to Prussia for the part her forces had played in the struggle known as the Seven Weeks War.

BIAC-NA-BATO.—This treaty was signed by Aguinaldo, as leader of the Philippine insurgents, and Spain, 14 Dec. 1897. By its provisions he agreed that the insurgents would evacuate all positions and would maintain a three years' armistice in return for a stated cash consideration. The latter condition was never fulfilled.

BORDEAUX.—A treaty of peace signed by Bouillon and his allies and Mazarine, after the siege of Bordeaux, in July 1650.

BREDA.—By the Treaty of Breda, signed between England, Holland, France and Denmark, 31 July 1667, the rights of England in New York and New Jersey, of France in Arcadia, and of Holland in Surinam, were confirmed by the Powers.

BRESLAU.—The treaty signed at Berlin by Lord Hyndford, as representative of Maria Theresa, queen of Hungary, with Podewitz, Minister of Prussia, 28 July 1742, is known as the Peace of Breslau, owing to the fact that the preliminary convention was signed at that place on 11 June.

By the provisions of this treaty Silesia was ceded to Prussia by Austria.

BREST-LITOVSK.—A treaty of peace between Germany, Austria-Hungary, Bulgaria and Turkey on the one part and "The Ukrainian People's Republic" on the other part; signed 9 Feb. 1918.

BREST-LITOVSK.—A treaty of peace between Germany, Austria-Hungary, Bulgaria and Turkey of the one part and Russia through the Bolshevik government of the other part, signed 4 March 1918. It was almost immediately renounced by several sections of the Russian people.

BRETIGNY.—This treaty known as "The Great Peace," was signed by Edward III of England and John II of France, 8 May 1360. See **BRETIGNY**.

BROMSEBRO.—By the provisions of the treaty of peace signed at Bromsebro, between Sweden and Denmark, in August 1645, the latter nation renounced its rights to rule over Jemtland, the island of Gothland, etc.

BUCHAREST.—This treaty, concluded 8 May 1812, ended the war which had been waged between Russia and Turkey since 1806. By its provisions the Pruth and the Lower Danube became the established boundary between these countries. See **BUCHAREST, PEACE OF**.

BUCHAREST.—The treaty of peace concluding the Second Balkan War, signed 10 Aug. 1913, by Rumania, Greece, Montenegro, Serbia and Bulgaria, defining the boundaries of Bulgaria and formally recording the latter's renunciation of all claims in the Isle of Crete.

BUCHAREST.—A peace treaty between Germany, Austria-Hungary, Bulgaria and Turkey on the one hand and Rumania on the other, signed 6 May 1918.

CALLIAS.—A treaty concluded at Sparta, June 371 B. C., in which Athens and Sparta and all their allies participated. Callias, from whose name the treaty derived its title, was one of the most prominent Athenian envoys.

CAMBRAI.—A treaty signed between Francis I of France and Charles V, 5 Aug. 1559, by which France not only permitted Italy to revert to the emperor, but also relinquished all claims over Artois and Flanders, her rights to the duchy of Burgundy alone being recognized. This treaty is sometimes called the "Ladies' Peace," because of the fact that the preliminary negotiations were undertaken by Louise, the mother of Francis, and Margaret, aunt of Charles.

CAMPO-FORMIO.—A treaty provided that Austria should cede the Belgian provinces and recognize the Cisalpine Republic, retaining, on the other hand, a large proportion of the Venetian territories, while France retained the Ionian Islands.

CARLOWITZ.—The Peace of Carlowitz will always be known as one of the most memorable treaties in history: (1) because of the magnitude of the territorial changes involved; (2) because it marked the beginning of the downfall of the Ottoman Empire as an aggressive power, and (3) because by taking part in a General Congress for the first time the sultan admitted the principle of intervention of the Powers for the general good. This treaty, which was for 25 years, was concluded 26 Jan. 1699, between Russia, Austria, Poland, Venice, and Turkey, by the mediation of England and the Netherlands. By its provisions Austria received that portion of Hungary lying between the Danube and Theiss, as well as Transylvania; Russia obtained Azoff; Venice retained the Morea, while Poland regained Podolia and Ukraine.

CATEAU-CAMBRESIS.—A treaty between England, France and Spain, signed 3 April 1559, by which the two latter countries restored many of their conquests.

CHERASCO.—This treaty, signed 6 April 1631, confirmed the Treaty of Ratisbon which had been concluded between Richelieu and Ferdinand II, thus ending the War of the Mantuan Succession.

CHINA AND JAPAN.—The Treaty signed between China and Japan, 16 April 1895, not only compelled China to pay a heavy indemnity, but required the cession of Formosa, the recognition of the independence of Korea and other concessions.

CIMON.—The Peace of Callias (q.v.) is sometimes known as the Peace of Cimon.

CLAIR-ON-EPTE.—A treaty signed about A.D. 911, between King Charles, Duke Robert of Paris and Rolf. By its provisions a definite district was ceded to Rolf, upon condition that he would become the king's vassal. After having been admitted to baptism the king's natural daughter was given him in marriage.

CONFLANS.—It was this treaty, signed in October, 1465 between Louis XI of France and the dukes of Burgundy, Bourbon and Brittany, which marked the conclusion of the War of the Public Good. By its provisions Normandy was ceded to the Duke of Berry.

CONSTANCE.—The peace treaty concluded by Frederick Barbarossa and the Lombard League in 1183, by which the cities of the League acknowledged the overlordship of the emperor upon his renouncement of the regalian rights which he had previously claimed.

CONSTANTINOPLE.—See **PRUTH 1711**, in this article.

CONSTANTINOPLE.—By this treaty signed between Russia and Turkey, 8 Feb. 1879, the provisions of the Treaty

of San Stefano (q.v.) were materially modified, and the sultan was compelled to pay a heavy war indemnity.

CONSTANTINOPLE.—The treaty of peace, signed between Turkey and Greece in December, 1897, officially concluded the Greek War.

CREPY-EN-LAONNAIS.—By this treaty, signed between Francis I of France and Charles V, the emperor renounced all claims to Burgundy, while Francis renounced all rights in Lombardy, Naples, Flanders and Artois.

DENNIKON.—The peace treaty that was signed at Dennikon in 1531 established the principle of each canton's independence.

DRESDEN.—The Peace of Dresden concluded the second Silesian War. It was signed between Austria, Saxony and Prussia, 25 Dec. 1745, and its provisions confirmed Frederick the Great in his contention for the possession of Silesia.

DYRRACHIUM.—The first Macedonian War, which began in 214 B.C. was concluded by the Peace of Dyrrachium signed 205 B.C. This peace was of five years' duration.

EL ZANJON.—Peace was declared between the Spanish forces and the Cuban revolutionists in 1878, when the Treaty of El Zanjon was signed. According to the provisions of the treaty General Gomez disbanded his army and retired to San Domingo, but the reforms which Spain had promised in return never materialized. As the result the standard of revolt was once more raised in 1895.

EVORA MONTE.—The treaty of Evora Monte concluded the attempt of Dom Miguel to capture the throne of Portugal. By its provisions he abandoned his claim to the crown in consideration of a pension of \$60,000 per annum.

FALAISE.—The engagement of fealty to Henry II taken by William the Lion, king of Scotland, in 1175, is generally known as the Treaty of Falaise.

FLEIX.—This treaty of peace which was concluded between Henry III of France and the Huguenots, 26 Nov. 1580, was little more than a renewal of the Treaty of Bergerac (q.v.).

FOLIGNO.—By the truce of Foligno, concluded between Napoleon and the King of Naples, February, 1801, the latter ceded part of the island of Elba and abandoned all rights in Tuscany.

FOMMANAH.—A treaty of perpetual peace was concluded between Great Britain and the Ashantees, 13 Feb. 1874. By its provisions an indemnity of 50,000 ounces of gold was paid, supremacy over Adansi and other tribes was renounced, free trade was guaranteed and human sacrifices were abandoned.

FONTAINEBLEAU.—The preliminary convention of peace between Great Britain, France, Spain and Portugal, was signed at Fontainebleau, in 1762.

FONTAINEBLEAU.—The peace between the emperor and the Dutch was concluded 8 Nov. 1785. By its provisions the emperor, in lieu of 10,000,000 guilders, renounced his claims to the free navigation of the Schelde outside of his own domain, and all pretensions to Maesricht, etc.

FRIBURG.—A perpetual peace was negotiated between France and the Swiss cantons at Friburg, 29 Nov. 1516.

FUESSEN.—By this peace treaty, concluded between Queen Maria Theresa of Hungary, and the Elector of Bavaria, 22 April 1745, the latter renounced all claim to the imperial crown in return for his lost territories.

GHEENT.—The treaty of peace between the United States and Great Britain, which concluded the War of 1812, was signed at Ghent, 24 Dec. 1814. Its provisions included the mutual restitution of conquered territory, and the appointment of a commission to settle the boundary dispute, and matters relating to islands in Passamaquoddy Bay. See **GHEENT, TREATY OF**.

GREENVILLE.—The peace concluded between "Mad Anthony" Wayne and the Northwestern Indians, 3 Aug. 1795. The treaty, which made cession of an extensive territory to the Union, also guaranteed the safety of all settlers. See **GREENVILLE, TREATY OF**.

GUADALUPE-HIDALGO.—The treaty of peace which concluded the war between the United States and Mexico was signed 2 Feb. 1848. It fixed the boundary line between the two republics, and, by its provisions, the United States paid to Mexico \$15,000,000 for the territory which it gained by the new boundary, and also relieved Mexico from all claims of citizens of the United States for damage, agreeing to pay the same to the amount of \$3,250,000. See **GUADALUPE-HIDALGO, TREATY OF**.

GUERANDE.—The civil war which established Montfort as Duke of Brittany was concluded by the Peace of Guernsey, signed in 1365.

GUINES.—The war between Henry VIII and Francis I of France was terminated by the Treaty of Guines, signed in 1547. By its provisions Boulogne, which had been taken by the English, was restored to the French upon receipt of an indemnity of 2,000,000 gold crowns.

HAGUE.—The treaty of peace between Spain, Savoy and Austria was concluded at The Hague, 17 Feb. 1717.

HAMBURG.—The Treaty of Hamburg was concluded between Russia and Prussia, 5 May 1762.

HODEIBA.—The truce of Hodeiba was extorted from the Koreish by Mahomet in 628. As the result of its provisions hostilities were suspended for 10 years.

HUBERTSBURG.—The Peace of Hubertsburg, which terminated the Seven Years' War, was signed by Prussia, Austria and Saxony at the castle of Hubertsburg, 15 Feb. 1763. By its provisions Prussia retained Silesia.

JASSY.—The Treaty of Jassy, concluded between Russia and Turkey, in 1792, extended the Russian borders to Dniester and gave to her the coast on which the city of Odessa soon arose.

KAINARDJI.—See KUTSCHUK KAINARDJI, in this article.

KARLOWITZ.—See CARLOWITZ, in this article.

KIEL.—By the treaty of peace signed at Kiel, 14 Jan. 1814, Denmark ceded Helgoland to Great Britain and Norway to Sweden, receiving Swedish Pomerania and Rugen as exchange from the latter.

KIMON.—See CALLIAS and CIMON, in this article.

KUTAYAH.—By the treaty of peace signed here in May 1833, Turkey ceded Syria and the province of Adana to Ibrahim Pasha.

KUTSCHUK KAINARDJI.—By this treaty of peace signed between Russia and Turkey, 21 July 1774, the sultan renounced his sovereignty over the Tartars in southern Russia and granted other territories and strategical points in the Crimea and on the Black Sea.

LADIES' PEACE.—See CAMBRAY, in this article.

LA ROCHELLE.—The treaty by which Charles IX granted partial toleration to the Protestants, 6 July 1573, is known as the Peace of La Rochelle.

LAUSANNE.—The treaty of peace signed by Italy and Turkey, 8 Oct. 1912, by which Tripolitana and Cyrenaica were ceded to Italy.

LEOBEN.—A provisional treaty of peace concluded between Napoleon I and the Austrians, 18 April 1797. By secret provisions Napoleon promised to exchange the greater part of the mainland territory of Venice for the Netherlands. Its terms were modified by the Treaty of Campo-Formio (q.v.).

LISBON.—The successful revolution of Portugal against Spain was officially terminated by the conclusion of the Treaty of Lisbon, 13 Feb. 1668. Although this treaty recognized the independence of Portugal, it provided for the cession of Ceuta to Spain.

LODI.—The war of Milan and Florence with Venice, Naples and other states ended with the signing of the treaty of peace at Lodi, 9 April 1454.

LONDON.—The treaty of peace closing the First Balkan War, signed 17-30 May 1913 by Greece, Bulgaria, Montenegro and Serbia, of the first part, and Turkey, of the second part. By this treaty Turkey ceded a large part of its territory in Europe, and the Isle of Crete, and confided to the monarchs of the neutral governments of Europe the disposition of the remainder of the Ottoman islands in the Ægean Sea, and the Peninsula of Mount Athos.

LONGJUMEAU.—A treaty of peace between the Catholics and Protestants was signed at this town in France, 23 March 1568. Peace was of brief duration, however, as war was under way again within six months.

LUBECK.—A peace signed between Wallenstein, for Germany, and the Danes, January 1629. In accordance with its provisions the Danes recovered all their former possessions, without the payment of indemnity. They were merely compelled to pledge themselves never again to interfere with the affairs of the empire.

LUND.—The treaty between Denmark and Sweden, adjusting the difficulties that had led them to participate in the War of 1672 between France and Holland was negotiated at Lund, 26 Sept. 1679.

LUNEVILLE.—Historians have always held that the Peace of Luneville was especially distinguished in that it marked the beginning of the end of the Holy Roman Empire. It was a treaty concluded between the emperor and the French, 9 Feb. 1801. By its provisions the Batavian, Cisalpine, Helvetic and Ligurian republics were recognized; the left bank of the Rhine was bestowed upon France; Tuscany was ceded to Parma, and the arrangements made with Austria by the Treaty of Campo-Formio were confirmed.

MANGALORE.—The treaty of peace by which the British and Tippu Saib agreed to a restitution of conquests was signed at Mangalore, India, in 1784.

MERSEN-RASTADT.—See RASTAIT, in this article.

MILAN.—The treaty of peace between Austria and Sardinia was concluded at Milan, 6 Aug. 1849.

MONSIEUR.—The treaty forced upon Henry III of France by a powerful combination of Huguenots and "Monsieur," the Duc d'Alençon, and whereby great concessions were made to the Huguenots, has since been known as the Peace of Monsieur. It was signed in 1576.

MONTPELLIER.—A treaty of peace which was extremely unfavorable to the Huguenots was signed at the close of the siege of Montpellier, in 1622.

MONTPELLIER.—The second Treaty of Montpellier, which offered more tolerable terms to the reformers, was signed in 1626.

MONZON.—A treaty of peace between France and Spain was signed at Monzon in May, 1626. The negotiations were conducted so quietly that the interested parties (Savoy, the Grisons, the Venetians, etc.) knew nothing about the matter until their fate had been settled by the treacherous cardinal, Richelieu.

MUNSTER.—The general peace which ended the Thirty Years' War was signed at Munster, 24 Oct. 1648. See also WESTPHALIA, in this article.

NANKING.—Great Britain and China concluded a treaty of peace which terminated the so-called "Opium war," in 1842. By its provisions China was not only compelled to pay an indemnity, but was forced to cede Hongkong to Great Britain, and to open the ports of Canton, Amoy, Fuchow, Nampo and Shanghai to British commerce.

NANTES.—The Edict of Nantes, issued by Henry IV of France, 13 April 1598, is also known as the Peace of Nantes, owing to the fact, that it put an end to the religious wars in France. See EDICT OF NANTES.

NAUPACTUS.—The conflict known as the "Social War" waged between the Achaean League, in alliance with Philip of Macedonia, and the Aetolian League, in combination with Sparta, was terminated by the Peace of Naupactus, B.C. 217.

NICE.—A truce famous in history was concluded at Nice between Charles V and Francis I of France, in 1538.

NICIAS.—The famous truce negotiated by Nicias during the Peloponnesian War, between the Athenians and Sparta, B.C. 421, has since been known as the Peace of Nicias.

NIKOLSBURG.—The preliminary peace terms, which were afterward confirmed by the Peace of Prague (q.v.), were negotiated at Nikolsburg, a town in Moravia, 26 July 1866. These terms acted as a truce in the war between Prussia and Austria.

NIMEGUEN.—See NIMWEGEN, in this article.

NIMWEGEN.—A number of treaties were concluded at Nimwegen, Netherlands, during 1678 and 1679. With subsequent treaties, including that of Westminster (1674); Fontainebleau (1679); Lund (1679); Saint Germain-en-Laye (1679), etc., they succeeded in terminating the war between France and Holland, and their allies, which had been in progress since the attack of Louis XIV upon Holland, in 1672. The treaties signed at Nimwegen were as follows: Between France and Holland, 10 Aug. 1678; between France and Spain, 17 Sept. 1678; between the emperor and France and Sweden, 5 Feb. 1679; between Holland and Sweden, 12 Oct. 1679. By the provisions of the treaty all territories taken were restored to Holland upon her pledge of future neutrality; France and Spain exchanged some extensive territories; the emperor ceded Friedberg-in-Breisgau to France, and Charles IV, Duke of Lorraine, was restored to his duchy upon conditions to which he refused to give his assent. See NIMWEGEN.

NORTHAMPTON.—The treaty of peace by the provisions of which Edward III of England renounced all claims of dominion which had been assumed over the kingdom of Scotland was concluded with King Robert I, 4 May 1328.

NOYON.—The wars that arose from the League of Cambray were terminated by the treaty of peace signed by Francis I of France, Charles of Spain, Maximilian, the emperor, etc., 3 Dec. 1516.

NUREMBERG.—The religious truce concluded between Emperor Charles V and the Protestants, 2 Aug. 1532, is known as the Peace of Nuremberg.

NYSTAD.—The Northern War between Russia and Sweden was terminated by the Peace of Nystad, concluded 30 Aug. 1721. By its terms Russia restored Finland, but received, in place of it, extensive territories, including Esthonia, Livonia, Ingria, part of Karelia, etc.

OLIVA.—Sweden, Poland, the Empire and Brandenburg participated in the peace treaty which was concluded at Oliva, Prussia, in 1660. By renouncing Courland, Sweden obtained important concessions from Poland.

OLMUTZ.—The Olmutz Conference between Prussia, Austria and Russia, 29 Nov. 1850, put an end to the revolts in Hesse and Schleswig-Holstein. The Elector of Hesse was reinstated and Schleswig-Holstein was restored to Denmark.

OSNABRUCH.—See WESTPHALIA, in this article.

PARIS.—There have been many so-called treaties of Paris. See PARIS, TREATIES OF. The following are the most important peace treaties:

1763.—A peace treaty was signed at Paris, 10 Feb. 1763, between Great Britain on one side and France, Portugal and Spain on the other. By its provisions Great Britain received Canada, Prince Edward Island, Cape Breton, Dominica, Tobago, Saint Vincent, Grenada, Mobile and all the territory east of the Mississippi from France, restoring to her in return Guadalupe, Miquelon, Martinique, Pondicherry and Saint Pierre, and ceding to her Saint Lucia. In return for Florida Great Britain restored Havana and ceded Louisiana to Spain.

1783.—The Peace of Paris, which terminated the Revolutionary War, was signed between Great Britain on one side and the United States, Spain, and France on the other, 3 Sept. 1783. In addition to the acknowledgment of the independence of the United States the treaty provided that the navigation of the Mississippi should be made free to all parties to the agreement; that Florida and Minorca should be restored to Spain; that France should control the region of the Senegal, etc.

1814.—The treaty popularly known as the "First Peace of Paris," was concluded between France on one side and Great Britain, Austria, Prussia and Russia on the other, 30 May 1814. In addition to acknowledging the independence of the Netherlands, Switzerland, and the German and Italian

states, many territorial changes were made, both by the treaty and at the Congress which met later at Vienna.

1815.—This treaty, known as the "Second Peace of Paris" was concluded between the same parties as the treaty of 1814, having been signed 20 Nov. 1815. By its terms France was reduced practically to the limits of 1790; the sum of \$1,400,000,000 was assigned as proper recompense to the allies for the expenses of the war, and, among other things, it was agreed that the fortresses of the northern frontier should not only be occupied by the allies for a term of five years, but that such garrisons should be paid by France.

1856.—By the Peace of Paris, concluded between Russia on one side and Turkey, Great Britain, France, and Sardinia on the other, 30 March 1856 Russia abandoned her claim to a protectorate over the Christians in Turkey, the neutralization of the Black Sea was proclaimed and several important territorial changes were made.

1898.—The most recent Peace of Paris was concluded between the United States and Spain, 10 Dec. 1898. According to its terms Spain relinquished her sovereignty over Cuba, and ceded Porto Rico, Guam and the Philippine Islands to the United States in return for the payment of \$20,000,000.

PASSAROWITZ.—By the Treaty of Passarowitz, concluded 21 July 1718, between Turkey and Austria and Venice, Venice ceded the Morea to Turkey, while Turkey ceded a large tract of territory, including Bosnia and part of Serbia, to Austria.

PASSAU.—A treaty concluded between the Elector Maurice of Saxony and King Ferdinand in behalf of Emperor Charles V. This agreement, granting freedom of religion to the Lutherans, was signed 16 July 1552.

PEACE OF MONSIEUR.—See MONSIEUR, in this article.

PEKING.—The Peace of Peking, concluded between China and Great Britain and France, Oct. 1860, provided for the ratification of the Treaty of Tientsin (q.v.), and arranged the payment of indemnities and other concessions on behalf of China.

PERPETUAL PEACE, THE.—See FRIBURG, in this article.

PERSIA.—The treaty of peace between Great Britain and Persia, at the conclusion of the war over the taking of Herat, was signed at Teheran, 14 April 1857.

PETERSBURG, SAINT.—See SAINT PETERSBURG, in this article.

PINEROLO.—An agreement reached between the English Commonwealth and France, 1655, by which further persecution of the Waldenses by the Duke of Savoy was permitted.

PLESWITZ.—Although finally signed at Poischwitz, the armistice between Napoleon and the Russian and Prussian sovereigns, concluded 1 June 1813, is usually known as that of Pleswitz, owing to the fact that the negotiations were chiefly conducted at that place.

PORTSMOUTH.—The treaty of peace between Japan and Russia, conducted through the mediations of the United States, was concluded 5 Sept. 1905, at Portsmouth, N. H. See PORTSMOUTH, TREATY OF.

PRAGUE.—The first Treaty of Prague was concluded between Ferdinand II, emperor, and the Elector of Saxony, in 1635. By its terms the latter assumed control over Lusatia.

PRAGUE.—By the second Treaty of Prague, concluded between Prussia and Austria, 23 Aug. 1866, the Lombardo-Venetian kingdom was annexed to Italy and the Germanic Confederation was dissolved.

PRESBURG.—The Peace of Presburg was concluded between France and Austria, 26 Dec. 1805. By its terms Austria ceded her Venetian territories to Italy; Tyrol, Passau, etc., to Bavaria, and her Swabian territories to the South German States. Bavaria and Wurtemberg were also made kingdoms.

PRETORIA.—The treaty of peace that put an end to the South African War was concluded at Pretoria, 31 May 1902. By its terms Great Britain took possession of the Transvaal Republic, the Orange Free State, etc.

PRUTH.—The Peace of Pruth, which is also known as the Treaty of Falczi, was concluded at Hush, between Russia and Turkey, 23 July 1711. By its provisions Peter the Great and his army were released from the blockade; and Charles XII of Sweden was permitted to return home without being molested, in return for territorial cessions made by Russia to Turkey.

PYRENEES.—The treaty of peace concluded between France and Spain, November 1659, not only arranged for the cession of considerable Spanish territory to France, but also provided for a marriage between Maria Theresa, Infanta of Spain, daughter of Philip IV, and Louis XIV of France.

RASTATT.—The agreement for the termination of the war between Austria and France was reached at the Congress of Rastadt, in 1714.

RASTATT.—The treaty known as the Peace of Rastadt was the agreement which preceded the treaty of Baden (q.v.). It was concluded between France and Austria, 6 March 1714.

REUL.—The treaty of peace between the French Parliament and the Court, at the conclusion of the "First Fronde," was signed at Reul in 1649.

ROESKILDE.—By the Treaty of Roeskilde, concluded 28 Feb. 1658, Denmark ceded Schonen, Halland, Bornholm and Drontheim to Sweden.

RYSWICK.—The Treaty of Ryswick, concluded between France on one side and England, the Netherlands and Spain on the other, 21 Sept. 1697, marked the end of French support of the Stuarts by the recognition of William III as king of England. Many conquests were restored and several territorial exchanges were made.

SAINT GERMAIN-EN-LAYE.—The peace Treaty of Germain-en-Laye was concluded in 1679 between France and Brandenburg. By its terms Brandenburg was compelled to cede the greater part of its Pomeranian conquests to Sweden.

SAINT PETERSBURG.—The peace treaty between Russia and Prussia, by the terms of which the former restored all her conquests to the latter, was concluded 5 May 1762.

SAN ILDEFONSO.—The treaty of peace which concluded the revolution of La Granja was signed at the castle of Ildefonso in August 1836. By its terms Queen Maria Christina of Spain was compelled to restore the Constitution of 1812.

SAN STEFANO.—A treaty of peace concluded between Russia and Turkey, 3 March, 1878. By the terms of this agreement, which terminated the Russo-Turkish War the independence of Rumania, Serbia and Montenegro were recognized; the principality of Bulgaria was created, while Russia was to receive important territorial cessions as well as a war indemnity of 300,000,000 rubles. This treaty was much altered by the Congress of Berlin which met in the following June. See ADRIANOPLE; SAN STEFANO, TREATY OF.

SARDINIA.—The agreement by which Sardinia consented to assist Great Britain and France by providing a military contingent to serve against Russia in the Crimean War is known as the Sardinian Convention.

SCHONBRUNN.—A treaty concluded between Napoleon I and Prussia, by which the latter ceded Cleves, Ansbach and Neuchatel to France. It was signed 15 Dec. 1805.

SCHONBRUNN.—The second treaty signed at Schonbrunn is also known as the Treaty of Vienna. It was concluded 14 Oct. 1809, between Napoleon I and Francis I of Austria; its terms provided that Austria should not only join the Continental system and pay a war indemnity, but that she should cede territories to Bavaria, Warsaw, Russia and France. Those ceded to France were formed under one government, the Illyrian Provinces, by Napoleon.

SERPUL.—The Peace of Serpul, between the Russians and the Bokhariots, was concluded in 1858. By its terms the Emir pledged himself to remain a firm ally of Russia. Valuable territorial concessions were also made.

SEVILLE.—A peace between Great Britain, Spain and France, concluded in 1729. It was this treaty that left Great Britain in possession of Gibraltar.

SHIMONOSEKI.—The treaty of peace concluded between China and Japan 17 April 1895, and by the terms of which China agreed to recognize the independence of Korea, ceded to Japan the southern portion of the province of Shingking, the island of Formosa and the Pescadores; pay a war indemnity of about \$175,000,000, and open the ports of Shashih, Chungking, Hangchow and Suchow.

SISTOVA.—A treaty of peace concluded between Turkey and Austria, 4 Aug. 1791. The boundaries which were adopted under the provisions of this treaty were very similar to those of the Treaty of Belgrade.

SPAIN WITH AMERICA.—See PARIS, 1898, in this article.

STOCKHOLM.—A treaty concluded between Great Britain and Sweden by the terms of which the duchies of Bremen and Verden were ceded to George I as Elector of Hanover, in consideration of the payment of 1,000,000 rix-dollars.

SZATHMAR.—By the terms of the Peace of Szathmar, concluded between Karoly and Hungary, in 1711, the emperor agreed to redress all grievances, both civil and religious, besides promising amnesty to all adherents of Rakoczy's, and the restitution of many of the confiscated properties.

SZEGEDDIN.—The treaty of peace which Hunyades extorted from the sultan of Turkey rescued a large Christian territory from the Moslem yoke. It was concluded 12 July 1444.

TAFNA.—The peace signed between General Bugeaud, for France, and Abd-el-Kader, 30 May 1837, is known as the Treaty of Tafna.

TESCHEN.—The peace which ended the War of the Bavarian Succession was concluded at Teschen, between Austria and Prussia, 13 May 1779.

THORN.—Two peace treaties have been concluded at Thorn between Poland and the Teutonic Order. The first treaty was signed in 1411; the second, in 1466. By these treaties the Order made important cessions to Poland.

TIEN-TSIN.—A treaty concluded between China on one side and the United States, Great Britain, France and Russia on the other, 26 June 1858.

TILSIT.—The peace between France on one side and Russia and Prussia on the other was concluded at Tilsit in 1807. The treaty between France and Russia was signed 7 July, that between France and Prussia on 9 July of that year. By the terms of the peace a portion of Prussia was set aside as the grand duchy of Warsaw, another portion of Prussia was ceded to Russia, and a smaller portion to Saxony; Dantzic was made free; Prussian harbors were closed to the

trade of Great Britain; the Prussian army was reduced to 42,000 men and the Confederation of the Rhine and Joseph, Louis and Jerome Bonaparte were recognized. Russia, on her part, entered into a secret alliance with France.

TOLENTINO.—By this treaty concluded between Pope Pius IV and Napoleon, the pontiff ceded Avignon, Bologna, Ferrara, the Comtat-Venaissin, the Romagna and Ancona to France. The agreement was signed in February 1797.

TURIN.—A peace between France and Savoy was concluded at Turin in 1696.

TURIN.—The armistice negotiated between Bonaparte and Sardinia in 1796 is known as that of Turin.

TURKMAUCHAV.—By the terms of the peace treaty concluded between Russia and Persia in 1828, Russia acquired, among other cessions, control over Persian Armenia.

ULM.—The armistice concluded in 1647 between the French and Swedish forces on one side and the Bavarians on the other has since been known as the "Truce of Ulm."

UNFORTUNATE PEACE.—This title is frequently applied to the Treaty of Cateau-Cambresis (q.v.).

UTRECHT.—The Peace of Utrecht, which consisted of several separate treaties, was concluded in 1713 between France on one side and Great Britain, Holland, Portugal, Prussia and Savoy on the other. With the treaties signed later at Rastadt and Baden it terminated the War of the Spanish Succession, for, by its provisions, it stipulated that the crown of Spain, which should never be united to that of France, should revert to Philip V of Bourbon. The Protestant succession in England and Prussia's rights as a kingdom were also recognized. Among the several territorial changes, Great Britain received Newfoundland, Nova Scotia, etc., with the right to send African slaves to America; the Spanish Netherlands, Sardinia, Milan and Naples were ceded to Austria; Sicily was given to Savoy by Spain; Portugal received additional territories in South America, while Prussia took Neuchatel and Gelderland upon the renunciation of its claims upon Orange. See **UTRECHT, PEACE OF**.

VERDUN.—The conflict between the sons of Louis the Pious, immediately succeeding his death, was the first great dynastic quarrel of modern Europe. By the Treaty of Verdun, the agreement of partition which followed the battle of Fontenay, in 843, the Teutonic principle of equal division among heirs triumphed over the old Roman principle which provided for the transmission of the individual empire.

VERGARA.—The treaty between the Carlists and the Cristinos, in Spain, was terminated by a treaty concluded at Vergara 1 Aug. 1839.

VERSAILLES.—The preliminary agreement which preceded the peace of Frankfort (q.v.) was concluded between France and Germany at Versailles, 26 Feb. 1871. See **VERSAILLES**. For the Peace Treaty 1919, see **WAR, EUROPEAN**.

VIENNA.—Several treaties have been concluded at Vienna. Those of the greatest importance are as follows:

1725.—A treaty between Germany and Spain, concluded 30 April 1725. By its terms the two sovereigns confirmed to each other such portions of the Spanish dominions as were then in their possession, while Spain guaranteed the Pragmatic Sanction. By a secret treaty signed at the same time Germany agreed to endeavor to restore Gibraltar to Spain, and to use effort to place the pretender on the throne of Great Britain.

1738.—A treaty between Charles VI of Germany and Louis XV of France, concluded 18 Nov. 1738. By its terms Austria ceded the Two Sicilies to Don Carlos of Spain, receiving the duchies of Parma and Piacenza in return; Lorraine was ceded to France, and the Duke of Lorraine received Tuscany. It was this agreement that terminated the War of the Polish Succession.

1864.—The treaty which ended the Schleswig-Holstein War was concluded between Austria and Prussia on one side and Denmark on the other, 30 Oct. 1864. By its terms the king of Denmark renounced all rights over Schleswig-Holstein and Lauenburg.

1866.—The treaty of peace between Austria and Italy, by the terms of which the former gave up Venetia to Italy, was concluded 3 Oct. 1866.

VILLAFRANCA.—The war of 1859 between France and Austria was brought to an end by the treaty signed at Villafranca by Francis Joseph and Napoleon III, 11 July 1859. This treaty was preliminary to that of Zürich (q.v.).

WEDMORE.—A treaty of peace concluded between King Alfred and the Danes (about 860) by which the latter bound themselves to remain peacefully on that side of England which lay north and east of "Watling Street."

WERELA.—A treaty of peace was concluded between Sweden and Russia, at Werela, Finland, in 1790.

WESTMINSTER.—By the Treaty of Westminster, signed 19 Feb. 1674, the United Provinces relinquished their conquests of the New Netherlands to the king of England.

WESTMINSTER.—The so-called "Peace of Westminster," signed by France and England 13 Oct. 1655, admitting the freedom of the neutral flag.

WESTPHALIA.—The Peace of Westphalia, which terminated the Thirty Years' War, consisted of treaties signed at Munster and Osnabruck, the general peace being signed at Munster, 24 Oct. 1648. By its provisions Switzerland and Holland were declared independent of the German Empire;

Sweden obtained Hither Pomerania, Wismar, etc., with three votes in the Diet and a cash indemnity; France received most of Alsace, and was confirmed in the possession of other territories; Brandenburg received Further Pomerania, etc.; Lusatia went to Saxony; the Upper Palatinate to Bavaria; the Rhine-Palatinate reverted to the electoral house of the Palatinate, a new electorate being created for it; the Peace of Augsburg was confirmed (its provisions being also extended to the Calvinists) and autonomy was secured to the German States. See **WESTPHALIA, PEACE OF**.

ZNAIM.—The truce between France and Austria which followed the battle of Wagram 12 July 1809, has since been known as the "Armistice of Znaim."

ZÜRICH.—The Peace of Zürich was concluded between France and Sardinia on one side and Austria on the other, 10 Nov. 1859. Based on the preliminary treaty signed at Villafranca (q.v.), its terms provided that Austria should cede Lombardy (except Mantua and Peschiera) to France, she ceding them to Sardinia. In return Sardinia assumed responsibility for three-fifths of the debt.

PEACH, a small tree (*Amygdalus persica*) of the family *Amygdalaceæ*. It is supposed to be a native of China, whence it has been carried by man, by way of southwestern Asia and the Mediterranean region, to all warm temperate climates throughout the civilized world. It has been cultivated since prehistoric times and to-day it ranks among the 12 most important fruits of the world. The original species is not identifiable, and many botanists suppose that originally the peach and the almond were identical. The two trees are much alike in habit and appearance, and many intermediate grades of their fruit are known. The peach attains heights of 15 to 20 feet, bears lanceolate leaves singly, in pairs or threes, in the last case two of the buds usually being flower-buds with a leaf-bud between them. Flower-buds are also borne upon short spurs which live only two or three years. Since the flower-buds open in very early spring, before the leaves appear, they are frequently injured by frost. The fruits (drupes) vary greatly in size, downiness, color, adherence to or separation from the stone and color of flesh.

About 300 varieties are cultivated in the United States, popularly classed as clingstone and freestone, white-fleshed and yellow-fleshed. Price, a Texas horticulturist, has given a systematic classification as follows: (1) *Peen-to* race, flat, greenish-white, medium-sized, early varieties, suitable for cultivation only in the Gulf States; (2) *South China* race, flattened-oval, rather small fruits with curved apex; (3) *Indian or Spanish* race, hairy, yellow, late, often streaked, firm fruits; (4) *North China* race, large, mostly cling or semi-cling fruits with slightly curved beaks; (5) *Persian* race, the common peaches, white or yellow-fleshed, cling or free, of the Northern and Central States, also cultivated extensively in Georgia, California and other great peach-producing districts. There are also smooth-skinned peaches, nectarines, which may originate from peach seeds, or from sport-buds upon peach trees, and are propagated and cultivated in the same way as peaches, but to only a small extent commercially.

Peaches are always propagated by means of seeds, which are usually stratified in sand during the autumn, and allowed to freeze during the winter in order to crack the shells and thus hasten germination. The seeds are planted in light soil six or eight inches asunder in rows two and one-half or three feet apart. The young plants are cultivated like other inter-tilled crops until they are large enough to be budded with the desired varieties. This is usually in June in the South, and from early

A TYPICAL PEACH BRANCH

August to mid-September in the North. In the South the trees may be ready for setting in the orchard during the autumn; in the North the buds do not grow until the following spring and the trees are not ready for planting until the succeeding autumn. In the operation of budding the buds are set as close to the ground as the operator can place them, and when they start to grow the original top is removed so as to force all the food into the young sprout. When set in the orchard the young trees is buried at least as deeply as the point of union of stock and scion. Peach trees more than one year old from the bud are rarely planted because they are less satisfactory than yearling trees.

The peach will succeed upon almost any soil if not too wet; it thrives best, however, upon light, sandy, gravelly or shaly soils, where the fruits are superior in color and flavor to those produced on heavier soils, though these latter may yield more succulent fruits. Heavy lands have a further disadvantage since they generally induce late and rank growths, which are not only at the expense of productivity but are very prone to be winter-killed. The inferior color of fruits on such land can be partially corrected by distant planting, and by admitting light and sun to the trees by open pruning. More important than soil is situation. Since the blossom-buds open very early, the peach orchard should be situated on a northern slope, preferably on high ground where the coldness of the air will counteract the sun's warmth on thawing winter days and in early spring. The later they can be made to open, the better. For this purpose many growers spray their trees in early winter with whitewash so that the twigs will reflect rather than absorb the sun's rays. Nearness to large bodies of water is always desirable if the prevailing wind during winter and spring comes from that direction. The most successful peach areas in the North are on the eastern shore of Lake Michigan and the southern shores of Lakes Erie and Ontario.

In the orchard the trees are planted about 20 feet apart, though upon very light soils, and when given special care as to pruning and tilling they may be set even 12 feet apart. Usually in such cases, however, each alternate tree is removed when the branches commence to interfere with one another. The land is deeply plowed and harrowed either in early spring or autumn, and the trees set in rectangles or hexagons, the latter being preferred in California because a larger number of trees can be planted on a given area and the land can be kept cleaner, since it may be cultivated in three directions instead of two. In arid and semi-arid regions the orchards are irrigated. In regions where there is danger of late growth, they are sown with crimson clover, rye or some other cover crop, to check growth and thus ripen up the branches already formed. In the following spring this crop is plowed under. Care must be taken, however, to prevent the undue accumulation, by this practice, of nitrogenous plant-food in the soil, and for this reason also nitrogenous fertilizers must usually be withheld, since such tend to produce rank growth of tender wood. Potash and phosphoric acid fertilizers may be applied without stint. At planting time the trees must be severely cut back, only a small part of the main stem and

one or two buds upon the best placed twigs being allowed to remain. In subsequent seasons the twigs must be severely pruned back, usually less than half the wood produced being allowed to remain and often two-thirds being removed. Pruning should occur in the spring just as the buds are swelling, since at this time those that are living can be easily distinguished and the pruning done most judiciously. Summer pruning is rarely done, but thinning the fruit is a general practice. This operation is performed after the "June drop," when the imperfectly set fruits fall off. Many growers remove more than half the fruits set; others insist that the remaining fruit be from 5 to 10 inches apart. This practice results in a saving of plant-food and consequent annual productivity. It also increases the size and quality of the specimens. Even under the best of management the trees will seldom live much longer than 25 years, and in commercial orchards they rarely exceed 10 years of profitable service, having come into profitable bearing when three or four years old.

With perhaps no other fruit did methods of marketing change so radically during the closing half of the 19th century as with the peach. In the fifties the fruit was generally sent to market in large baskets or even piled loosely in wagons. Now, although half bushel baskets are still used to some extent, small packages are the rule, a favorite package being a crate containing six veneer baskets each holding two or four quarts. Another popular package is the climax basket holding from 5 to 10 pounds, provided with a handle, and covered with netting or a thin board. The fruit is gathered while still firm but when full grown and well colored. Enormous quantities of peaches are used as dessert and still larger amounts are canned or dried. In some sections peach brandy is also made upon a small commercial scale.

The peach is the victim of several insidious and inexplicable so-called diseases, as well as of several whose origin, life-history and control have been fairly well worked out. Probably the most widely dreaded of the first group is yellows. This malady attacks all varieties of peaches, of all ages and on all kinds of soils. It appears on the tree, first as a tip growth late in autumn or before general growth in spring, the tips of twigs and especially of water-sprouts and suckers when present being most often attacked. The small, stiff, narrow leaves of these growths stand approximately at right angles to the short stem. The second symptom is slender, the appearance of wiry shoots with stiff leaves developed on the trunk and main branches. Often these form tufts. Finally slender growths of new wood bearing small, narrow yellow or reddish leaves, appear often in great abundance in the centre of the tree. An infallible sign after the trees are in fruit is the red spotted fruit, the flesh of which is usually mottled red. Premature ripening of the fruit is common and decrease of size and increased fuzziness mark the second year's crop. Since no remedy has been discovered, and since the disease is considered contagious, the trees should be dug out and burned as soon as possible. New trees may be planted where the old ones have stood. The disease is purely American, and has been known for over a century. Trees rarely live more than five years after being attacked. It is

more prevalent in Northern than in Southern orchards.

During the closing decade of the 19th century a new inexplicable disease called "little peach" appeared in the peach belt of Michigan and in western New York. The fruits continue small and hard, the trees decline in vigor and die in a few years. No remedy has been discovered, and as the affection is contagious, grubbing and burning must be enforced.

Of the controllable diseases the following are the more common and destructive if unchecked. Fruit-rot or twig-blight (*Monilia fructigena*) destroys the young twigs and foliage, especially in the centre of the tree. It is most commonly recognized by the rotting of the fruits, which may hang as "mummy" peaches for a year or more after they have destroyed the specimen. Since these mummies are sources of infection they should be gathered and burned. Further treatment consists in spraying the dormant trees in very early spring with a copper-sulphate solution (1 pound to 25 gallons of water). When the buds commence to swell, an application of Bordeaux mixture diluted to 75 gallons should be given and another when the buds open. Other sprayings should be given as the fruit approaches maturity, a clear fungicide being used. Thinning of the fruit and the admission of light and air by open pruning are helpful preventive measures. Leaf-curl (*Exoascus deformans*) seems to have a pronounced liking for some varieties, especially soft, dark-leaved ones. The leaves become wrinkled, yellowish or reddish and contorted, but are at first only somewhat blistered. It appears in spring, particularly in moist weather, and may defoliate the trees by midsummer, though slight attacks seem to do no marked injury. Spraying before the blossoms open, as recommended above, and once after they fall, has been found effective. If the weather is dry and clear the last mentioned application may be omitted. Black spot (*Cladosporium carpophilum*) appears as dusky dots upon the fruit, especially in damp atmosphere. Their confluence often checks the development of the part attacked and the fruit may crack open or be lop-sided. Spraying as for fruit rot has been found satisfactory. See FUNGICIDES.

Among the numerous insects which feed upon the peach the following are often troublesome: Peach twig borer, the larva of a European moth (*Anarsia lineatella*). It passes the winter as a larva, and in the spring burrows into the growing shoots, which fail to develop. It has become a scourge in the Pacific Coast orchards, but is little known in the Eastern States. The fruit-tree bark-beetle (*Scolytus rugulosus*), a general borer, often attacks the peach. Since it prefers ailing trees the girdling of unprofitable specimens is recommended, these trees serving as decoys for the females to lay their eggs in. The trees are to be cut and burned. The peach-tree aphid (*Myzus persicae*) and the black peach aphid (*Aphis persicae niger*) are often troublesome but may be controlled with kerosene emulsion. Several leaf-chewing insects often cause damage; for instance, the peach-tree leaf-roller (*Ptycholoma persicana*), and the New York weevil (*Ichthyocerys novaboracensis*), all of which are more or less perfectly controlled by arsenites, lime being added

to prevent injury to the foliage. Several scale insects and bark-lice are often serious enemies. The most troublesome insects, however, are the curculio (see PLUM) and the peach-tree borer (*Ageria crinitosa*). This latter is the caterpillar of a clear-winged, day-flying, wasp-like moth, which lays its eggs usually near the ground on the trunks from midsummer until autumn. The larvæ bore beneath the bark to the cambium layer, feed on the young wood, pass the winter in the larval form in little shelters made of peach gum, castings, etc., and after eating actively for several weeks in the spring, pupate for about three weeks. The adults emerge in the North during midsummer, in the South in late spring. The trunks of peach-trees should be examined during October and April, and the larvæ grubbed out and destroyed. They are easily discovered by the castings and gum. Most frequently they are within six inches below or above the surface of the ground. See FRUIT-GROWING; FRUIT INDUSTRY.

A., 'The American Peach Orchard' (New York 1913).

PEACH-TREE CREEK (Atlanta), Battle of. After the engagement at Smyrna Camp Ground (q.v.), 4 July 1864, General Sherman secured three crossings of the Chattahoochee River above Gen. J. E. Johnston's position, with good roads leading to Atlanta; whereupon Johnston on the night of the 9th crossed to the east side of the river. On the 17th Sherman ordered a general advance on Atlanta, and by night the entire army formed a general line along the old Peach-tree road. On the night of the 17th General Johnston was relieved from command of the army confronting Sherman, and was succeeded by Gen. J. B. Hood. His army numbered about 51,000 men, strongly posted about four miles in front of Atlanta, on the south bank of Peach-tree Creek, holding the line of that stream and the Chattahoochee for some distance below the mouth of the creek. On the 18th and 19th Sherman's army, with General Thomas' Army of the Cumberland on the right as a pivot, swung to the right and, all advancing, closed in on Atlanta. General Schofield's Army of the Ohio occupied Decatur and then moved toward Atlanta. The Army of the Tennessee, under Gen. J. B. McPherson, destroyed several miles of the Augusta Railroad east of Decatur, and then closed in on that place. Thomas, after some sharp

skirmishing, put his heads of columns across Peach-tree Creek by several bridges, but there was a gap of two miles between him and Schofield, which he partially closed on the 20th by two divisions of the Fourth Corps, Newton's division of the same corps being left on the Buckhead road, on the left of Hooker's 20th Corps. When Hood, on the 19th, knew that Thomas was crossing Peach-tree Creek, he determined to crush him before he could entrench, and then turn on Schofield and McPherson. General Cheatham's corps was Hood's right, Hardee's his centre and Stewart's his left. Cheatham was to hold his left on the creek to separate Thomas from Schofield and face Schofield and McPherson, while Hardee and Stewart, moving by division in echelon from the right, went against the flank and front of Thomas to drive him back to the creek and then down it toward the Chattahoochee into the narrow space formed by the river and the creek, into a sort of pocket. The order was given to advance at 4 p. m. of the 20th and sweep the field. Bate's division, on Hardee's right, passing by Newton's left, found no enemy in its immediate front, and failed in an effort to reach Newton's flank. Walker's division, in Hardee's centre, struck Newton's division, bent back both flanks and, after a severe struggle, was driven back with great loss. A part of Hooker's corps assisted Newton. Hardee was about to renew the attack on Newton, with Maney's and Cleburne's divisions, when Cleburne was withdrawn to go to the extreme right, and Hardee gave up further attack. On Hardee's left Stewart made a furious attack upon Hooker, whose troops had not fully taken position. Geary's division had crossed the creek more than a half mile above Howell's Mill, and was on high timbered ground, with its right thrown forward, and the 33d New Jersey was thrown to a bare hill some distance in advance. Williams' division was moving up to connect with Geary on the left and Palmer's division of the 14th Corps on the right. Ward's division was near Collier's Mill, on Geary's left and rear, near the banks of the creek to the rear and right of Newton's division, from which position its brigade commanders led their men against the flank of Walker's division, engaging Newton. Stewart, moving by division in echelon, first struck the 33d New Jersey, almost enveloping it, driving it back and taking many prisoners. It then fell upon Geary, Ward and Williams, in quick succession making a series of determined assaults, continuing until night, when he was finally repulsed and withdrew to the works from which he had advanced, with a loss of about 2,000 men. The Union troops engaged numbered about 20,000, the Confederates about 19,000. The Union loss, killed and wounded, was about 1,600, of which nearly 1,500 fell upon Hooker's corps; the Confederate loss, killed and wounded, was about 2,500. Consult 'Official Records' (Vol. XXXVIII); Cox, 'Atlanta'; Van Horne, 'History of the Army of the Cumberland' (Vol. II); Sherman, 'Personal Memoirs' (Vol. II); Johnston, 'Narrative of Military Operations'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

E. A. CARMAN.

PEACOCK, Thomas Love, English novelist: b. Weymouth, Dorset, 18 Oct. 1785; d. Hal-

liford, 23 Jan. 1866. He was at first in mercantile life in London (1808-09); secretary to Sir H. R. Popham. In 1819 he was appointed to the East India House, and in 1836-50 was chief examiner to the company. He wrote some ambitious but artificial poems, such as 'Rhododaphne, or the Thessalian Spell' (1818); but found his true field in the satirical novel, 'Headlong Hall' (1816); 'Melincourt' (1817); 'Nightmare Abbey' (1818); 'The Misfortunes of Elphin' (1829); 'Crotchet Castle' (1831); 'Paper Money Lyrics and other Poems' (1837); and 'Gryll Grange' (Fraser 1860). These maintain real humor, and the later ones, if they lack for invention, are nevertheless interesting from the frank expression of prejudice with which they abound. His characters are, however, delightful, more types than real living personages. The lyrics interspersed through these volumes are Peacock's best verse. His works were edited by Garnett in 1891. Peacock made the acquaintance of Shelley and his wife in 1812 while on a tour through Wales, and the friendship continued throughout the life of the more famous poet. On his death Shelley made Peacock his executor, together with Byron; and the former was indefatigable in his collection of material of all kinds relative to the life and work of Shelley. Consult Brett-Smith, 'Peacock's Memoirs of Shelley with Shelley's Letters to Peacock' (London 1909); Freeman, A. M., 'Peacock' (New York 1911); Saintsbury, G. E., 'Essays in English Literature 1780-1860' (London 1890); Van Doren, Carl, 'Life of Thomas Love Peacock' (New York 1911); Vincent, L. H., 'Dandies and Men of Letters' (Boston 1913).

PEACOCK. See PEAFOWL.

PEACOCK, The. See HORNET, THE.

PEACOCK-BUTTERFLY, a butterfly (*Junonia cenia*) of medium size, so called from the "eyes" on its wings, which resemble those on peacocks' feathers. The forewings are of a reddish-brown color, with black, fawn and orange markings. The hind-wings are similar in general color, but less red. This butterfly is known over nearly the whole of the United States, in some localities as the "buckeye." The caterpillar is gray in color with longitudinal stripes, and orange bars and dots transversely, and it is studded with black branched spines throughout its whole length. It is to be seen on the mullens about the beginning of July.

PEACOCK AND ÉPERVIER, Battle of, in the War of 1812. On 12 March 1814 Master Commandant Lewis Warrington ran the blockade of New York harbor and sailed for southern waters in the new sloop of war *Peacock* (20 short 32's and two long 12's). On the morning of 29 April he sighted the British brig *Épervier* (16 short 32's and two short 18's), Capt. R. W. Wales. At 10.20 the two ships were at close range but the British gunnery was light and reckless whereas the American guns were well aimed and steadily fired, with the result that in 45 minutes the *Épervier* was hulled 45 times, her rigging was badly cut up, eight of her guns were disabled and her deck was a shambles, 23 of her crew of 128 having been killed or wounded. The *Peacock's* hull was not touched and she suffered only slight injury to her rigging, while only two of her crew were slightly wounded. Though chased by two

frigates, Warrington saved his prize and brought her into Savannah. From June to October he cruised near the Faroe and Canary Islands, burning or sinking 12 prizes valued at \$493,000 and making cartels of two more. Consult Adams, 'United States' (Vol. VIII, pp. 181-84); 'American State Papers, Naval Affairs' (Vol. I, pp. 313-14); Barnes, James, 'Naval Actions of the War of 1812' (pp. 191-96); Cooper, J. F., 'Naval History' (Vol. II, pp. 130-32); James, William, 'Naval Actions' (pp. 39-42); Mahan, A. T., 'War of 1812' (Vol. II, p. 258 et seq.); Roosevelt, 'Naval War of 1812' (pp. 311-16); Spears, J. R., 'History of Our Navy' (Vol. III, pp. 66-79); Wiley and Rines, 'The United States' (Vol. V, pp. 481-82).

PEACOCK-FISH, a European wrasse (*Crenilabrus pavo*) inhabiting the Mediterranean, so named from its gaudy colors.

PEACOCK-FLOWER. See POINCIANA.

PEACOCK-PHEASANT, a small pheasant of the gorgeously ocellated genus *Polyplectron*, species *chinquis*, which inhabits the forests of the foothills of the Himalayas of Indo-China. The males have two or more—up to five—spurs on each leg. The hen lays but two eggs before sitting. The characteristic call of the male is a clear, strong whistle. The peacock "eyes" from which it gets its name cover the long feathers of the wings.

PEAFOWL, birds of the genus *Pavo*; the type of the sub-family *Pavoninae* of the pheasant family (*Phasianidae*). The genus comprises two or perhaps three species of the Indo-China region and neighboring islands of southern Asia, one of which has been extensively domesticated as an ornamental bird in Europe and America. The common peafowl (*Pavo cristatus*) is sufficiently familiar to require no description beyond the rectification of a very common error. The splendid plumes which are the chief glory of the peacock are not the tail quills, but the tail coverts. When these are erected and spread the true tail quills are exposed at their base, and are quite plain and ordinary. They, however, furnish a support for the spread of the tail coverts.

The wooded hill-country of India and Ceylon is the native home of the peafowl and here they are common in a wild state. When courting, the male struts like a turkey-cock, and usually secures three or four hens. They commonly live in small flocks. The wild peahen lays from six to eight eggs, and produces only a single brood in each year. The nest is of rude construction, and is placed on the ground, or rarely on low branches or in ruined buildings. The period of incubation extends over 25 or 30 days. The young birds of both sexes are feathered alike for the first two years; and in the third year the tail coverts of the male begin to develop. In cold climates, while the birds seem to thrive, they do not breed readily.

In Bengal, Java, Sumatra, etc., shooting the wild peafowl forms a favorite amusement, and large flocks of these birds are occasionally met with by sportsmen. In India peacocks are held sacred to certain castes and various superstitions are connected with them; in Greek mythology it was the favorite bird of Juno. The peacock was domesticated at a very remote

period and some uncertainty exists concerning the exact time of its introduction into Europe. From India it was probably brought to Persia and Media. Aristophanes speaks of "Persian Peacocks." Suidas terms it the "Median Bird." The fleets of Solomon brought these birds to Judea. Alexander the Great brought them to Europe; and they were first seen in Rome about the end of the republic, and speedily became objects of interest to the sybaritic tastes of the day. Pliny says that the orator Hortensius was the first who made a table delicacy of these birds, this worthy presenting them at a feast given to the College of Augurs. Vitellius and Heliogabalus introduced at their feasts dishes composed of the brains and tongues only of peacocks. In the Middle Ages in Europe peacocks were still deemed meet dishes for the tables of the great, although in modern times the flesh is accounted coarse and tough. In ancient Greece, in the time of Pericles, those birds brought high prices. From India they were also brought to Asia Minor, and thence into the Isle of Samos, where they were bred and consecrated to Juno, who was alleged in mythological legends to have adorned their tails with the eyes of her favorite, Argus. From Europe they were in turn introduced into Africa and America. A fossil form of the peacock was discovered in California in 1908 and has received the name *Pavo Californicus*.

In domestication the food consists of grain of various kinds, but at times may be quite varied. The young in temperate climates usually require some attention in rearing. They also lay more numerous eggs than in the wild state. The cry of these birds is popularly said to be repeated before the fall of rain. The peafowls are said occasionally to live to a great age; but from 20 to 30 years appears to be the average limit of their existence. The dark-blue-shouldered or jappanned peacock is generally regarded as a variety of the common species, but, as it breeds true, it has been described as a separate species. The male is the darkest of all peacocks, and the female almost white. From this variety doubtless has been developed the sacred white peacock of India. A somewhat similar form, however, sometimes appears as a sport from the common species. The Javan peafowl is certainly a distinct species (*P. muticus*) found in Burmah and Java. It has a neck of metallic green with golden glints, and a crest of a different form from the common species. The female in this species is almost as gorgeous as the male.

Consult Beebe, C. W., 'Monograph of the Pheasants' (London 1915).

PEAKE, Elmore Elliott, American novelist: b. Decatur, Ohio, 25 March 1871. He has published 'The Darlings' (1900); 'The Pride of Tellfair' (1903); 'The House of Hawley' (1904); 'The Little King of Angel's Landing' (1906).

PEALE, pēl, Charles Willson, American artist: b. Chestertown, Md., 16 April 1741; d. Philadelphia, Pa., 22 Feb. 1827. He turned from saddlery to portrait painting, received some instruction from J. S. Copley at Boston and in 1770 became a pupil of Benjamin West in London. In addition to portraiture, he studied mezzotinto engraving, modeling in wax and casting and molding in plaster, in all of

which he showed facility. In 1774 he opened a studio at Annapolis, Md., and in 1776 at Philadelphia. He was elected to the Pennsylvania legislature in 1779. In 1802 he opened at Philadelphia Peale's Museum, including collections of portraits and objects of natural history. Peale was not only a collector of natural curiosities and a lecturer on natural history, but turned his hand to a half dozen or more means of livelihood. It is said that he himself sawed the ivory on which his miniatures were painted, molded the glass that covered them and made the shagreen cases that enclosed them. His considerable fame in the United States is due less to genius than to two fortunate circumstances. For many years he was the only portrait painter of worth in the colonies and widely in demand, and he associated his art with the name of Washington, who granted him 14 sittings and whom he portrayed in all guises, from colonel of Virginia militia, to bust portraits. Among his other subjects were Robert Morris, Hancock, Gates, Baron de Steuben, Comte de Rochambeau, Franklin, Nathanael Greene, Jefferson, Hamilton, Monroe, Jackson, J. Q. Adams, Calhoun and Clay. Peale had 11 children, all of whom were named after famous artists. Three of these, Rembrandt, Raphaelle and Titian all became artists; and his brother James gained a reputation as a painter of miniature portraits. Consult Dunlap, 'History of the Arts of Design in the United States' (1834); Isham Samuel 'History of American Painting' (New York 1890); Johnston, E. B., 'Original Portraits of Washington' (Boston 1882).

PEALE, Patrick, a pseudonym of Gustav Anton von Seckendorff (q.v.), a German poet and novelist.

PEALE, Rembrandt, American artist and author: b. Bucks County, Pa., 22 Feb. 1778; d. Philadelphia, 3 Oct. 1860. He was second son of C. W. Peale (q.v.). In 1796 he established a studio at Charleston, S. C., where he remained until 1801. He then became one of West's pupils in London and for some time thereafter was occupied at Paris in painting portraits of celebrities for Peale's Museum at Philadelphia, which his father had established sometime previous to this. In 1810 he began painting in Philadelphia. Two of his great exhibition pictures, 'The Roman Daughter' and 'The Court of Death,' attracted much attention. The latter was a canvas 24 × 13 feet, and contained 23 figures. The most of his time, however, was devoted to portraiture. He several times painted Washington, the portrait of 1823 being justly famous. The original was purchased by Congress for \$2,000 in 1832 and many copies were ordered from the artist. This work, whose authenticity is sufficiently indicated by the fact that Chief Justice Marshall called it "more like Washington himself than any portrait I have ever seen," is a truly impressive delineation and has remained favorite among the general public. In 1829 he went to Europe and while there visited France and Italy; and finally, in 1833, he took up his residence in London, after having first returned to the United States. But his restless nature did not allow him to remain there and he drifted back to Philadelphia. His paintings include 'Court of Death' (1820, Detroit Art Gallery); 'The Ro-

man Daughter' (Boston Museum); 'Ascent of Elijah'; and portraits of Gilbert Stuart, Thomas Jefferson, Mrs. Madison (New York Historical Society); Washington (Independence Hall, Philadelphia). Among Peale's writings were 'An Account of the Skeleton of the Mammoth' (1802); 'Notes on Italy' (1831); 'Graphics' (1841); 'Reminiscences of Art and Artists' (1845). His technique was more accurate than that of his father; but his work has in general less life than that of the elder Peale. Consult Lester, C. E., 'The Artists of America' (New York 1846).

PEAN, pa'an, Jules Emile, French surgeon: b. Marboné, Eure-et-Loire, 1830; d. 1898. In 1860 he was graduated in medicine at the University of Paris and was made prosecteur. From 1868 to 1892 he was employed as hospital surgeon in several institutions and in the latter year opened a private hospital. He was elected to the Academy of Medicine in 1885. He was the greatest French abdominal surgeon of his day. In 1864 he performed the first successful operation in France for removal of the ovaries. Many surgical and gynecological instruments were invented or improved by him. He edited Nélaton, 'Elements de pathologie chirurgicale' (1872) and published 'De la scapulargie et de la résection scapulo-humérale' (1860); 'Ovariectomie et splénotomie' (1869); 'Hystérotomie' (1873); 'Leçons de clinique chirurgicale professée à l'Hôpital Saint-Louis' (9 vols., 1879-95); 'Diagnostic et traitement des tumeurs de l'abdomen et du bassin' (1880-89).

PEANUT, a spreading, hairy, annual herb (*Arachis hypogæa*) of the order *Leguminosæ*. It grows about 18 inches tall, bears light green leaves and whitish flowers, after the fading of which the stems bury themselves in the ground, where the one to three-seeded yellowish pods mature. The plant is considered to be a native of Brazil, whence it was introduced into Europe shortly after the discovery of South America, and whence it has been carried by man to nearly all warm climates throughout the world. Since the Civil War it has been an important agricultural crop in the South, especially from Virginia to Georgia and in Tennessee, where the plant is known locally as "goober-pindar," "ground-pea," etc. The crop averages about 20,000,000 bushels annually, three-quarters of which is recleaned for roasting and sale as a luxury, either alone or in confectionery, etc. This use is distinctly American; in the Old World the "nuts" are used mainly for making oil and for stock-feeding. Peanut butter, soups, cakes, etc., are manufactured, but have not become widely popular. From 25 to 50 per cent of oil may be expressed from the shelled nuts, and this, if carefully prepared, is useful for cooking and in the arts. The "hay" is fed to stock, as also is the cakes left after the oil is expressed. Pigs are often profitably turned upon the fields after the harvesting of the crop, and still more profitably upon unharvested fields. The cost of digging is thus saved and the peanuts make a good quality of pork, which, however, is somewhat soft and should be hardened by feeding corn to the animals.

Peanuts thrive best upon very light, sandy loam, well supplied with lime. They are also favored by an early warm spring and a hot,

humid summer. The soil should be deeply plowed and finely harrowed, and the unshelled seeds at the rate of about two bushels to the acre, planted about an inch deep, at intervals of a foot in rows about 30 inches apart, as soon as the weather has become settled in the spring. Until the plants shade the ground the surface must be kept loose and open and free from weeds, especially turf-forming grasses and similar weeds. Before danger of frost the plants are harvested with special implements, dried in loose shocks for two or three weeks, the pods removed and sent to "recleaning" establishments, where they are finished for market. Under ordinarily good management 50 bushels of "nuts" and two tons of straw should be obtained from an acre. In Europe the peanut is perhaps best known as ground nut and earth nut. See PEANUT INDUSTRY, THE.

PEANUT INDUSTRY, The. The people of the United States consume upward of \$35,000,000 worth of peanuts annually, while during each year the country produces from 600,000,000 to about 800,000,000 pounds. This is not a very large fraction of the total world's supply, which is estimated to be 2,400,000,000 pounds. The exportation from Africa and India to Europe reaches to about 450,000,000 pounds annually. Of this vast quantity about 50 per cent goes to France, the bulk of it being pressed for oil. The peanut is employed mainly as an adulterant of or as a substitute for olive oil and it is so excellent in quality that most people cannot detect the difference. Nearly all the olive oil that comes to the United States is at least mixed with part of the peanut. Peanuts furnish from 30 to 50 per cent of the weight of their kernels in oil. The latter is somewhat more limpid than olive oil. It serves excellently for lighting, though it does not give so clear an illumination as some other seed oils. Furthermore, it is utilized to advantage in the making of soaps and as a lubricant in machine shops.

During the years between 1861 and 1865 peanut-oil was manufactured by at least four mills in the Southern States, and used as a lubricant by railroads for locomotives, by wood and cotton spinners for their spindles and by housewives instead of lard as shortening in bread and pastry. Though the American peanut is finer, larger and better flavored than any other, it does not contain so much oil as the African nut, and the oil is not of so fine a quality. The oil of the peanut is utilized medicinally to some extent, and fullers of cloth get another employment for it in their business. The "cake" which is left after the oil has been expressed makes an excellent feed for cattle, and is used as such to a great extent, particularly in Germany.

It is said that peanuts were introduced to the United States by the negroes imported from African slavery. Between 1865 and 1870 the cultivation in the United States spread with great rapidity, owing largely to the knowledge of plants gained by individual members of the various armies which at one time or another occupied the eastern section of Virginia. Each year doubled and at times increased threefold its crop over that of the preceding year, so that this country, from being a large importer of West African nuts, was soon able to supply the domestic demand with the home-raised article. Wasteful methods of cultivation and the conse-

quent impoverishment of the land have diminished the yield of the peanut-producing territory in Virginia, North Carolina and Tennessee very seriously.

Norfolk, Va., is regarded as the centre of the peanut trade, and Virginia produces a larger quantity than any other State. The leading peanut counties are Southampton, Nansemond, Isle of Wight, Sussex and Prince George, ranking in the order named, and reporting, in the aggregate, about 75 per cent of the total acreage.

The Southern farmers do not prepare their peanut for market. The crop is delivered to "factories," where the nuts undergo a process of cleaning and sorting. The peanuts are hoisted to the top of the factory building, where they are poured into hoppers, passing downward through chutes and being separated roughly into four grades by the mere action of gravity. The best ones are necessarily the heaviest, being the largest, having the biggest kernels and being most free from "pops." The first, second and third grades are sold to venders of roasted peanuts, either directly or through jobbing-houses. The fourth grade goes into the hands of confectioners, to be used in the making of "burnt almonds" of a cheap sort, peanut candy and common chocolates. Peanuts of the lowest grades are shipped mostly to New York City. Consult Bailey, L. H., 'Cyclopedia of American Agriculture' (New York 1907); Beattie, W. R., 'The Peanut' (in Farmers' Bulletin No. 431, Washington 1911); Roper, W. N., 'The Peanut and its Culture' (Petersburg, Va., 1905).

PEAR, a tree (*Pyrus communis*) of the natural order *Rosacea*. It is probably a native of western Asia and adjacent Europe, whence it has been introduced by man into all temperate climates of the civilized world. The chief producing countries are France and the United States, and in the latter the principal regions are New England, New York, Michigan and the Pacific Coast States, particularly California. Among the fruits of the United States the pear ranks fourth in commercial importance. It is distinctly a cool climate tree, but except certain inferior Russian varieties does not thrive on the cold Western plains. Some of its hybrids with the Chinese sand pear (*P. sinensis*) do well in the South, but their inferior quality is against them. The Kieffer, Leconte, Garber and Smith varieties are most often planted; the first not only in the South, but very generally throughout the Eastern States. This is a chance hybrid between the original species, which was grown for ornament by Kieffer, a Philadelphia nurseryman, and was introduced as an acquisition. It is famous for poor quality, but is extensively used as a substitute for the Bartlett, especially in canning. The Bartlett, a European variety known as Bonchrétien, is the most widely cultivated pear in the United States, being popular in all the pear-growing regions. The most noted variety in point of quality is the Seckel, an American sort, which though of small size is considered the acme of the thousands of varieties cultivated throughout the world.

The pear is generally propagated by means of root-grafting, the scions for which are imported from France. These form what are called standard trees, which are usually planted 20 to 25 feet asunder in the orchard. Dwarf

trees are produced by grafting the pear upon quince stocks, which are also imported from France. They should not be planted closer than 12 feet, and a rod asunder is even better. The usual methods of planting are in rectangles, in "quincunx" form and in hexagons. The first two are popular in the East, the last on the Pacific Coast. The last is generally best because, where distances are adequate, ground can be more economically employed and cultivation may be given in three directions.

The pear will grow upon almost any soil, but thrives best on well-drained heavy loams, except the Chinese hybrids which do best upon lighter soils. Air drainage is as important as water-drainage; therefore, the orchard should be on high ground. The field should be deeply plowed and thoroughly harrowed before the trees are set, and throughout the season the land should be kept loose, open and free from weeds by frequent cultivation. About mid-summer a cover-crop should be planted to conserve the plant-food that might be wasted by leaching during the winter, and also to check the growth of wood and assist in the maturing of that already produced. If leguminous crops are employed for this purpose, they should obviate the necessity of fertilizing heavily, if at all, with nitrogenous fertilizers such as stable manure and nitrate of soda. (See LEGUME; CLOVER, etc.). Applications of phosphoric acid and potash may be given liberally.

After the trees are set the tops should be pretty severely pruned, only two or three buds being left upon from three to five well-placed twigs, preferably near the ground. The ideal form for training the pear resembles that of a vase, because when attacked by pear-blight or fire-blight (see below) the tree can then often be saved, whereas if trained with only one trunk it usually cannot. Each main limb should be made to divide and redivide, thus forming a spreading tree with a somewhat hollow centre. Though the work during the first five years of the orchard's life may seem excessive its value will be appreciated in after years. Dwarf pears should also be trained in this form; but since they must be kept dwarfed (below 12 feet) and since they have a tendency to develop into standards, especially if the scion takes root above the quince stock, they must be severely cut back late each winter. Many growers advocate removing fully two-thirds of the annual growth of the previous season. Care must be taken in pruning all pear-trees to save the gnarly twigs, which are generally of irregular thickness and direction. These are the fruit-bearing spurs. They do not appear upon young trees.

The pear is more noted for self-sterility than most other perfect flowered fruits; the pollen of certain varieties is impotent upon the pistils of the same variety. Failure to set fruit may also result from a variety of causes, such as cold or rainy weather at blossoming time, difference in time of opening of the flowers of adjacent varieties, impotent pollen or pistils due to overfeeding of the orchard, etc. To obviate self-sterility, two or more varieties should be chosen which blossom simultaneously, and these should be planted in adjacent rows, not more than three rows of a kind together—preferably two.

Pears should be gathered when they will

readily separate from the twigs without breaking the fruit-stalks. If allowed to hang upon the tree until fully ripe they usually lose flavor and become more gritty. When gathered they are usually hard and imperfectly colored, but if stored in a cool room and still air, preferably in boxes or drawers, they will acquire both good color and flavor, besides obviating grittiness and decay at the core to a great extent. Freely circulating air, especially if warm, tends to shrivel the fruit, make it decay and impair the flavor. Winter pears may be left upon the trees until danger of frost is feared; then they should be carefully gathered and stored in cold well-ventilated cellars, being removed for ripening to warmer quarters as needed.

Several of the diseases which attack the pear have been treated under the title APPLE. The two most dreaded maladies are pear-blight and leaf-spot. The former is attributed to a species of bacterium which may gain entrance to the tissues at any "naked" point such as a wound, tips of growing twigs, or, especially, through the nectaries and pistils of the flowers, to which it is conveyed by insects. The disease manifests itself by the blackening of the foliage which hangs on the tree. As the organism works its way down the limbs toward the trunk, it discolors the young tissues upon which it subsists just beneath the bark. In early spring there may be a somewhat saccharine exudation from affected parts of the trunk and limbs. Insects carry infection from these places. Hence the advisability of examining the trees and removing diseased parts in late winter. Whenever the operation is performed the affected branch should be removed several inches below the point of discoloration. Many orchardists recommend sterilizing the tools after each operation, using a solution of bichloride of mercury. The disease is believed to be more prevalent upon light, rich and low soils upon which the growth is usually sappy. Some varieties, such as Duchesse d'Angoulême and Kieffer, are considered fairly immune.

Pear-leaf blight (*Entomosporium maculatum*) is distinct from the previous disorder, being a fungus origin. It appears upon the twigs as black spots; upon the leaves as more or less coalescent reddish brown spots; upon the fruit as upon the leaf, the underlying tissues being hard and cork-like, badly attacked specimens often becoming lopsided and cracked. The trees are frequently defoliated from the falling of the leaves. Bordeaux mixture is considered a specific; many varieties formerly failures now being grown successfully where sprayed. Applications should be given at intervals of two weeks from the time the buds commence to swell until early summer, or, in wet seasons, later and more frequently.

Among the numerous other insects that feed upon the pear the following are probably best known and most easily controlled: Fall web-worm, Cecropia moth, eye-spotted bud-moth, white marked tussock-moth, red humped apple-tree caterpillar, codlin-moth, all of which may be combated by spraying with arsenites. The San José scale and the oyster-shell bark-louse, like several of the above, attack pear and apple (q.v.) indiscriminately. (See INSECTICIDE). Several borers are often troublesome, for instance, the sinuate pear-borer (*Agilus sinu-*

atus), a European species which tunnels irregularly in the trunk; and the borers mentioned under APPLE. Digging the insects out is the most satisfactory remedy. The larvæ of the pear-blight beetle (*Xyleborus pyri*) burrow in and cause the twigs to wilt. When discovered the withered twigs should be gathered and burned. The pear-slug (*Eriocampoides limacina*) is the larva of a saw-fly probably introduced from Europe. The slugs, which feed upon the leaves, are covered with a slimy secretion to which powdered lime will adhere; hence its use, and also that of road dust, as a remedy. Arsenites, hellebore, kerosene emulsion etc., are also used effectively. Indeed, forcible spraying with water or a heavy rain is often curative. Unless checked this blight frequently skeletonizes the leaves of even large trees.

Probably the most troublesome pear-pest is the pear-tree psylla (*Psylla pyricola*), a flea-louse which seems to be confined to this tree. It is most abundant from Michigan to Virginia and northward into which region it was probably introduced from Europe about 1832. The orange-colored eggs are laid upon the leaves upon which the red-eyed yellow larvæ feed by sucking the juices. Four or more generations appear before frost, at the approach of which the adults hide for hibernation in crevices of the bark. Among the remedies recommended, scraping the trunks, spraying in winter with crude kerosene and with kerosene emulsion when the buds expand, with a second application just before blossoming, are probably the most favored. The psylla has numerous natural enemies; especially the larvæ of lady-bird beetles and of lace-wing flies. See FRUIT-GROWING; FRUIT INDUSTRY.

H., 'Nomenclature of the Pear: A Catalogue of the Known Varieties Referred to in American Publications from 1804 to 1907' (ib. 1908); Waite, M. B., 'Pollination of Pear Flowers' (in Bulletin No. 5, Vegetable Pathology Division, United States Department of Agriculture, Washington 1895); Field, 'Pear Culture' (1858); Quinn, P. T., 'Pear Culture for Profit' (New York 1869, 1883); Bailey, Liberty Hyde, 'Cyclopedia of American Horticulture' (ib. 1900-02); Jordan, 'Pear Growing in New Jersey' (New Jersey Experiment Station Bulletin No. 142); Saunders, 'Insects Injurious to Fruits' (1889); Smith, 'Economic Entomology' (1896).

PEAR, Balsam, an annual, climbing herb (*Momordica charantia*) of the family Cucurbitaceæ. It is a native of southern Asia and tropical Africa and has become naturalized in the West Indies. The plants attain heights of about 10 feet, climbing by means of tendrils; bear large, dull green, maple-like leaves, yellow flowers, and oblong, yellowish, pointed fruits, for which, as well as for ornamental purposes, the plants are cultivated. They are commonly grown to cover small arbors or close in piazzas and porches. They can be grown wherever the cucumber will succeed and with about the same treatment. Under the name *la-kwa* the plants are grown by gardeners near large cities for sale to Chinese who either eat them in the green

state after boiling, or the red pulpy arils surrounding the seeds after the fruit is ripe. The seeds are oddly shaped and fantastically "sculptured," and are often used in home decorative work.

PEARCE, Charles Sprague, American artist: b. Boston, 13 Oct. 1851; d. 1914. He was a pupil of Bonnat at Paris and in 1885 established his residence at Auvers-sur-Oise, near Paris. His first exhibited picture was shown at the Paris Salon in 1876 and from that time on his paintings appeared in most of the international exhibitions of America and Europe. He was one of the first members of the Society of American Artists, an associate of the National Academy, an officer of the Legion of Honor, a member of numerous foreign orders. He was one of the jury of selection for the World's Columbian Exposition in 1893, and was the recipient of many gold and silver medals and of the grand diploma at Berlin (1914). He began his work as an artist by painting historical scenes, but he gradually left this field for that of modern life; his favorite subject being the peasant life of Picardy. In everything except name and place of birth Pearce was European. His education, his associations, his subjects and his manner of treatment are essentially French. He shows skill in composition and in technique; his drawing is always good, and his tones, though not deep, are harmonious. Among his works are 'Decapitation of Saint John Baptist' (1881); 'Prelude' (1883); 'Toilers of the Sea' (1884); 'Return of the Flock'; 'Meditation'; several portraits, and decorations for the north hall of the Congressional Library (1896).

PEARCERITE. A silver ore consisting of sulpharsenite, Ag_3AsS_3 (or arsenical polybasite). Occurs disseminated in pink barite, and in siderite with galena at Aspen, Colo., also as ore at Marysville, Mont., and the Tintic district, Utah.

PEARL, Frances Mary, English novelist: b. Exminster, Devonshire, 1835; d. Torquay, October 1923. She wrote numerous novels and historical romances which attained popularity both in Great Britain and United States. Among them are 'Unawares'; 'Schloss and Town'; 'Prentice Hugh'; 'The Horse and Away'; 'One Year'; 'The Rose Garden'; 'A Madrigal'; 'Near Neighbors'; 'The Baroness'; 'Mother Molly'; 'Contradictions'; 'Madame's Granddaughter'; 'Alicia Tennant'; 'The Swing of the Pendulum'; 'Paul's Sister'; 'An Interloper'; 'Jacob and the Raven'; 'The Career of Claudia'; 'Donna Teresa'; 'Number One and Number Two'; 'The Ring from Jaipur'; 'The Flying Months.' Miss Pearl was also a successful writer of stories for children. Of these the best known are 'The Blue Dragon' 'The Abbot's Bridge' and 'Scapegrace Dick.'

PEARL, the substance forming the inner layers of the shells of nacreous mollusks, as pearl-oysters, abalones and others. In the mass it constitutes "mother-of-pearl"; when in the form of a detached lustrous concretion it is called "a pearl," and regarded as a gem. In order to make clear the nature of a pearl it is necessary to explain briefly the mode of formation of the molluscan shell. The shell ordi-

narly consists of two distinct portions of different composition. The superficial epidermis, outer layers and margin of the shell are largely horny, while the inner part is composed of numerous layers of a crystalline carbonate of lime with relatively little animal matter. Both are secretions of the outer surface of the "mantle" (see MOLLUSCA), which lines the shell, and by the free outer margin of which the shell grows in concentric additions to its margins. The remainder or attached portion of the mantle is continually secreting calcium carbonate, which is added layer by layer to the inner surface of the shell, which thus increases in thickness. The iridescence is due to the fine irregular striations upon the surface. Now, if any foreign body like a grain of sand, an undeveloped egg, a parasite or an image artificially placed there find lodgment between the mantle and the shell it seems clear that the shelly deposit must envelop it. It is probable also that it will act as an irritant and stimulate secretion at that point, and that it may be rolled about by slight contractions of the mantle, thus remaining free from adhesions to the shell and gaining symmetry. Taking advantage of this known fact, Chinese pearl fishers insert a tiny piece of flinty sand or hard bone between the shell and the body of the oyster. This irritates somewhat as does the lodging of a cinder in the eye of a human being, and the oyster proceeds to cover it with layers of the protective excretion which in time harden and become a beautiful pearl. Such detached portions of the shell, developed as concretions about foreign particles serving as nuclei, are found in many mollusks. Their character naturally partakes of the character of the shell in which they are formed; if that be opaque and dull so also will the pearls; if it have the iridescence and translucency of mother-of-pearl, they will possess these same elements of beauty. It is vain, therefore, to expect to find pearls of value in common edible oysters, as people often do. Comparatively few mollusks have a well-developed nacreous lining to the shells, and only a few of these are adapted to the production of pearls of the texture and lustre which is most prized. They belong chiefly to the *Aviculidæ*, or pearl-oyster family, and to the *Unionidæ*, or family of the fresh-water mussels (q.v.).

The *Aviculidæ* differ from the edible oysters in having a small foot and anterior adductor muscle, a well-developed byssus gland, which secretes a bunch of fibres, by which the animal is attached, and a thick mother-of-pearl layer to the shell. The true pearl oyster (*Meleagrina margaritifera*) has a very wide distribution, being found in nearly all parts of the Indian Ocean, the Red Sea, the warmer parts of the south Pacific, the Gulf of California, Caribbean Sea. There is, however, a very great difference in the color, size, thickness and texture of the shells, and the quality of the pearls produced in the different localities. Pearls have been gathered commercially in many parts of the world, but most of the fisheries have had periods of prosperity and decline, the latter usually resulting from wasteful overfishing. The oldest fisheries are those of Ceylon on banks covering an extensive area off the north coast. These have been fished at intervals from the beginning of the Christian era, and since

the British occupation have been under the control of the government, which derives rich revenue therefrom.

In America the most important fishing ground is in the Gulf of California, centring about La Paz, but extending to the mouth of the Colorado River. These fisheries were operated by the Indians at the time of the conquest by Cortez, who exploited them for the benefit of the Spanish throne. The fishing season lasts for about six months, from June to December. Formerly expert Indian and Mexican divers were employed. Several of these went together in one canoe, acting alternately as diver and helper. The water is so clear that oysters could be seen on the bottom in 50 or 60 feet. The diver, carried down by a large stone, would remain for about a minute and a half, and bring the oysters to the surface in his hands after cutting them loose with a knife carried for that purpose. In order to have the greatest possible lung expanse the divers always worked with empty stomachs, eating nothing until after the conclusion of the day's fishing. If abundant a basket would be lowered and filled. Working in this manner each diver would secure from 125 to 150 oysters daily and the total product for the season of 450 divers would be about 2,000 tons of oysters, yielding pearls and shell valued at about \$400,000. At the present time the chief concessions are controlled by San Francisco firms, and the fishing is conducted by more modern methods. Each diving-crew secures about 300 oysters per day, which are collected by a schooner and carried ashore, where they are opened with knives and the pearls removed. Other American fisheries exist on the coasts of Guatemala and Panama and the island of Margarita. The Red Sea, many of the South Sea islands and the north coast of Australia also supports valuable fisheries. The latter is one of the most recently developed and has grown rapidly in importance. It is conducted by means of diving suits and is very productive, especially of mother-of-pearl, for the shells become here larger and thicker than elsewhere in the world.

Fresh-water mussels (*Unionidæ*) are found in many streams and lakes of Asia, Europe and America. In the United States these mollusks are exceedingly numerous in the Mississippi Valley, both in species and individuals, and are chiefly utilized in the States of Iowa, Wisconsin, Arkansas, Tennessee and Kentucky, but spasmodic periods of excited pearl-hunting in other States have occurred several times and have been productive. The mussels are secured by rakes, tongs, drags or simply by the hands; even a steam dredge is operated in connection with the Iowa button-factories. The value of the mussel fisheries of the United States is about \$3,000,000 yearly, one-third of which is from shells. In Europe the supply is conserved by carefully opening the mussels for examination by means of specially devised tools which do them no injury, and then replacing them in the water. Fresh-water pearls are especially valued because of the great variety and beauty of their colors and are, like the marine pearls, most likely to be found in shells which are distorted or otherwise imperfect in form and growth. The pearl button industry of the United States has reached about \$9,000,000

yearly. The leading States of this industry are Tennessee, Kentucky and Wisconsin.

Bibliography.—Dakin, W. J., 'Pearls' (Cambridge 1913); Herdman, W. A., 'Pearl Fisheries of Ceylon' (Washington 1905); Kunz, G. F., 'Fresh-Water Pearls and Pearl Fisheries of the United States' (Washington 1898); Kunz and Stevenson, 'Book of the Pearls' (New York 1908); 'Gems and Precious Stones of America' (New York 1890); Saville-Kent, W., 'Great Barrier Reef of Australia' (London 1900); Simmonds, 'Commercial Products of the Sea' (New York 1879).

PEARL, The, a Middle-English narrative vision-poem, with marked lyrical elements. ('Sir Gawain and the Green Knight,' 'Patience' and 'Purity' are, with this piece, generally assigned to a single author, since all are in the West Midland dialect, are preserved in the same manuscript and exhibit common stylistic and metrical characteristics. The name of this author is, however, not known, and the evidence for the ascription of the four poems to the same man is not wholly conclusive. 'The Pearl' may be conjecturally dated about 1370. It consists of 101 stanzas of complicated structure, with both alliteration and rhyme, arranged in 20 groups, consisting, with the exception of one group, of five stanzas each. The whole exhibits the most finished artistry, and may be justly regarded as one of the most important of all the earlier poems in the English language. Its sensitiveness to nature, its moral elevation and its deep religious feeling are particularly noteworthy. After the conventional dream-setting, the poet, who has lost his "pearl of great price," beholds a beautiful maiden, in a land of surpassing loveliness, who reveals to him the joys of Heaven, and consoles him in his trouble. Finally he sees in a vision the Heavenly Paradise, with thousands of virgins adorned with pearls, the mystic brides of Christ. The whole has generally been held to be the poet's expression of personal grief at the loss of his little daughter, but this view has in recent years been challenged, and the whole interpreted as an allegorical presentation of purity, symbolized by the pearl, and personified by the maiden. The poet was obviously familiar with theological material, and was generally orthodox in regard to religious questions of his day.

The piece has often been translated into English. Miss Weston's version in the original metre (in 'Romance, Vision and Satire,' Boston 1912) gives an excellent idea of the poem, as does also 'The Pearl: A Middle English Poem,' a modern version in the metre of the original, by Sophie Jewett (New York 1908). A convenient edition is that by Osgood, Boston 1906, with introduction, glossary and bibliographical references. The articles by W. H. Schofield and Carleton Brown deserve especial attention.

WILLIAM WITHERLE LAWRENCE.

PEARL OF THE ANTILLES, a name given to the island of Cuba on account of its fertility and beauty. See CUBA.

PEARL ASH, crude potassium carbonate as obtained by the lixiviation of wood ashes, and the subsequent evaporation of the solution. It is a finer grade of pot-ashes. In early days practically the whole supply of potash came from wood ashes, and great forest areas were

destroyed to get this invaluable chemical. With the spread of population the forests have become too valuable for such uses except in the most remote regions, where no other use of the forests is possible. In some parts of Canada, and in a very few sections of the United States pearl ashes are still produced, and there is also a supply from Russia and Austria.

There is a large difference in the polasti content of various woods. Wormwood is credited with the largest percentage—7.30; vetches have 2.76 per cent; nettles, 2.50 per cent; ferns, 0.63 per cent; grapevines, 0.55 per cent; rushes, 0.51 per cent; beech twigs and branches, 0.48 per cent; oak barrel, 0.42 per cent; pine, 0.045 per cent. In the prevailing process the wood is burned in pits, ferns and vine stalks being added. The resulting ashes are dampened with water and placed in a cask with a perforated false bottom over which a layer of straw has been laid. Hot water is poured in, and the whole allowed to stand for some hours. The liquor is then drawn off from the bottom reservoir by a faucet. If this is strong enough (32° Tw) it is boiled down at once; otherwise it is poured into the next cask to be leached. The residuum from the leaching has considerable value for manure. The boiling down is done in cast-iron pots, and the dried out potash is heated to redness. The crude product is dissolved in water to remove the insoluble substances, the liquor evaporated and the dry product again calcined, when it is graded as "American pearl ashes." The commercial pearl ash contains from 65 to 77 per cent of potassium-carbonate, 2 to 4 per cent of sodium carbonate, 11 to 21 per cent of potassium sulphate and 3 to 7 per cent of potassium chloride. See POTASSIUM.

PEARL BARLEY, a preparation of barley-grain. See BARLEY.

PEARL HARBOR, an inlet on the southern coast of the island of Oahu Hawaii, six miles west of Honolulu. It is landlocked and has a depth of from 50 to 60 feet, but there was a bar at the entrance with only 10 feet of water, thus making the harbor useless for large vessels. In 1884 the United States obtained from the Hawaiian king the exclusive right to establish a coaling and repair station at this harbor. Surveys were made in 1887 and 1897, and the removal of the obstructing bar to the entrance proposed; but nothing was done in the way of improvement of the harbor facilities until the annexation of the Hawaiian Islands by the United States in 1898. With the ownership of the islands an assured fact, the United States government proceeded to make of Pearl Harbor a first-class naval base. A channel four and one-half miles in length was dredged from the sea across the bar and coral reef, to the yard site, with a depth throughout of 35 feet, with a width through the bar of 600 feet, and from that on, of 500 feet. This makes the harbor available for the largest vessels now afloat. The east and west locks provide ample pier accommodations for the discharging and of loading naval stores and supplies; for Pearl Harbor is not intended to enter into commercial competition with Honolulu. The dredging of Pearl Harbor bar was completed toward the close of 1911; and an official entry into the locks was made by Rear-Admiral Thomas in the flag-

ship *California* on 14 Dec. 1911, thus indicating the completion of the work of opening the harbor through to the ocean. Provision was at once made to extend the government drydock to 1,000 feet. The caisson for the drydock was built in San Francisco, Cal., and towed to its destination in May of the following year. The width and depth of the drydock on the sills, at mean high water, is sufficient to permit the entrance of the largest battle ships. The dock as thus planned and executed is the largest in America. Buildings, shops, storehouses, offices, barracks and residences completed, or in the process of completion, promise to make Pearl Harbor one of the greatest drydocks and naval stations in the world, and a strong basis for the United States Pacific fleet.

Bibliography.—Goodrich, Joseph King, 'The Coming Hawaii' (Chicago 1914); Thrum, Thomas G., 'Hawaiian Almanac and Annual' ('Retrospect for 1911,' in 1912 Annual; 'Retrospect for 1912,' in 1913 Annual; 'Retrospect for 1913,' in 1914 Annual, Honolulu 1912-13-14).

PEARL MILLET, sometimes called Egyptian Millet or Cat-tail Millet (*Pennisetum spicatum*), not a true millet. It is a native of tropical Africa, and as grown in the United States is a tall (6 to 12 feet) coarse annual forage plant, with seed-spikes about one foot long and an inch in diameter, and affording a very large yield per acre, well adapted for soiling. It can be cut two or three times in the season. For this purpose it is sown at the rate of four pounds to the acre. If wanted for hay from 8 to 10 pounds must be sown, and it must be cut just before heading or it will be woody. See GRASSES OF UNITED STATES.

PEARL OF ORR'S ISLAND, *The*, a novel by Harriet Beecher Stowe, published in 1862. This story gives a truthful and entertaining picture of the people in a Maine fishing hamlet. The descriptions of the picturesque scenery of the island are graphic and accurate; and the Pennel house, now known as the "Pearl House," and the "grotto," are still objects of interest to visitors.

PEARL OYSTER, a name popularly given to the *Melcagris margaritifera*, mollusks of the family *Aviculidae*, which are not true oysters. See OYSTER; PEARL.

PEARL RIVER, a river of the State of Mississippi, formed by the junction of several streams. It rises in Winston County, flows southwest and then south, and empties into the Gulf of Mexico. Length about 300 miles and it drains an area of 7,000 square miles. In the latter part of its course it forms the boundary between Louisiana and Mississippi. The navigation is obstructed by sand-bars and snags, but it is navigable for flatboats for about 100 miles; while vessels of eight feet draft go up to Gainsville. See BOUNDARIES OF THE UNITED STATES.

PEARL WEDDING. See WEDDING ANNIVERSARIES.

PEARLY NAUTILUS. See NAUTILUS.

PEARSE, pers, Mark Guy, English Wesleyan clergyman and author: b. Camborne, Cornwall, England, 1842. He was educated at Wesley College in Sheffield, studied medicine at Saint Bartholomew's Hospital, London, and in 1863 entered the Wesleyan ministry. He

held pastorates in Leeds, Ipswich, Bristol and other places, and in 1889 became missionary at Saint James Hall in connection with the West London mission, which position he filled for 14 years. He has devoted much time to literature of a religious character and has published 'Daniel Quorm and His Religious Notions' (2 series); 'The Christianity of Jesus Christ—Is it Ours?'; 'The Gentleness of Jesus'; 'West Country Songs'; 'Sermons for Children'; 'Mr. Horn and his Friends'; 'Short Stories'; 'Good Will'; 'Simon Jaspas'; 'Cornish Stories'; 'Homely Talks'; 'John Tregeno-with'; 'His Mark'; 'The Old Miller and his Mill'; 'Rob Rat'; 'Thoughts on Holiness'; 'Some Aspects of the Blessed Life'; 'Praise'; 'Jesus Christ and the People'; 'Short Talks for the Times'; 'In the Banqueting House'; 'Gold and Incense'; 'The God of Our Pleasures'; 'The Story of a Roman Soldier.'

PEARSON, Charles Henry, English historian: b. Islington, 7 Sept. 1830; d. London, 29 May 1894. He was educated at King's College, London, and Exeter College, Oxford; was elected Fellow of Oriel in 1855; was made lecturer in English literature at King's and shortly thereafter professor of modern history. In 1862-63 he edited the *National Review*; in 1865 he withdrew from his chair at King's, and in 1869-71 was lecturer on modern history at Trinity College, Cambridge. After an experience (1871-74) as a sheep-farmer in South Australia, he was appointed by the minister of education of Victoria to prepare a report on the condition of education in Victoria (1877), and he presented a document of value, recommending many changes since introduced. He became professor of modern history at the University of Melbourne and later head of the Presbyterian Ladies' College. In 1878 to 1892 he was a member of the legislative assembly of Victoria and from 1886 to 1890 minister of education, in which capacity he worked effectively toward reorganization and reform; and in 1893 was made permanent secretary to the agent general. He returned to London in 1892. His chief publication is 'National Life and Character' (1893), a work prophesying the decay of European civilization through the disappearance of independent character and genius, due to the increase of democracy in the highly civilized nations of the West; and the growing importance of Chinese and negroes in world politics and trade. Others of his works are 'Russia' (1859); 'The History of England during Early and Middle Ages' (1867); 'Historic Maps of England during the First Thirteen Centuries' (1870); 'English History in the 14th Century' (1876); 'Public Education in Victoria' (1878); 'Reviews and Critical Essays' (1896). Consult Stebbing, William, 'Charles H. Pearson; Memorial by himself, his Wife and his Friends' (London 1900); 'National Life and Character' (1913-14) in which he attempts to show that the white race is doomed to be dominated by the yellow and black races.

PEARSON, Cyril Arthur, English publisher: b. Wookey, near Wells, England, 24 Feb. 1866. He was educated at Winchester College and joined the staff of Sir George Newnes and became manager of the latter's publications. He founded *Pearson's Weekly*, which met with success and subsequently started *Home Notes*,

Pearson's Magazine, *Short-Stories*, *Royal Magazine*, *Lady's Magazine*, *M. A. P.*, and in 1900 his most important publication, the *Daily Express*, a half-penny London paper. In 1905 he secured control of the *Standard* and then of the *Saint James Gazette*. He has since established newspapers in various cities in Great Britain. He became president of the National Institute for the Blind, of the Fresh Air Fund; vice-president of the Tariff Reform League, vice-chairman of the Tariff Commission (1903), and was at the head of many charitable movements. He was knighted in 1916.

PEARSON, John, English bishop and theologian: b. Snoring, Norfolk, 28 Feb. 1613; d. Chester, 16 July 1686. He was educated at Eton and Cambridge and took holy orders in 1639, and the following year he became chaplain to Sir John Finch, Lord Keeper of the Great Seal, and on the outbreak of the Civil War, chaplain to Lord Goring and later to Sir Robert Coke (in London). His first pastoral charge was Thorington in Suffolk. On the Restoration he was made prebendary of Ely, archdeacon of Surrey and master of Jesus College, Cambridge. In 1661 he was appointed Margaret professor of divinity, the following year master of Trinity College and bishop of Chester in 1673. He was a man of prodigious learning, and his 'Exposition of the Creed' is still the best manual of textual and patristic theology in the English language. This was republished in two volumes (1890-91). He also wrote a vindication of the authenticity of the Ignatian Epistles, 'Vindiciæ Epistolarum S. Ignatii' in answer to Daillé, who had contended that they were spurious. This was followed by 'Annales Cyprianici.' Two years after his death his 'Opera Posthuma Chronologica' were published in London. Consult, Churton 'Minor Theological Works' of Pearson (preface, Oxford, 1844); Cheltham, S., 'John Pearson' (in 'Masters in English Theology,' by A. Barry, London, 1877).

PEARSON, John Loughborough, English architect: b. Brussels, Belgium, 15 July 1817; d. London, 11 Dec. 1897. Trained in his profession by Ignatius Bonomi of Durham and by Salvin and Hardwick in London, he early displayed much skill in mediæval design; was employed in several important restorations; and in Saint Peter's, Vauxhall, produced his first (1861) distinctive work. He continued to devote himself to the development of Gothic, giving his attention to no special phase, though he favored early pointed. His name is largely associated with certain London churches, among others, Holy Trinity, Bessborough Gardens; Saint John, Red Lion square, and Saint Augustine's, Kilburn. But he is perhaps equally well known for his cathedral restorations. He became architect to Lincoln Cathedral in 1870, to Bristol Cathedral in 1880. He was also architect to Rochester, Chichester and Wakefield cathedrals; was consulting architect to those of Exeter and Gloucester; and restored the upper part of the north transept front and the south aisles of choir and nave in Westminster Abbey. In 1879 he received a gold medal and the cross of the Legion of Honor at Paris. In 1879 he received "the greatest ecclesiastical opportunity which has been offered to any modern architect" in his appointment as architect for the new cathedral

of Truro, which has been described as the only Gothic work of modern times worthy of the name cathedral. The building was consecrated 3 Nov. 1887, and the completed part opened for service. Pearson's labors were not wholly ecclesiastical, as he also designed county-seats, mansions and other structures. But these works, though excellent in their kinds, added little to his reputation. He was the real founder of the school of modern Gothic, which aims not to copy mediæval precedent but to design anew in the mediæval spirit.

PEARSON, Karl, English educator and sociologist: b. England, 1857. He was educated at King's College, Cambridge, and in Germany, admitted to the bar in 1882, and in that year was appointed professor of geometry at University College, London. In 1885 he was promoted to the chair of applied mathematics and mechanics and in 1911 to that of Galton professor of eugenics and director of the laboratory for national eugenics at the University of London. He is recognized as an authority on eugenics. He received the Darwin medal from the Royal Society (1898). He has published 'The New Werther' (1880); 'The Ethic of Free-thought' (1888); 'The Chances of Death, and Other Studies in Evolution' (1897); 'Enlarged Grammar of Science' (1899); 'History of the Theory of Elasticity and Strength of Materials' with Todhunter (1886-93); 'National Life from the Standpoint of Science' (1901); 'The Life Letters and Labors of Francis Galton' (1914).

PEARSONS, pēr'sonz, Daniel Kimball, American capitalist and philanthropist: b. Bradford, Vt., 14 April 1820; d. 1912. He was graduated from the Medical College at Woodstock, Vt., and practised medicine in Chicopee, Mass., until 1857. He subsequently entered the real estate business in Chicago in which he continued with great success until 1887 when he retired, but retained the office of director in the Chicago City Railway Company. He has devoted much attention to philanthropic work, and his benefactions from 1890-1900 amounted to more than \$2,500,000, much of which was given to more than 45 colleges, the Chicago Theological Seminary and Beloit College in particular receiving a large share of the benefactions, which ultimately exceeded \$4,000,000.

PEARY, pē'ri, Robert Edwin, American Arctic explorer: b. Cresson, Pa., 6 May 1856; d. Washington, D. C., 20 Feb. 1920. He was graduated at Bowdoin College, and in 1881 entered the United States navy as a civil engineer with the rank of lieutenant. From 1884-85 he was assistant engineer in connection with the surveys for the Nicaragua Canal, and later engineer in charge of these surveys. In 1886 he made his first trip to the North, reconnoitring the Greenland ice cap, east of Disco Bay. In 1891-92 as chief of the Arctic expedition of the Academy of Natural Sciences of Philadelphia, he made further explorations, traversing Greenland from McCormick Bay to Independence Bay, in the northeast angle, a trip of 1,300 miles, considered one of the most remarkable polar sledge journeys ever made. He discovered and named Melville Land and Heilprin Land, proved the convergence of the east and west coast of Greenland and determined its insularity. In 1893-95 he again visited Greenland, made a

thorough study of the tribes known as the Arctic Highlanders and discovered the so-called Iron Mountain, a group of three large meteorites. In the summers of 1896 and 1897 he made short voyages and in the latter year brought to the United States the meteorites of Cape York. In 1898-1902, he made his most important expedition in search of the North Pole, under the direction of the Peary Arctic Club of New York City. In August 1898 his ship, the *Windward*, had reached the northern side of Princess Marie Bay, where her progress was stopped by the ice. In December he left the ship, and by sledge reached Fort Conger. He returned to the fort again in April 1899, explored the region of Lady Franklin Bay, and rescued the instruments and records left by Greeley at the fort in 1883. From June to July he explored the Princess Marie Bay region, crossed the Ellsmere ice cap and established a line of caches from Cape Sabine to Fort Conger. In 1900 he again visited Fort Conger, and from there, sledging over the ice, along the northwest coast, reached Cape Washington, lat. 83° 39', but finding further progress barred by an impassable sheet of water turned and explored the east coast to within a degree of Independence Bay. In March 1902 he made another start from Payer Harbor, and traveling over the frozen Polar Sea reached Crozier Island, but after that finding every day's march more difficult, and encountering open leads and floes, he had to abandon his hope of reaching the Pole. He had gone as far as lat. 84° 19'. In August he sailed on his return voyage in the new *Windward*, which had been sent north by the club for him. Careful surveys were made at all stages, and much useful information gained; he determined conclusively the northern limit of Greenland, proved that non-existence of land for a considerable distance to the northward and northeastward and determined the origin of the floe bergs and palæocrystic ice. In 1906 he reached 87° 6' in the *Roosevelt*, within about 203 miles of the Pole. On 6 July 1908 he embarked on the steamer *Roosevelt* for what proved his successful attempt to reach the long-sought-for goal. On 6 Sept. 1909 word was received from Peary that he had reached the Pole on 6 April 1909.

In recognition of his achievement, learned societies throughout the world honored Commander Peary in various ways. Besides the LL.D degree from the University of Edinburgh and a silver ship from the Royal Scottish Geographical Society of Edinburgh, he was awarded the gold medals of the National Geographic Society (Washington), the Royal Geographical Society of London and of numerous foreign geographical societies. On 3 March 1911, by special act, he received the thanks of Congress and promotion to rear-admiral. (See POLAR RESEARCH). He published 'Northward, Over the Great Ice' (1898); 'Nearest the Pole' (1907); 'The North Pole' (1910); 'Secrets of Polar Travel' (1917).

PEARYLAND, northeastern coast of Greenland, between Independence Bay and the 80th degree of latitude, which was discovered by Lockwood and Brainard in 1882 and named Hazen Coast. This was extensively explored by Peary 10 years later.

PEASANTS' WAR, or **THE GREAT PEASANTS' WAR**, a name given to the general rising of the German peasantry in 1524-25 and originally correlated with the "Nobles' War," a term applied to the attempt of the nobles to break free from the power of the princes. The Peasants' War was not an isolated incident, as is clearly shown by the second name given it above. It was an almost inevitable result of the increasing exactions laid upon the peasantry by their masters in a declining feudal system; and it was not the first rising of its sort, for in 1502 and 1514 there had been great revolts called respectively the "bundschuhe" and the "League of Poor Conrad," and in 1515 an uprising in Carinthia and Styria had maintained itself for several months only to be put down by the emperor after great slaughter. Hence it is evident that the true cause of the Peasants' War was something antecedent in time and deeper-seated than the effects of the doctrines of Reformation, though the latter were prominent among the immediate causes. Luther, who, had he sided with the peasants, would have carried with him the great middle class and so assured the success of the cause, attempted compromise, urged upon the princes the justice of certain demands, suggested to the peasants the withdrawal of others, and after a short interval threw the weight of his influence against the insurgents by the publication of his pamphlet 'Against the Robbing Murdering Troops of the Peasants.' The revolt by this time had spread from the southern Black Forest through Austria, the Tyrol, Alsace and the lower Rhine. Its different bands in different places and with Metzler, Geier, Hippler and Rohrbach as leaders, had met with little success save in a few cities where they had worked from the inside, notably Heilbronn, Wimpfen, Dinkelsbühl, Mainz and Trier. A trained soldier, Goetz von Berlichingen, had, however, been impressed as general, and while he was moving on Frauenberg the nobles had joined forces, practically at Luther's suggestion. Philip of Hesse, the Elector John and Dukes Henry and George of Saxony met the fanatic Münzer, one of the foremost of the preachers of the revolt, at Frankenhäusen, killed 5,000 of his men and took him prisoner, 15 May 1525, and executed him soon afterward. In southern Germany repression was equally swift and terrible; the work was done in Alsace by Anton of Lorraine, and in Swabia by George Truchsess who destroyed Weinsberg, and then joined forces (10,000 men) with the electors of the Palatine and of Trier, marched to Frauenberg, and, when the peasants had been deserted by Goetz von Berlichingen, defeated and practically annihilated the army of 2,000 men under Metzler at Königshofen. The atrocities committed by the victors were in the way of a sanguinary warning. Sixty burghers were executed at Würzburg and at Kitzingen 57 were blinded. Schweinfurt, Bamberg and other cities were heavily mulcted in money. The peasants of the mid-Rhine district had been defeated in the meantime by the forces of the Palatine. The general result added greatly to the burden of the peasants. Consult Bax, E. B., 'The Peasants' War in Germany, 1525-26' (in 'The Social Side of Reformation,' part II, London 1899); Cornelius, C. A., 'Studien zur Geschichte

des Bauernkriegs' (Munich 1862); Kautsky, K., 'Communism in Central Europe in the Time of the Reformation' (London 1897); Schapiro, J. S., 'Social Reform and the Reformation' (New York 1909).

PEAT, the partially decayed and compacted remains of mosses and other marsh plants which have become covered with water during the process. Generally the plants grow luxuriantly at the surface but die below and are submerged. The rate of growth is estimated to vary from one to four inches a year and the depth of beds has been found often to exceed 20 feet, but 10 feet or less is more common. The deposits are confined to temperate regions, in both Northern and Southern hemispheres, but especially in the north, where the plants most frequently found in such places are species of sphagnum moss. Peat bogs do not occur or occur but rarely in the warm tropics because the decay of vegetable matter is too rapid to permit of their formation. In the cool north temperate zone the areas covered by peat bogs are enormous. In Ireland estimates place the area of upland bogs at about a million and a quarter acres; that of lowland bogs at more than a million and a half. There are thousands of acres in Germany, Sweden, Norway, England, Scotland, Holland, France and Denmark; and in Russia the area is estimated at 6,700 square miles. In Canada and the United States there are also enormous deposits.

The chief use of peat is for fuel, for which purpose it is most largely employed in Ireland where under the name of turf it is the principal fuel. At a short distance below the surface the peat is brown and somewhat loose in texture; at greater depths it becomes more dense and nearly black; and in many cases it becomes lignite. Owing to the presence of tannin, organic acids, various salts and iron in various forms, which make the substance antiseptic, the plants are so well preserved as to be readily identified and in some cases their perfect condition has led to experiments in their use for the manufacture of textiles from the fibre. Trees, fruit leaves and animal bodies are not infrequently found in as good condition as they might be expected to be after long immersion in a tanning vat. This characteristic is, however, a decided disadvantage when the land is to be used for agricultural purposes, since the reclamation is slow even under the best of management; and as a fertilizer the pulverized peat must be allowed to weather for a considerable time before it can be profitably spread upon other land as a manure. As a manure it is often best applied after being used as an absorbent in stables, where its deodorizing qualities specially recommend it. It also readily gathers and holds the easily-lost nitrogenous salts voided by animals.

In the conversion of a peat bog into arable land drainage is the first requisite. Then application of lime, marl and other soil amendments must be combined with frequent turning of the surface to the weather, especially to the action of frost during winter. During the first years under crop the yields will probably be light if there is any yield at all. Hence it is often advisable to plant only coarse-feeding crops, such as corn and potatoes, which will require the frequent stirring of the soil.

Mineral fertilizers must be given liberally because peat is usually very deficient in such ingredients. And since stable manure seems to accelerate fermentation of the peat it should be applied liberally. Owing to their generally low situation and the consequent settling of cold air upon such areas, reclaimed peat bogs are often unsuitable for many crops which are likely to be injured by cold. They are, however, often admirable for such crops as celery and onions, their fine texture and easy preparation, after once being reclaimed, being decidedly in their favor. They are not, however, enormously rich in plant-food, etc., popular belief to the contrary notwithstanding. American peat contains only about 0.13 per cent of potash, 0.21 phosphoric acid and 0.67 of nitrogen, the last usually in a slowly available form.

In the digging of peat for fuel the bog is partly drained by open ditches, and when the excess of water has disappeared the loose surface is removed and then rectangular "turfs" are cut with specially constructed spades, the blades of which are made in the form of a right angle. The turfs or "peats" are placed on end in little groups until dry, when they are stored under cover. In Ireland, where the operations are performed during spring and summer, men, women and children are employed. And in many cases where the turf is imperfect these people tread the fibrous mud until the peat can be pressed into shape by hand. Owing to its bulkiness, peat cannot be shipped profitably to great distances. The charcoal made from compressed peat is superior to wood charcoal and even compares with coke. That obtained from uncompressed peat is used in tempering cutlery, etc., and as a deodorizer and antiseptic. (See also **BOGS**; **LIGNITE**; **COAL**, etc.; **MINERAL PRODUCTION OF THE UNITED STATES**). Consult Koller, 'Die Torf-Industrie' (Leipzig 1898); Ries, 'Peat' (Mineral Resources, in United States Geological Survey Report for 1901, Washington 1902); Johnson, 'Peat and Muck' (Hartford 1859); Storer, 'Agriculture' (New York 1897).

PEAT-BOG. See **Bog**.

PEATE, pēt, John, American Methodist clergyman and astronomer: b. Ireland, 6 May 1820; d. Greenville, Pa., 25 March 1903. He came to the United States when very young, engaged in manual labor, but contrived to gain an education and was ordained in the ministry, holding various pastorates for a period covering 50 years. As an astronomer he won a national reputation, making a specialty of the manufacture of reflecting telescope lenses. He made over 20 lenses, each of which exceeded 20 inches in diameter; the largest one he presented to the American University at Washington, D. C.

PEAUCELLIER (pō-sēl-ē-ā) **CELL**, in mechanics, a form of linkage which possesses great theoretical and historical interest, because it was the first known apparatus by which an independent accurately straight line could be drawn without the use of a straight-edge,—that is, without resorting to the illogical expedient of paralleling some other straight line. It was discovered in 1864 by C. N. Peaucellier, an officer of engineers in the French army, who was tardily rewarded for it by the "Prix Montyon" of the Institute of France. It consists of seven "links," or bars of metal, which

are connected as shown in the illustration. Four of these are of equal length, and are joined together so as to form a rhombus, $P C D B$. Two other bars, equal to each other in length, but not bearing any necessary metrical relation to the first four, are pivoted to each other at A , and to the original rhombus at B

and C . The point A is fixed in position, and the point D is connected with a fixed centre E by means of a seventh bar, DE , whose length is one-half the distance of D from A when the three points A , D and P are in the same straight line. The circle (shown dotted) upon which D is constrained to move would pass through A if it were sufficiently produced. When the various conditions here given are fulfilled, and the "cell" is moved in any way, the point P describes a straight line which is perpendicular to the straight line joining A and E . For a simple proof of this fact, and for an account of other remarkable linkages discovered subsequent to Peaucellier's, consult Kempe, *A. B.*, 'How to Draw a Straight Line' (London 1877).

PEBRINE, a disease of silkworms. See **SILKWORMS**.

PECAN, pē-kăn' (*Carya olivæformis*), an American nut tree found native in a restricted district in the southern part of the United States and in Mexico. In the United States its original habitat ranged from central Kentucky and southwestern Iowa southward nearly to the Gulf, following generally the river bottom lands. Of late years the commercial demand for this nut has led to its cultivation in plantations of considerable extent, and the area in which it is now successfully grown includes the southeastern part of Virginia; the easterly third of North Carolina; all of South Carolina, Georgia, Alabama and Mississippi except their extreme northern parts; the southern part of Louisiana; the southeastern part of Texas, and the northern half of Florida. There are also occasional small plantings in the Pacific Coast States, and in central and northern California the pecan is proving more profitable than any other nuts. Generally speaking, the pecan does not fruit reliably north of the 39th parallel.

The earlier plantings of pecans in the United States were of seedlings grown from nuts of the wild trees, but the pecan is now successfully budded and grafted, and the later plantations are of nursery grown trees of choice varieties. In the nurseries the seedling trees are grafted or budded when two years old, and are sold two years later. At this age they range from four to seven feet in height, and it is custom-

ary to set them from 40 to 60 feet apart, giving clean orchard cultivation between the trees. The soil best adapted to a prolific yield of nuts is a light sandy loam with clayey subsoil. On richer ground the trees make a more luxuriant growth, but the yield of nuts is smaller.

There are upward of 100 varieties of pecans now listed in the catalogues of the nurserymen, and each particular region of the pecan "zone" has a dozen or more varieties especially adapted to its soil and climate. The favorite variety (where it can be grown) is the "Schley." This is one of the best in form and quality of kernel, is a regular, though not always a large bearer, and its nuts command the top price in the market. The "Stuart" has been more extensively planted than any other. Its nuts are medium to large, and of excellent quality, but the kernels are apt to crumble badly in the cracking machine. "Van Deman" has been very largely planted, but has developed a tendency to scab, which has been disastrous to some plantations. It bears one of the largest of pecan nuts, of good flavor, thin-shelled and a good cracker in the machines; and is an excellent seller in the market. Many other varieties are as good as these which are mentioned. Few varieties, however, succeed along the northern boundaries of the pecan country, and these bear a smaller size of nut, though often are more prolific. For this section, "Major," "Niblack," "Indiana" and "Posey" are in favor.

The pecan trees begin to bear a few nuts about the third year after planting, but this early fruiting is not recommended, and cropping is postponed until the 10th or 12th year, from which time onward commercially valuable crops may be expected.

The yield ranges from 100 pounds up to 1,000 pounds per tree, depending largely upon its size and age. The larger part of the nuts reaching the market are from wild trees and bring up to 25 cents per pound, with an average of 15 cents. Named varieties bring (1916) up to 40 or 45 cents per pound, their cracked-out meats bringing 60 to 90 cents per pound at retail. At these prices they are by far the most valuable nut that can be grown in the United States. Consult United States Department of Agriculture, 'Bulletin 700' (Washington 1916).

PECCARY, the native name of a genus (*Dicotyles*) of small pig-like animals forming the family *Dicotylidæ*, closely allied to the true swine, from which they differ in the character of their dentition and the more complex stomach and some other details. The canine teeth, generally so prominent in the male swine, do not protrude in the peccaries. The bristles are much thicker than in the pig and very long on the throat and head and nape of the neck. The peccaries possess a cutaneous gland, situated on the rump, which secretes an offensive smelling fatty substance. The Indians cut away this pouch immediately on killing a peccary to prevent its contaminating the flesh.

The peccaries form the only indigenous representatives of the swine in America. There are three species of which the collard peccary (*Dicotyles torquatus*) and the white-lipped peccary (*D. labiatus*) are best known. They are said to interbreed readily. The former occurs abundantly in the northern parts of South America, but is found as far south as Patagonia. It is a habitant of Mexico, and is

numerous along the Rio Grande, and has spread northward into the United States into Texas and even as far as Arkansas. These animals go either in pairs or in small flocks, and inhabit holes in the ground, or the hollows of trees. The jaguars pursue them with great vigor. Their food consists of maize, potatoes, sugarcane and similar materials as well as animal matter, and cultivated fields suffer much from their raids. The color of this species, which averages about three feet in length, is a dark gray, the bristles being each marked by rings of gray, straw-color and black, and a white band passes down each shoulder from the withers and round the throat, thus appearing as a kind of "collar." This species of peccary is readily domesticated. The flesh is savory, but less fat than pigs' flesh. Unlike the pigs but two young are produced at a birth.

The white-lipped peccary, found in Guiana and indeed all through northern South America, and as far north as Honduras, congregates in larger bands than the collared species. They appear to migrate in flocks from place to place, and are said to swim well. They are nocturnal in their habits and often invade plantations in great hordes, causing serious damage. They are also said to attack sportsmen with great courage when exasperated, and to inflict severe wounds with their sharp tusks. A white patch or strip exists across the chin and extends backward on each side of the jaw in this species. They are smaller than the collared peccary, being about 40 inches in length. They are preyed upon by the puma and panther, whom they attack with such energy as to force them to take to trees for safety.

PECK, Annie Smith, American mountain climber: b. Providence, R. I., about 1856. In 1878 she was graduated at the University of Michigan, studied German and music in Germany in 1884-85, and studied in the American School of Classical Studies at Athens in 1885-86, specializing in Greek and archæology. Miss Peck taught two terms in Providence schools; later became preceptress in the Saginaw High School; teacher of mathematics in Bartholomew's School for Girls, Cincinnati; preceptress of the Montclair (N. J.) High School; professor of Latin at Purdue University and at Smith College. She has lectured on Greek and Roman archæology and other subjects since 1887. In 1895 she climbed the Matterhorn, in 1897 the peaks of Popocatepetl and Orizaba and in 1900 Funfingerspitze in the Tyrol. Miss Peck made record ascents in South America as follows: Mount Sorata in Bolivia was ascended to a height of 20,500 feet in 1904, and a peak of the Raura Range in Peru to the height of 18,000 feet in 1908, and Mount Huascarán, Peru, to a height of 21,812 feet the same year, and Mount Coropuna, Peru, to 21,200 feet in 1911. She has written 'A Search for the Apex of America' (1911); 'The South American Tour' (1914; 3d ed., 1917).

PECK, Charles Horton, American botanist: b. Sand Lake, N. Y., 1833. In 1859 he was graduated at Union College, Schenectady, N. Y., became professor in the Sand Lake Collegiate Institute and the Albany Classical Institute. In 1867 Mr. Peck was appointed head of the botanical department of the New York State Museum and in 1883 became State botanist.

He published 'Boleti of the United States' (1889); 'Mushrooms and their Use' (1897); 'Plants of North Elba, Essex County, N. Y.' (1899).

PECK, George, American Methodist Episcopal clergyman, brother of Jesse Truesdell Peck: b. Middlefield, N. Y., 8 Aug. 1797; d. Scranton, Pa., 1 May 1876. He began preaching in 1816, was presiding elder of the Susquehanna District in 1824 and in 1835-40 principal of the Cazenovia Seminary. He edited the *Methodist Quarterly Review* (1840-48), and for the succeeding four years was editor-in-chief of the *Christian Advocate*, New York. He held pastorates at Scranton, Wilkesbarre, Providence and Dunmore, and among his books are 'Universalism Examined' (1826); 'Scripture Doctrine of Christian Perfection' (1841); 'Rule of Faith' (1844); 'Reply to Bascom on Slavery' (1845); 'Christian Exertion' (1845); 'Sketches and Incidents' (1849); 'Manly Character' (1852); 'History of Wyoming' (1858); 'History of Methodism within the Bounds of the Old Genesee Conference' (1860); 'Our Country' (1865); 'Life and Times of George Peck,' an autobiography (1874).

PECK, George Record, American lawyer: b. Steuben County, N. Y., 15 May 1843. He was educated in the common schools, served in the artillery during the Civil War, studied law and was admitted to the bar in 1866. In 1871-74 he practised at Independence, Kan.; in 1874-93 at Topeka, and since 1893 at Chicago, Ill. From 1881 to 1895 he was general solicitor of the Atchison, Topeka and Santa Fé Railroad, and from 1895 to 1910 was general counsel of the Chicago, Milwaukee and Saint Paul Railway, since when he has been consulting counsel. In 1905-06 Mr. Peck was president of the American Bar Association. Peck has been a prominent member of the conservative wing of the Republican party.

PECK, George Wilbur, author and State governor: b. Henderson, N. Y., 28 Sept. 1840; d. Milwaukee, Wis., 16 April 1916. He moved to Wisconsin with his parents at the age of three. In his youth he learned the printer's trade and in 1860 bought a half interest in the *Jefferson County Republican*, which was published at Jefferson. He served as a private in the Fourth Wisconsin Cavalry in the Civil War for two and a half years and then returned to his newspaper activities. In 1866 he started at Ripon, Wis., a newspaper called the *Representative* and later became the owner of the *La Crosse Democrat*. He parted with this publication in 1874 and founded the *Sun* at La Crosse. Four years later he removed the plant to Milwaukee and changed the name of the paper to *Peck's Sun*, which became noted because of his humorous sketches, notably the "Peck's Bad Boy" series, favorites generally with boys of a generation ago. His best-known works are 'Peck's Compendium of Fun' (1880); 'Peck's Sunshine' (1882); 'Peck's Bad Boy and His Pa' (1882); 'The Groceryman and Peck's Bad Boy' (1883); 'How Private Peck Put Down the Rebellion' (1885); 'Peck's Boss Book' (1889); 'Peck's Uncle Ike and the Red Headed Boy' (1889); 'Sunbeams—Humor, Sarcasm and Sense' (1900); 'Peck's Bad Boy with the Circus' (1906), and 'Peck's Bad Boy with the

Cowboys' (1907). Mr. Peck was mayor of Milwaukee (1890-91) and governor of Wisconsin (1891-95). He became the State's executive in the revolt against the plan to make public school attendance compulsory, and after his term in office he returned to his love for printers' ink and for the hunting field, being almost as well known among experts in the shooting of wild fowl as he was among readers for his writings.

PECK, Harry Thurston, American critic and author: b. Stamford, Conn., 24 Nov. 1856; d. 1914. He was graduated at Columbia in 1881, was instructor in that institution in Latin and for a time in Sanskrit, and in 1888 became professor of Latin there, after study at the University of Berlin. He succeeded Prof. Charles Short as Anthon professor. In 1895 he became editor of the *American Bookman*, upon the establishment of that magazine, in 1898 an editor of the 'International Cyclopædia' and in 1900 of the 'New International Encyclopædia.' He was also at one time literary editor of the *Commercial Advertiser*. Among his publications are 'The Semitic Theory of Creation' (1886); 'Suetonius,' with commentary (1889); 'Manual of Latin Pronunciation' (1892); 'Roman Life in Latin Prose and Verse' (1895); 'The Personal Equation' (1897); a rendering of 'Trimalchio's Dinner,' with introduction (1898); 'What is Good English? and Other Essays' (1898). He also edited Harper's 'Dictionary of Classical Literature and Antiquities' (1896). He also wrote two successful stories for children, 'The Adventures of Mabel' (1889) and 'Hilda and the Wishes.' Among his works that stand apart from his classical and encyclopedic productions are 'Greystone and Porphyry' (1899), collection of poems; 'The Life of Prescott' (1905); 'Twenty Years of the Republic' (1906); 'Literature and Studies in Several Literatures' (1909), and 'A History of Classical Philology' (1911).

PECK, Jesse Truesdell, American Methodist Episcopal bishop: b. Middlefield, N. Y., 4 April 1811; d. Syracuse, N. Y., 17 May 1883. He was educated at Cazenovia Seminary, entered the Oneida Conference in 1832 and was pastor of various churches until 1837, when he accepted an appointment as principal of the Gouverneur Wesleyan Seminary. In 1841-48 he was principal of the Troy Conference Academy at Poughkeepsie, N. Y., in 1848-52 president of Dickinson College, Carlisle, Pa., and in 1854-58 secretary and editor of the *Methodist Tract Society* in New York. He spent the succeeding eight years in California as pastor and presiding elder. After his return eastward he continued his pastoral work, was one of the founders of Syracuse University and in 1872 he was elected bishop. Among his published works are 'The Central Idea of Christianity' (1855); 'The True Woman' (1857); 'The History of the Great Republic from the Christian Standpoint' (1868).

PECK, John James, American soldier: b. Manlius, N. Y., 4 Jan. 1821; d. Syracuse, N. Y., 21 April 1878. Graduated in 1843 from West Point he took part in the Mexican War and was brevetted major for bravery at Malino del Rey. In 1853 he resigned from the service, but became brigadier-general of volunteers 9 Aug.

1861, and after service in the defensive works of Washington fought in the Peninsular campaign, distinguished himself at Williamsburg and Yorktown, and at Malvern Hill (1 July) was in command of the infantry forces of the Federal rear-guard. Promoted major-general (4 July), he remained until May 1863 in command of the troops left for the defense of the important strategic post at Suffolk, Va. He defended the position successfully against a superior Confederate force under Longstreet and Hill. Subsequently he was on duty on the Canadian frontier, and on 24 Aug. 1865 was mustered out. He organized (1867) the New York State Life Insurance Company at Syracuse and held its presidency until his death.

PECK, Samuel Minturn, American lyric poet: b. Tuscaloosa, Ala., 4 Nov. 1854. He was graduated from the University of Alabama in 1876 and later studied medicine in New York, but has not practised. He has published in verse 'Cap and Bells' (1886); 'Rings and Love Knots' (1892); 'Rhymes and Roses'; 'Fair Women of To-Day' (1896); 'The Golf Girl' (1899), and in prose 'Alabama Sketches' (1902); 'Maybloom and Myrtle' (1910).

PECK, Tracy, American classical scholar: b. Bristol, Conn., 24 May 1838; d. Rome, 25 Nov. 1921. He was graduated from Yale in 1861, studied in Germany, was professor of Latin at Cornell in 1871-80 and occupied the chair at Yale from 1880 to 1908. He was president of the American Philological Association in 1885-86 and director of the American School of Classical Studies in Rome 1898-99. He edited with C. L. Smith a series of Latin authors annotated for college use, and published 'The Authorship of the Dialogus de Oratoribus' (1879); 'Alliteration in Latin' (1884); 'Cicero's Hexameters' (1897), and a large amount of magazine literature. With other writers he annotated numerous college texts. After 1908 he lived in Rome, Italy.

PECK, William Guy, American educator: b. Litchfield, Conn., 16 Oct. 1820; d. Greenwich, Conn., 7 Feb. 1892. He was graduated from West Point in 1844, assigned to the corps of topographical engineers, and served under General Fremont in 1845 on his third expedition to the Rocky Mountains. He was with the Army of the West in the Mexican War, professor at West Point in 1847-55, when he resigned from the army and accepted the chair of physics and civil engineering in the University of Michigan. He was professor in Columbia College from 1857, occupying at his death the chair of higher mathematics and astronomy in both departments of the college. He edited with his father-in-law, Charles Davies, the 'Mathematical Dictionary and Cyclopædia of Mathematical Science' (1855), etc., and wrote 'Elementary Mechanics' (1859); 'Popular Astronomy' (1883).

PECKHAM, Rufus William, American jurist: b. Albany, N. Y., 8 Nov. 1838; d. Alton, N. Y., 24 Oct. 1909. He studied at Albany and in Philadelphia, was admitted to the bar in 1859. He was a brother of W. H. Peckham (q.v.). In 1868 he was elected district attorney of Albany County for three years; during this time a daring express robbery occurred on the Albany railroad bridge and he successfully prosecuted the robbers and obtained their con-

viction. He was counsel for the Albany and Susquehanna Railroad in its suit against the Erie, and had charge of several other important cases. In 1881 he became corporation counsel for the city of Albany. An active member of the Democratic party, he was a delegate to the National Convention of 1876, where he supported Tilden for the Presidency, and also to the convention of 1880. He was justice of the New York State Supreme Court from 1883 to 1886, and was associate judge of the State Court of Appeals, 1886-95. In the last-named year he was appointed to the United States Supreme Court by President Cleveland. Consult Taft, W. H., 'The Anti-Trust Act and the Supreme Court' (New York 1914).

PECKHAM, Wheeler Hazard, American lawyer: b. Albany, N. Y., 1 Jan. 1833; d. New York, 27 Sept. 1905. He was a brother of R. W. Peckham (q.v.). He was educated at Union College, Schenectady, admitted to the bar in 1856. In 1864 he settled in New York, where he acquired a reputation as a constitutional lawyer. He acted with Deputy Attorney-General O'Connor in the prosecution of the "Tweed ring." He was appointed attorney-general of New York in 1884, but soon resigned.

PECKSNIFF, a hypocritical personage in Dickens' novel, 'Martin Chuzzlewit.' He is the father of two daughters, Mercy or "Merry," who married Jonas Chuzzlewit, and Charity, commonly called "Cherry."

PECKVILLE, Pa., town of Blakely borough in Lackawanna County, on the Delaware and Hudson, the Delaware, Lackawanna and Western and the New York, Ontario and Western railroads, six miles northeast of Scranton. There are numerous coal mines and mining is the principal industry. The town has manufactures of silk, powder, lumber and iron and steel ware. The municipality owns the electric-lighting plant. Pop. 5,345.

PECOCK, pē'kōk, **Reginald**, English prelate: b. Wales, about 1395; d. Thorney Abbey, Cambridgeshire, about 1460. He was educated at Oxford, in 1431 was elected to the mastership of Whittington College of London, in 1444 was made bishop of Saint Asaph and in 1450 was translated to Chichester. In 1455 he published the 'Repressor of Over Much Blaming of the Clergy,' a reply to Lollard attacks and a critique of Lollard positions, subtle in argumentation and a pattern of the clear and vigorous English of the time. In a work called the 'Provoker' he denied the authenticity of the Apostles' Creed, a revised version of which he had previously published. By this and similar writings he managed to secure the disfavor of every shade of belief then prevalent in England. He was cited before Bouchier, archbishop of Canterbury, in 1457, who, after Pecock's creed had been condemned, ordered him to recant on pain of death. He obeyed, retired from his bishopric and went into seclusion at Thorney Abbey. His books, 14 in all, were publicly burned.

PECOS (pā'kōs) **RIVER**, the principal tributary of the Rio Grande of New Mexico and Texas, rising in San Miguel County, N. Mex., at the eastern base of Baldy Peak; it flows south and southeast, enters the State of Texas and

empties into the Rio Grande River. In its upper course it flows through a narrow valley, and is one of the most important rivers of New Mexico for irrigation; large storage reservoirs have been built near Carlsbad and Hondo, N. Mex. Its length is about 800 miles, and its volume of water is greatly reduced during the summer months. Its drainage area includes more than 32,000 square miles.

PECTASE, PECTIC ACID, PECTIN. See **PECTOSE**.

PECTINIDÆ, a family of swimming bivalve mollusks, comprising about 40 species commonly known as scallops. They are characterized by a shell sub-orbicular, regular, usually with radiating ribs, but sometimes smooth, especially in deep water, beaks approximate, eared, the anterior ones most prominent, the posterior ones a little oblique. Its members have rows of ocelli, very brilliant in some species, and delicate crescentic gills. Most members of the family attach themselves when young by a byssus, but they quickly release this upon occasion and swim away rapidly. Their agility is such that they can leap out of an ordinary pail. The species number about 175, living on sandy bottoms, down to a considerable depth in all parts of the world, and have a large commercial importance. Many fossil forms remain from Palæozoic time. See **SCALLOPS**.

PECTOLITE (New Lat. "comb-stone"), or **OSMELITE** (Gr. ὀσμῆ smell, and λίθος, stone; so called because of its peculiar odor), one of the zeolites, a hydrous silicate of sodium and calcium, with the formula $\text{HNaCa}_2\text{Si}_2\text{O}_6$, of a grayish or whitish color and pearly or satiny lustre, commonly occurring in radiated masses of needle-like crystals, suggesting the form of a comb, whence the name. It is occasionally found tabular. It is isomorphous with wolastonite, and was long regarded as a weathered form of that mineral. It is subtranslucent, crystallizes in the monoclinic scheme, is soluble in hydrochloric acid, leaving silica. Its chief alteration product is talc. In hardness it is placed at 4.5 and in density at 2.88. It occurs in the British Isles, in Edinburghshire, Scotland, and in Wales, in Monzoni Valley, Tyrol, at Bergen Hill, N. J., etc.

PECTORAL CROSSES. See **CROSSES** AND **CRUCIFIXES**.

PECTORAL SANDPIPER (*Tringa maculata*) popularly called the "grass snipe," and erroneously the "jack snipe," which is a different bird. It is found in wet salt meadows near to but not along the seashore. See **SANDPIPERS**.

PECTOSE, PECTASE, PECTINE, PECTIC ACIDS, a group of closely related substances, found in the cell walls of certain fruits and vegetables during various stages of ripening and to which the power of forming a jelly is due. They are not crystallizable bodies, but can be precipitated from their solutions in colloidal or gelatinous condition by various reagents. The unripe fruit contains *Pectose* which is insoluble in both water and alcohol, but which can be changed to soluble *Pectine* either by heating with dilute acids, or as during ripening by the action of a ferment-like body called *Pectase*, a substance belonging to the "clotting enzymes." (See **ENZYME**). *Pectase*

is always present in the ripening fruit. Pectine is further changed by action of dilute acids or alkalis to a number of different but closely related bodies of rather uncertain composition called the *Pectic Acids*. These pectous substances are composed of carbon, hydrogen and oxygen, exact composition unknown, and related to that section of the carbohydrates, known as the gums. They are insoluble in water, alcohol or acids. Both pectose and pectine may be converted by the enzyme pectase into the gelatinous bodies pectosic acid and pectic acid, consecutively. These acids differ from pectine chiefly in their proportion of water. Pectine swells up and dissolves in water, yielding a viscid liquid which tends to gelatinize as the solution approaches concentration. Pectase is universally present in green plants, being especially abundant in the foliage. It is believed to have some special function connected with the changes taking place in cell membranes during the period of plant growth.

PECULIAR PEOPLE, an English religious sect, who combine certain tenets of the Dunkards and Faith Curists. They are Perfectionists. They claim for themselves the possession of true and undefiled religion, and take their name from a scriptural phrase "a peculiar people" (1 Peter ii, 9). To be a true Christian, with them, is to live without sin, as they profess to do. Their religion has neither mystery or straining effort. They see and can do all things; young and old are equally competent to accomplish this. All are permitted to preach and pray and all who attend their assemblies are members of their church. They reject creeds, sacraments and confessions; they have no ministry. It is one of their fundamental doctrines that James v, 14-15 is to be taken literally, and the British government has sometimes interfered, when their refusal to call in a doctor, or administer medicine, has endangered the life or practically caused the death of some member of the denomination. See RELIGIOUS SECTS.

PEDAGOGY. See EDUCATION, ELEMENTARY; EDUCATION, THE STUDY OF.

PEDAL-POINT, a long-sustained tone in one voice while other voices proceed in independent harmonies. See ORGAN-POINT.

PEDDLER, or **PEDLAR**, a traveling salesman or merchant who carries his goods or merchandise with him from place to place. In most of the United States, peddlers are required to take out a license and to conform to legal regulations, for the protection of the public. In Great Britain peddlers are called hawkers.

PEDEE, *pē-dē'*, **Great**, a river of South Carolina. See GREAT PEDEE.

PEDESTRIANISM. See WALKING.

PEDICELLARIÆ. See ECHINOIDEA.

PEDICULARIS, a genus of herbs of the family *Scrophulariaceæ*, some of which have rather large and finely colored flowers. They have the name louseworts (q.v.) because of an old belief that they produce a lousy disease in sheep. Their acidity renders them obnoxious to sheep; but cattle, goats and swine eat them. Continental Europe and the northern parts of Asia produce many species, as well as North America. *P. sceptrum*, or King Charles' sceptre,

is one of the principal ornaments of marshy grounds in northern Europe.

PEDIMENT, in architecture, the triangular finishing above the entablature at the end of buildings or over porticoes. The moldings of the entablature bound the inclined sides of the pediment. When there are triangular finishings over doors and windows these are also called pediments. In the architecture of the Middle Ages small gables and triangular decorations over openings, niches, etc., are called pediments.

PEDLAR. See PEDDLER.

PEDOMETER, a small, clock-like mechanism which indicates the distance traveled by a pedestrian. The instrument is so constructed that it moves with the motion of the person carrying it, the indicator advancing one degree for each step taken.

PEDRARIAS DÁVILA. See DÁVILA, PEDRARIAS.

PEDREGAL Y CANEDO, *pā-drā-gāl' ē kā-nā-dō*, **Manuel**, Spanish statesman and political writer: b. Grado, in the Adriatic, 1832; d. Spain, 1896. He studied law and entered upon a political career, identifying himself with the Republican party, in the affairs of which he took an active part during the period immediately preceding the abdication of Amadeus I, in 1873. Under the Republican government he was twice Minister of Justice and once Minister of Finance, afterward retiring from public life until 1882 when he became deputy from Oviedo, and with the Republican leaders Azcárate, Salmeron, Labra and others, assisted in organizing the "centralista" which represents the highest principles of the radicals. He wrote 'El poder y la libertad en el mundo antiguo' (1878); 'Estudios sobre el engrandecimiento y la decadencia de España' (1878); 'Nociones de hacienda pública' (1881); 'Sociedades Cooperativas' (1888); 'Elección presidencial de los Estados-Unidos' (1892).

PEDRO II, *pē'dro* (Sp. *pá'dro*), king of Aragon, called THE CATHOLIC: b. 1174; d. Muret, 2 Sept. 1213. He succeeded to the crown in 1196; quarreled with the king of Navarre over his French fiefs; conquered the most of Provence, but gave it up to his brother Alfonso. He married Marie of Montpellier in 1204 and in the same year was crowned by the Pope, a political move calculated to facilitate his projected conquest of the Balearic Islands, and to protect himself against his nobles and the restless Albigensians. He even made Aragon a papal fief, receiving therefor the title of Catholic. In alliance with Castile and Navarre he defeated the Almohades at Las Navas, 16 July 1212. But in 1213 he was defeated and killed at Muret by Simon de Montfort, against whom he fought in alliance with the Albigensians. Pedro II was skilled in Italian and Provençal verse and did much to introduce the Provençal style into Spain.

PEDRO I (ANTONIO PEDRO JOSÉ DE ALCANTARA), called Dom Pedro, king of Portugal and emperor of Brazil: b. Queluz, near Lisbon, 12 Oct. 1798; d. there, 24 Sept. 1834. On the invasion of Portugal by the French in 1807, the royal family fled to Brazil where Dom Pedro became regent of Brazil in 1821. The Cortes angered the colony, a revolution took place and

Dom Pedro, placing himself at the head of the movement, was proclaimed protector and perpetual defender of Brazil. The country being declared independent 1822, he was proclaimed constitutional emperor (12 October) and on 1 December was crowned. In 1825, Portugal recognized the independence of Brazil, and a treaty was made on terms highly unsatisfactory to the Portuguese. His father dying in 1826, Dom Pedro became king of Portugal, but immediately abdicated in favor of his infant daughter, Maria da Gloria, as the Brazilians feared that they were once more to be made dependent upon the mother country. The internal discontent increased, and at length a popular tumult in Rio Janeiro compelled the emperor to abdicate in favor of his son, 7 April 1831, and to return to his native country. In the meantime the crown of Portugal had been usurped by his brother Dom Miguel. He landed at the island of Terceira, in the Azores, issued a decree in favor of Donna Maria, and with the assistance of French and English volunteers began a war which terminated in 1834 in the complete success of the queen's party. On 26 May an agreement was signed by which Dom Miguel was to leave the kingdom forever. He was appointed regent during his daughter's minority, but died before it expired. See *BRAZIL* and *PORTUGAL, History*.

PEDRO II (DE ALCÁNTARA, dā āl-kan'tā-rā), called Dom Pedro II, emperor of Brazil: b. Rio Janeiro, 2 Dec. 1825; d. Paris, 5 Dec. 1891. He was the only son of the Emperor Pedro I, and succeeded to the throne on the abdication of his father 7 April 1831. He married the Princess Theresa Christina Maria, sister of Francis I, king of Naples, in 1843. Brazil prospered greatly under the rule of Pedro II, who was an enlightened ruler and did much to develop its resources in every direction. He was scholarly in his tastes and never sought to employ aggressively even the restricted powers which the Constitution permitted him. During his reign several foreign wars occurred, among them those with the dictator Rosas of Buenos Aires in 1851-52, with Uruguay in 1854-55 and 1864-65 and with Lopez of Paraguay in 1865-70. As a private individual he visited Europe (1871-72) and in 1876 attended the Centennial Exhibition in Philadelphia, being present and assisting at the opening ceremonies. In 1867 Dom Pedro opened the Amazon to the commerce of all nations, and in 1871 a law was passed for the gradual abolition of slavery throughout Brazil; but it was very inefficiently administered. In 1888 a second law was passed providing for the immediate emancipation of the slaves. This turned the rich planters against Dom Pedro who was forced to abdicate in 1889. A pension was granted him by the new Brazilian government and he retired to Paris where he spent the rest of his life. Consult Dawson, T. C., 'The South American Republics' (New York 1903); and Mossé, B., 'Dom Pedro II, empereur du Brésil' (Paris 1899).

PEDRO V, king of Portugal: b. Lisbon, Portugal, 16 Sept. 1837; d. there, 1861. He was the son of Dona Maria II, whom he succeeded under the regency of his father, Prince Ferdinand of Saxe-Coburg-Gotha, in 1853. The most important events of his minority were the conclusion of the extradition treaties with France

and Belgium and the commercial treaties with the South American states. The regency of his father ended 16 Sept. 1855 and Pedro devoted himself to strengthening the financial condition of the country and further industrial arts. He died of yellow fever contracted by assisting his plague-stricken subjects in 1861.

PEDRO, Dom, DUKE OF COIMBRA, regent of Portugal: b. Lisbon, Portugal, 9 Dec. 1392; d. Alfaroabeira, Portugal, 20 May 1449. He was the second son of John I of Portugal; while very young commanded the first expedition against Ceuta. He spent four years 1424-28, in travel and visited even the court of Bagdad where he was received with high honors. After the death of Edward I the people became dissatisfied with the regency of the queen and Pedro skilfully contrived his own appointment to the office. He proved a wise and tactful ruler and arranged the marriage between the young king Alfonso V, and his daughter Isabelle in 1446. After the accession of the king a quarrel arose between Pedro and his brother, the Duke of Bragança, over the office of constable of the kingdom. The king took the part of Bragança, a civil war ensued and Dom Pedro was killed in battle at Alfaroabeira.

PEDRO THE CRUEL, king of Leon and Castile, not to be confused with Pedro IV of Aragon, who was called "the Cruel," but more commonly "the Ceremonious": b. Burgos, 30 Aug. 1334; d. near Montiel, 26 March 1369. He was son and successor (1350) of Alfonso XI, whose mistress, Leonor de Guzman, he imprisoned, and whose illegitimate children he persecuted cruelly. He was married to Blanche of Bourbon in 1353 and abandoned her in three days. The following year he married Juana de Castro and left her at the end of two days. These two desertions made him many enemies, for the friends of both women openly opposed and joined forces with his brothers who were in open rebellion. His general administration of Castile was very severe. On the death of the Seigneur of Biscay, Pedro imprisoned the two daughters and sought the life of the three-year-old son of the Seigneur; seized the province and killed Garcilasso de la Vega, who attempted to interfere. He murdered his brother Fadrique and the king of Grenada, while the latter was his guest, and picked a quarrel with Pedro IV of Aragon (also styled "The Cruel"), who called in the help of the Castilian king's natural brother Henry of Trastamare at the head of the famous mercenaries, the White Companies. This war with Pedro IV continued from 1357-61. Henry established himself as king of Castile in 1366. He had been in exile in France; but headed a body of exiles and another of mercenaries and was openly backed by the Pope, France and Aragon. Pedro persuaded Edward the Black Prince to espouse his cause; and the latter invaded Castile in 1367 and defeated the exiles at Nájera. He and Pedro disagreed over the treatment of prisoners and other matters, and Edward went back to Guyenne where he was governor. Rebellious bands and parties sprang up everywhere. Henry returned, headed the new opposition and defeated Pedro at Montiel in 1369. Pedro was treacherously killed a few days after the battle. Consult Burke, 'History of Spain' (1895); Mérimée, 'Histoire de Dom Pedro I, Roi de Castile' (1843); and

García, 'Castila y Leon durante los reinados de Pedro I, etc.' (1891).

PEDRO SANCHEZ. 'Pedro Sánchez' of José María de Pereda centres in autobiographical form about political life in Spain during the middle of the last century. It is one of the few novels of Pereda which deal essentially with life outside of his favorite Cantabrian hills and coast. Even so, the disillusioned hero after struggling as journalist and political officeholder at Madrid and in a provincial town, returns to his native village of the north. Furthermore the story of Pedro's youth affords the author an opportunity for describing the country about Santander. Pereda's dramatic account of the Revolution of 1854 in Madrid is told at first hand, for he spent his student days there during that period. As in all Pereda's novels the ethical and moral questions of life predominate in 'Pedro Sánchez' but do not obtrude. Pereda, a realist, paints life as he sees it, and although he may be prejudiced in favor of rural life against city life with its artificial manner of existence and its temptations, in the main his strictures do not seem exaggerated. 'Pedro Sánchez' is a forceful satire on the mania for office-holding in Spain. Through the hero we can see the author, a rugged, honest, and somewhat reactionary don flaying political corruption. The novel is written in Pereda's purest style. Pereda is one of the greatest stylists in Spanish literature, and must be counted among the masters of modern Spanish fiction. There is an abridged American edition with notes, vocabulary, and a full account of the author and his work with a bibliography by R. E. Bassett, taken from the standard edition of Pereda's works (Vol. XIII).

SAMUEL M. WAXMAN.

PEEBLES, James Martin, American physician and editor: b. Whitingham, Vt., 23 March 1822; d. Los Angeles, Calif., 15 Feb. 1922. Graduated A.M. and M. D. from University of Pennsylvania, and thereafter studied at University of Chicago. He owned and edited several newspapers, in which field he was long prominent, and in 1869 was appointed United States consul to Trebizonde, Turkey. He was president of the California College of Science for four years and of the Cincinnati Eclectic College for three years. Dr. Peebles was also the organizer of the Independent Order of Good Templars, and the first grand chaplain of this order. He represented the United States Arbitration League at the International Peace Commission of Europe. A member of many national institutions of science and learning, Dr. Peebles encircled the world five times, lecturing on travels, hygiene, spiritualism and social reform. He was president of Peebles College of Science and Philosophy (1914). Of his many books and pamphlets may be mentioned 'Seers of the Ages' (1875); 'Immortality and our Homes Hereafter' (1880); 'How to Live a Century and Grow Old Gracefully' (1884); 'The Demonism of the Ages' (1902); 'The Christ Question Settled' (1897); 'Vaccination—A Curse' (1905); 'The Spirit's Pathway' (1906); 'Five Journeys Around the World' (1907); 'Buddhism and Christianity Face to Face' (1909); 'Spirit Mates—Marriage and Divorce' (1909); 'Death Defeated' (1910);

'How to Converse with the Dead' (1911); 'Ninety Years Young and Healthy—How and Why' (1913).

PEEBLES, Mary Louise Parmalee ('LYNDE PALMER'), American author: b. Lansingburg, N. Y., 10 Dec. 1833; d. 26 April 1915. She was graduated from the Lansingburg Academy in 1850 and in 1862 was married to Augustus A. Peebles. As a writer of juvenile books she has gained some reputation and among her works are 'The Little Captain' (1861); 'The Good Fight' (1865); 'Drifting and Steering' (1867); 'Jeannette's Cisterns' (1882); 'Where Honor Leads' (1894), etc.

PEEKSKILL, pēk'skil, N. Y., village in Westchester County, on the Hudson River, and on the New York Central and Hudson River Railroad, about 40 miles north of New York City. It is connected by steamboats with New York, Albany and all the Hudson River ports. Because of its population, Peekskill is called "the largest village in the country," the inhabitants considering the village form of government to be the most advantageous. The village president and the board of trustees serve without compensation. Peekskill is noted for its long established industries and its manufacturing and commercial activities. Railroad and deep water facilities offer great advantages for manufactures. Its 65 industries employ about 2,750 operatives. Among manufactured products are stoves, underwear, nightwear and dress goods, machines and engines, automobile parts, oilcloths, hats, cigars, yeast, vinegar, fire-bricks, bricks, charcoal products, cement blocks and reconstructed stone. A government shipyard is in operation here. Dairy farming on the most modern principles is also a flourishing industry of the neighborhood. The Westchester County National Bank and the Peekskill Savings Bank are two prosperous institutions. Saint Peter's, or the "Old Church," was erected in 1767, and there General Washington as a lay reader of the Episcopal Church read services for his men when his army was stationed in the vicinity. Saint Gabriel's Episcopal Academy for girls is a noted educational institution, and besides two high schools, eight elementary and parochial schools, there are business schools and a training school for nurses in connection with the Peekskill Hospital. The Peekskill Military Academy, Westchester Military Academy, Mohagan Lake School and Worrall Hall Military Academy are located here, and other public institutions of interest are Saint Joseph's Catholic Home for boys and girls, over 1,000 inmates; the House of the Good Shepherd, a reformatory for girls, and Nazes Memorial Home for Children. The Field Public Library has over 7,000 volumes. There are municipally owned welfare stations, Y. M. C. A. and Y. W. C. A. organizations, theatre and movie houses. Well-equipped police and fire departments are maintained, with most of the fire apparatus motorized. The water supply is an important village asset, with 30 miles of mains yielding a daily capacity of 5,000,000 gallons and a daily consumption of 3,750,000 gallons; 15 miles of trolley lines give regular transport service; there are 33 miles of sewer mains; and gas, electric lighting and power service are unlimited for private and industrial needs. The property values are estimated at \$9,001,625.70.

Peekskill village covers an area of six square miles of picturesque location, surrounded by famous country estates. The town maintains Depew Park, covering 67 acres, and named after ex-Senator Chauncey M. Depew (q.v.), who was born here. The former farm and summer home of Henry Ward Beecher lies two miles east of the village. At Verplanck's Point, two miles below Peekskill, Hendrick Hudson anchored the *Halfmoon*, October 1609, and there his sailors had their first encounter with the Indians. Peekskill was settled in 1664 by the Dutch. The Indians had here a village called Sachoes, but the Dutch changed the name in honor of Jans Peek, a Dutch navigator. In 1665 royal confirmation was given and the territory was known as Ryck's Patent. In 1764 several families from England settled here. During the Revolutionary War, Fort Independence, just above the village, was occupied by American soldiers. Continental Village, a fortified camp a few miles northeast, was for a time the headquarters of Generals Parsons and Putnam. It was in Peekskill that Arnold heard of the capture of André. John Paulding, the captor of André, is buried there in old Rural cemetery. Gallows Hill, in whose "Way-side Inn" André was detained after his capture, is about three miles distant. On the north side of Gallows Hill is the spring from which the Mohicans drank. Pop. (1920) 15,868.

PEEL, Paul, Canadian artist: b. London, Ontario, 1860; d. Paris, 25 Oct. 1892. He studied at the Philadelphia Academy of Fine Arts, in 1880 entered the Royal Academy at London, and later at Paris was a pupil of Boulanger and Gérôme. His studio was at Paris, and his work was French in its characteristics. He had a very delicate sense of coloring, and his landscape effects were notably light and airy. His 'How Bitter Life Is' obtained honorable mention at the Salon of 1889. Among his other works are 'Two Friends'; 'Fording the Stream'; 'In Punishment'; and 'The Unexpected Meeting.' In 1890 his 'After the Bath' was awarded a gold medal. It was purchased by the National Gallery of Budapest. Queen Alexandra secured his 'Two Friends' for Buckingham Palace, while the city of Toronto purchased his 'Fording the Stream,' which is now in the city hall of that city.

PEEL, Sir Robert, English statesman: b. near Bury, Lancashire, 5 Feb. 1788; d. London, 2 July 1850. He was graduated from Oxford in 1808; in 1809 entered Parliament as Tory member of Cashel, later exchanged for Chippenham, and in 1810 made his first speech in seconding the address to the throne. In 1811 he entered upon his official career as Under-Secretary of State for the Colonies, but in 1812 he was transferred to the Chief Secretaryship for Ireland, a post whose usual difficulties were at that time much increased by political disturbances. He greatly improved the routine administration of the office, promoted secular education, and for the security of life and property established the Irish constabulary, thence known as "Peelers." But his Tory views and his opposition to Catholic emancipation dissatisfied the extreme members of the Catholic party who generally referred to him as "Orange Peel." In 1817 he was returned for Oxford, thus obtaining the chief parliamentary distinction in the

Tory party; and in 1818 he resigned the Irish secretaryship, whose peculiarly exacting labors he had long since found distasteful. He became chairman of the bullion committee in 1819, and on 24 May, in one of his great speeches, carried resolutions for a return to cash payments, in place of the depreciated paper then in circulation. In so doing he differed somewhat from his party, but established his reputation as a financier. He was made Home Secretary in 1822 and secured an important reform in British criminal law, thus making effective the endeavors of Sir Samuel Romilly and Sir James Mackintosh; and in 1827 he retired from the ministry. In 1828 he became Home Secretary in Wellington's Tory ministry and leader of the House. He made large retrenchments in expenditures, allowed the importation of corn under a sliding tariff-scale, and by the new Metropolitan Police Act reorganized the London force (thence known as "Peelers" and "Bobbies") after the manner of the Irish constabulary. But the cause of Roman Catholic emancipation had now arrived at a point where the ministry must either support it or resign. For the sake of an expedient settlement of the question, the former course was decided upon, and "Orange Peel" in a speech of more than four hours (5 March 1829) introduced the measure. This change in attitude lost him his seat as representative of Oxford (1829). He relinquished his ministerial post when the Tories were driven from power in 1830, and upon the formation of a Whig ministry became the leader of the opposition. He resisted the Reform bill with much adroitness, and when it had been passed in 1832, organized a powerful opposition in the Conservative party, and by a temperate policy gradually regained for modified Tory principles the influence of which Liberal advance had threatened to deprive him. In 1834 he formed with Wellington a cabinet, becoming First Lord of the Treasury and Chancellor of the Exchequer. But in 1835 he was beaten and resigned, but in 1841 he again became Prime Minister as First Lord of the Treasury, and at once proceeded to a thorough reorganization of the finances. In 1842 he carried a tariff measure based on the sliding-scale in operation since 1828; and in the same year a bill for the imposition of an income-tax. By 1845 a surplus of £5,000,000 had replaced a deficit of £2,000,000. The potato-rot in Ireland and consequent famine made cheap corn a necessity, and the activity of the Anti-Corn Law League led Peel to declare in favor of the repeal of the laws. Some of his colleagues disagreed, and he resigned; but he was soon once more in power, and on 27 Jan. 1846 presented the repeal to the House. The measure was passed, but protectionists brought about his defeat on the Irish coercion bill, and he resigned. He gave a general support to the Whig ministry of Lord John Russell, and in the critical time of 1847 he was one of the strongest supporters of the government which he backed up in its free-trade policy, and supported in its efforts to do away with the Jewish disabilities by process of law. On 28 June 1850 he made a speech in opposition to Palmerston's interference in the Greek question; and on the following day he was thrown from his horse while riding through Hyde Park and died from the effects of the fall.

Peel was an eminent statesman and parliamentary leader. In many notable ways he furthered justice and practical reforms, and his foreign policy was wise and pacific. He was noted for private charities and made an important collection of paintings.

Bibliography.—Bagehot, Walter, 'The Character of Sir Robert Peel' (in 'The English Constitution and other Political Essays,' New York 1903); Dalling, 'Sir Robert Peel' (1874); Doubleday, Thomas, 'The Political Life of Sir Robert Peel' (London 1856); Guizot, F. S., 'Sir Robert Peel, his life and Private Correspondence' (3 vols., London 1891); Peel, Sir Lawrence, 'Life and Character of Sir Robert Peel' (London 1860); Stanhope and Cardwell, 'Memoirs by Peel' (London 1857); Taylor and Mackay, 'Life and Times of Sir Robert Peel' (London 1846-50); Thursfield, J. R., 'Peel' (in 'Twelve English Statesmen Series,' London 1891).

PEELE, pēl, **George**, English dramatist and poet: b. Devonshire, about 1558; d. about 1598. He was educated at Oxford, ultimately settled at London as a writer for the stage and was also known as an accomplished actor. He was the associate of Nash, Marlowe and Greene. Of the many dramas of which he was reputed to be the author only a few are certainly known to be his, among these being 'The Arraignment of Paris'; 'The Chronicle History of Edward I' (1593); 'The Old Wives' Tale' (1599); 'David and Bethsabe' (1599). He wrote several pageants, and he also produced other miscellaneous writings from some of which Shakespeare may have borrowed. His blank verse, though often tedious, not seldom rises to something like real grandeur and force, and throughout his works many extremely beautiful lyrics will be found. His writings helped to prepare the way for Shakespeare. His works, edited by Bullen, appeared in 1888. Consult Ward, 'History of English Dramatic Literature.'

PEELE, **John Thomas**, Anglo-American artist: b. Peterborough, England, 1822; d. 1897. He early came to the United States, began portrait painting, but later took up genre-work, in 1846, set up a studio at New York, and in the same year was made a National academician. In 1851 he returned to England, and there he afterward worked. His paintings numbered among others 'Music of the Reeds' (1857); 'Highland Supper'; 'Village School'; 'A Bit of Gossip'; and 'The Bird's Nest.'

PEEP-O'-DAY BOYS, a name given to the Irish revolutionists of 1784. (See **ORANGEMEN**.) They were so named from visiting the houses of their enemies at daybreak in search of arms.

PEEPER, a popular name for several species of the family Hylidæ or tree-frogs, which make a peeping noise in the early spring, when they go to the water for breeding purposes. The title belongs particularly to the small yellowish thin-voiced Pickering's tree-frog (*Hyla pickeringii*), common over all the eastern United States and in Canada westward to Manitoba. This little frog hibernates during December and January and in very cold seasons

through part of February. His is the first voice heard in the spring, either late in February or early March, and he continues "peeping" until the second or third week in May, at which time the other tree-frogs begin their piping. The peeper ranges in color from a light fawn color to a deep wood-brown, and his color varies according to the color of the place where he sits. He is marked with an oblique cross on his back and bars on his hind legs. In size he rarely reaches more than an inch in length. The peeper will become quite tame and may be kept quite successfully in a mossy fernery if fed properly. These little frogs eat prodigious numbers of mosquitoes and gnats, and are themselves eaten by larger frogs. See **TREE-FROGS**.

PEEPING TOM, a common name for an inquisitive person. It was originally "Peeping Tom of Coventry," a person who disobeyed the injunction not to look in the street when Lady Godiva (q.v.) rode by.

PEEPUL, **PIPUL**, **PIPPUL**, **BO-TREE**, or **SACRED FIG**, an East Indian tree (*Ficus religiosa*) of the order *Urticaceæ*. It often attains a height of 100 feet, bears heart-shaped leaves with attenuated points which act as drainage for dew in moist tropical forests. The fruits, which are about the size of a gooseberry, are little used for food. The trees are frequently planted around Hindu temples because tradition says that Vishnu was born under one of these trees, hence their sacredness. Buddhists revere this tree. It is a favorite food-plant of the lac insect and is valued on that account also. Its juice is used as bandoline and as a source of caoutchouc. As an ornamental tree it is specially attractive because the leaves upon their long slender petioles move with the slightest breeze.

PEER GYNT. Ibsen's 'Brand' preached the philosophy of "All or nothing." Relentless, cruel, resolute, overriding in will, Brand went through everything that stood in his way toward gaining an ideal. Another play was needed as a compensating balance, as a complementary color to 'Brand.' That is exactly what 'Peer Gynt' is. Instead of the iron will of Brand, Peer is will-less; instead of sufficient, he is insufficient; instead of resolute, irresolute. In all issues facing him, Peer goes around. 'Brand' was published in Copenhagen, 15 March 1866. By December it had reached its fourth edition. The play had a phenomenal reading success, and people became curious to know what Ibsen's next play would be. The dramatist, about this time, was relieved of financial worry by two money grants, one from the Norwegian government and the other from the Scientific Society of Trondhjem. This enabled him to give to his work an unfettered mind. He went with his family to Frascati, where, in the Palazzo rooms, he looked many feet down upon the Mediterranean, and pondered his new drama. He was soon writing to his friends of its imaginative character. The scenario for 'Peer Gynt' and the first act were completed by 5 Jan. 1867. The details had been planned carefully, and folklore mixed with experience became the matrix for the inconsequent Peer's adventures. Ibsen's own studies in regional folktales had given him a goodly stock to draw from; and there are touches of family history in the play which are less evident than

Ase, who was a rough portrait of Ibsen's mother. This is his most fantastic piece, the one with the most formlessness about it. In it there are germs of ideas worked out more fully in later plays. Peer, the poet and dreamer, has none of Brand's polemics about him. If the world were full of lovable rascals like Peer, who dreams of being what he is not; or full of Stoics like Brand, inflexible, rentless, uncompromising—there would be little human progress.

Ibsen preserved a profound silence about the content of this drama. He begged of his publisher, Hegel, to create as much mystery about it as possible. In his workmanship he became reckless with imagery. That is why 'Peer Gynt' is so formless. He carries Peer from abandoned youth to senile old age in scenes of wild riot. This hero fights his way among nixies, wrestles in the coils of the Boyg—symbol of his own indeterminateness and confusion. He cares nothing for consequences, even though the Green-Clad Woman confronts him with an Ugly Brat, symbol of his lust. Out of sight, out of memory, that is the tragedy of Peer's romance with Solveig. And when the Button-Molder finally calls him to accounting—as Death, in the morality, calls to Everyman, Peer suddenly realizes that he has been a bungler of life, with his motto, "To thyself be enough." In the end, however, he is cleansed in the faith and hope and love of Solveig. 'Peer Gynt' was issued 14 Nov. 1867, and the Norwegian public hailed it vociferously. The critics, in some quarters, were uncompromising in their censure, some sneering at the poetry of it. Whereupon, Ibsen wrote his now famous message: "My book is poetry, and if it is not, then it will be. The conception of poetry, in our country, in Norway, shall be made to conform to the book." Many read satire into the play; others read into it motives never intended. So contrary were the views, that Ibsen threatened to write an autobiographical interpretation of it. "Why cannot they read it as a poem?" he queried. That is the way it should be regarded. Even Ibsen used to confess that neither 'Brand' nor 'Peer Gynt' was intended by him for the stage. In 1874, however, he was arranging with Edvard Grieg for the music now so widely famous as the Grieg Peer Gynt Suite; but for the purposes of the music he was considering an adaptation of his original text. In 1906 scenes from the play were given by the Progressive Stage Society of New York; but to Richard Mansfield is due the credit for the authentic American performance of 'Peer Gynt,' at the Chicago Grand Opera House, 24 Oct. 1906. The stupendous task of preparation for a drama so dependent on its external scene for illusion undoubtedly added to the strain on the actor's health, resulting in his death the following summer. There are three supreme figures that stand as creative epitomes of the Stoic, the Fantastist and the Romanticist. These are Brand, Peer Gynt and Don Quixote. Ibsen's two plays will come into their true position long after 'A Doll's House' and 'Hedda Gabler' are dated and outworn.

MONTROSE J. MOSES.

PEER AND PEERAGE. The original sense of the word "Peer" was one of equal rank, qualities, endowments or character and it

is often used with this signification in English literature as far back as the time of Chaucer. It is also frequently used in the sense of companion, associate or fellow. In Great Britain peer signifies a nobleman; in France the term formerly signified those who had a seat in the upper house. The dignity and privileges of peers originated with the growth of the feudal system. In the feudal system the principle was developed that every association should take care of its own affairs, including the judicial decision of disputes among themselves and with their superiors; and it became an obligation as well as a privilege of the vassal to appear at the court of the immediate lord on days of state and of the administration of justice. In France, at the time of the revolution by which Hugh Capet ascended the throne in 987, there were but seven secular princes immediate vassals of the Crown. When the Duke of France became king there remained but six, to whom were added the archbishop of Rheims as spiritual primate of France, and the bishop of Laon, with the title of duke, those of Beauvais, Noyon and Chalons, with that of count; and at a later period, under Louis VII, also the bishop of Langres, because their dioceses were situated within the immediate domains of the Crown. The ancient principalities of peers were by degrees united with the crown; only the spiritual lords maintained their titles. Richelieu, backed by Louis XIV, reduced the privileges of the peerage practically to a question of precedence. The peers were still permitted to be judged by the higher courts and to sit in Parliament. The revolution of the 18th century abolished the French peerage, but Louis XVIII re-established it after the model of that of England by the charter of 1814. In 1831 hereditary peerages were abolished in France.

In England the peerage originated as in France. This dignity belongs to the five degrees of nobility (duke, marquis, earl, viscount and baron), by right, which was not the case with the French nobility, though the idea of *mésalliance* does not prevail by any means to the same extent in England as on the continent of Europe. In the beginning all the Crown vassals appeared at court on the days of state, and attended the diets; afterward only those who were summoned to appear by writ. This custom grew at length into a rule, and the summonses were considered proofs of hereditary peerage. There is one lordship—the borough of Arundel—which confers the dignity of earl on its possessor by prescription. In regard to all other titles the peerage is personal, and descends in a direct line from male to male. The chief privileges of peers are that of a seat in the House of Lords, of a trial by persons of noble birth in case of indictments for treason and felony, and misprison thereof, and of exemption from arrest.

The House of Peers (or Lords) of Great Britain consists of all peers of the United Kingdom; the representative Scottish peers elected for each Parliament; the Irish representative peers elected for life and the lords spiritual. Many of the peers of Scotland and Ireland are also peers of England, Great Britain or the United Kingdom and hold their seats in the House of Lords under one of

these titles. The peers of the United Kingdom are those of prior to 1707 and those of Great Britain from 1707 to 1 Jan. 1801. See PARLIAMENT.

PEERYBINGLE, pē'ri-bing-gl, Mrs., in Dickens' 'Cricket on the Hearth,' the wife of John Peerybingle, a carrier. She is a cheerful little woman, whom her husband calls 'Dot.' This pet name Dion Boucicault made the title of his dramatization of the story (1862).

PEET, Harvey Prindle, American educator: b. Bethlehem, Conn., 19 Nov. 1794; d. New York, 1 Jan. 1873. He was graduated at Yale in 1822, and in 1824 became superintendent of the American Asylum for the Education of the Deaf and Dumb at Hartford, the first institution of its kind in the United States. In 1831 he was appointed president of a like institution in New York which position he occupied until 1868 when he resigned. He found the supply of suitable books for use in his work decidedly insufficient and in 1844-46 published 'A Course of Instruction for the Deaf and Dumb' which came into general use. His other writings include 'Legal Rights of the Deaf and Dumb' (1856), and other works on deafness and insanity.

PEET, Stephen Denison, American archaeologist: b. Euclid, Ohio, 1830; d. 1914. In 1851 he was graduated at Beloit College and in 1851-53 was a student at the Yale Divinity School and in 1854 was graduated at Andover Theological Seminary. In the following 40 years he held pastorates in Wisconsin, Ohio and Illinois and in 1895 removed to Chicago. In 1878 he founded the *American Antiquarian and Oriental Journal*, which he edited until his death. His published works are 'The Clan Centres and the Clan Habitat of the Effigy Builders' (1891); 'The Mound Builders: Their Work and Relics' (1892; 2d ed., 1903); 'The History of the Explorations in the Mississippi Valley' (1896); 'Prehistoric America' (3 vols., 1890-99); 'Ancient Monuments and Ruined Cities' (1904); 'Myths and Symbols' (1905); 'Aboriginal Religions in America' (1905).

PEEWIT, a name applied in some parts of England to the lapwing plover (*Vanellus cristatus*); and similarly sometimes to the black-headed gull (*Larus ridibundus*). See GULLS; LAPWING.

PEFFER, William Alfred, American statesman, journalist and author: b. Cumberland County, Pa., 10 Sept. 1831; d. 1912. He was engaged in farming in Indiana and Missouri; but being forced to leave there on account of his open support of the Union, he went to Illinois in 1862 and enlisted in the Federal army, where he was promoted to the rank of first lieutenant, and served as adjutant, judge-advocate and quartermaster. Mustered out in 1865, he settled in Clarksville, Tenn., and began the practice of law. In 1870 he moved to Kansas, where he continued his law practice, and established the *Fredonia Journal and Coffeyville Journal*. In 1874 he was elected to the State senate, and was chairman of the legislative committee on the Centennial Exhibition in 1876. In 1880 he was a presidential elector on the Republican ticket, and in 1881 he became editor of the *Kansas Farmer*, in which he advocated government control of railroads, the free coinage of silver and reduction

of the rates of interest, and opposed national banks and monopolies. Through his advocacy of these measures he became one of the founders of the People's party, and in 1891 was made the president of the national conference of that party at Cincinnati. In 1890 he was elected to the United States Senate on the Populist ticket; during his term he was chairman of the committee on civil service, and was a member of the select committee on woman's suffrage. He maintained that the farmers ought to control the politics of the country. He subsequently allied himself with the Prohibition party and was their candidate for governor of Kansas in 1898. He has written 'Geraldine, or What May Happen' (1888); 'Peffer's Tariff Manual' (1888); 'The Way Out' (1890); 'The Farmer's Side' (1891); 'Americanism in the Philippines' (1900); 'Rise and Fall of Populism in the United States' (1900).

PEG WOFFINGTON, a novel by Charles Reade, published in 1852, and subsequently dramatized under the title 'Masks and Faces.' This delightful tale of 18th century manners opens in the green-room of Covent Garden Theatre, where the Irish actress, Margaret Woffington, in the heyday of her fame and beauty, tricks the entire dramatic company, including Colley Cibber, the famous playwright and comedian, by personating the great tragic actress, Mrs. Bracegirdle.

PEGASUS, (1) in Greek mythology, a winged horse, the offspring of Poseidon and Medusa, which sprang from the body of the latter when Perseus struck off her head. He was called Pegasus because he was supposed to have made his appearance near the sources of the ocean. Pegasus was caught at the spring Pirene, in Corinth, by Bellerophon who made use of him in his conflict with the Chimæra and in subsequent wars. He was believed to have flown up to heaven and to have taken his place among the stars. But he left behind him traces of his residence upon earth. One of these long existed in the shape of the Hippocrene spring on Mount Helicon, which was popularly believed to have been caused by a blow from Pegasus' hoof. The same story is told of several other fountains in Greece. The muses of Mount Helicon are represented as paying special honor to Pegasus for his gift. Pegasus, in later days, became the steed on which the poet is carried into the realms of poetic fancy. (2) In astronomy the Flying Horse, one of the 20 ancient northern constellations, bounded on the north by Lacerta and Andromeda, on the south by Aquarius, on the east by Pisces and on the west by Equuleus and Delphinus. It is on the meridian in September at midnight. Alpha Pegasi is Markab, Beta Pegasi is Scheat and Gamma Pegasi is Algenib. These with Alpha Andromedæ constitute the great square of Pegasus.

PEGGOTTY, pēg'ò-tī, in Dickens' 'David Copperfield,' a family name, belonging especially to Clara Peggotty, the faithful nurse of David, who always addresses her by that surname. The other members of the Peggotty family are Clara's brother Dan, a retired sailor, and her nephew Ham, a Yarmouth boatman. With Little Emily and Mrs. Gummidge they all live in an old barge which they have converted into a tolerable dwelling.

PEGMATITE, a very coarse granitic rock, composed essentially of lamellar feldspar and quartz, frequently with white mica and sometimes tourmaline and garnet. Pegmatite is distinguished by the irregularity of its texture, the larger crystals together in one part and the smaller in another. The quartz will often be found in segregated masses with the tourmaline or garnet. Syenitic pegmatite is almost wholly of alkali-feldspar. Pegmatite occurs usually as a dike traversing other forms of igneous and crystalline rocks. It is best known commercially from its use as a source of feldspar in the manufacture of porcelain.

PEGOUD, pē'goo', Adolphe, French aviator: b. about 1883; d. 1915. In 1913 Pegoud became famed for his flying feats. He was the first aviator to fly his plane upside down and to loop the loop in the air. At the outbreak of the war with Germany in 1914 he joined the aviation corps of the French army. He was awarded the military medal in March 1915, and in April 1915 shot down a German Taube making prisoners its pilot and observer. Pegoud was officially credited with the destruction of six German planes when he himself was downed by the foe.

PEGRAM, pē'grām, George Herndon, American civil engineer: b. Council Bluffs, Iowa, 29 Dec. 1855. In 1877 he was graduated at Washington University and became construction engineer of the Utah and Northern Railway; was principal assistant of C. Shaler, bridge engineer in 1878-80 and chief engineer of the Edge Moor Iron Company of Wilmington, Del., in 1880-86. In 1886-89 he was consulting engineer at New York; in 1889-93 consulting engineer of the Missouri Pacific system and from 1893 to 1898 chief engineer of the Union Pacific system. In 1898-1903 Mr. Pegram was chief engineer of the Manhattan Elevated Railroad and since 1903 has been chief engineer of the Interborough Rapid Transit Commission and after 1912 also of the New York Railways Company. Mr. Pegram designed the Kansas City Elevated Railroad and the Union Station at Saint Louis and designed and built combined highway and railway bridge across Arkansas River at Fort Smith, Ark. In 1917 he was president of the American Society of Civil Engineers.

PEGRAM, John, American soldier: b. Petersburg, Va., 24 Jan. 1832; d. Hatcher's Run, Va., 6 Feb. 1865. He was graduated from West Point in 1854, appointed to the First Dragoons and in 1857 was made first lieutenant. He was assistant instructor of cavalry and in 1857-58 accompanied the Utah Expedition. In 1860 he served against the Indians in Mexico and at the outbreak of the Civil War resigned his commission (10 May 1861) and entered the Confederate army, where he was appointed captain of cavalry. He was captured at Rich Mountain, and after his exchange was appointed chief of engineers under General Bragg in Mississippi, later becoming chief of staff to Gen. Kirby Smith in Tennessee. In 1862 he was commissioned brigadier-general of cavalry, was engaged at Murfreesboro and commanded a division at Chickamauga. He was promoted to major-general and given command of General Early's former division in the Army of Northern Virginia, fought in the battle of the

Wilderness and against Sheridan in the Shenandoah Valley in 1864. He was fatally wounded in the battle of Hatcher's Run, near Richmond.

PEGU, pē-goo', Lower Burma, (1) ancient Malay kingdom, dating back to the 6th century, when the city of Pegu was built, destroyed in the 18th century, but rebuilt and from 1754 to 1852 a dependency of Burma, and now under British control as (2) a division of Lower Burma, with an area of 13,257 square miles and population of about 1,850,000, including five states or districts, namely, Rangoon, Hanthawadi, Tharawadi, Prome, (3) Pegu, the largest district of the division, with an area of 4,276 square miles and a population of about 350,000, mostly Buddhists. Rice is the principal crop of the surrounding country. In the district is the famous temple of Gautama Schwema-da, which its priests say is more than 2,300 years old. Rangoon is the largest city. (4) Pegu, town formerly the capital of Lower Burma, on the Pegu River, 47 miles by rail northeast from Rangoon. It has a population of 17,000, and is the terminus of a railroad running through Sittang and Thaton to Martaban, opposite the port of Moulmein. The town is noted for its great pagodas, some of them in ruins, and for the colossal recumbent statue of Gautama, 181 feet in length and 46 feet high at the shoulder; and other colossal figures representing Buddha and his predecessors. (5) Pegu, a navigable river rising in the Pegu Yomas, a range of hills (2,000 feet) dividing the valleys of the Irrawadi and Sittang rivers. It runs a course of 175 miles, and empties into the Rangoon River just below the city of Rangoon.

PEHLEVĪ LANGUAGE AND LITERATURE. The word is also written Pahlavī, Pahlevī; etymologically from Parthian, Parthava, Pahlav. It is the name given by Zoroastrians to the ancient translations of the sacred scriptures of that creed. Firdūsi, the great poet, mentions that Pehlevī books furnished him with many of his narratives. Ibn Mokaffa, the learned Arabian, speaks of Pehlevī as an idiom of Persia. It was, however, as has now been established, less an idiom than a mingling of Arabic and ancient Persian, as it was employed during the Sassanide dynasty—Semitic (Aramaic) and Aryan (Zend) vocables being in an almost hopeless jumble, often Arab words with Persian endings, etc., and it is largely for this reason that many writers have reserved the term Pehlevī merely for that system of writing. To speak of this first, then, Pehlevī writing is a species of Arab adapted to Persian. The character of this mode of writing is cursive and very ambiguous, easily leading to misapprehension and misinterpretation. Thus, for the letters *n*, *u*, *r* there is but one character, and so there is but one for *y*, *d*, *g*. It was, to put it in another form, on the surface at least, an attempt to represent Persian consonantal and vowel sounds by Arabic signs, a manifest impossibility. That explains, too, the arbitrary manner of expressing the Persian sounds by this means.

But all this shows but the seeming facts. In reality Pehlevī was pure Persian, though disguised in the writing of it to appear a barbarous mixture of Arabic and Persian. Thus, some 400 or 500 Arabic words were in it written in Arabic characters, and when thus pro-

nounced certainly represented Arabic words. These words, however, comprised the stock of very common, everyday vocables, such as "house," "king," "horse," "food," etc. But the Persians in reality in reading them substituted for these words their own Iranian ones, making, for example, out of the Arabic "bisra" (meat) the purely Persian "gosht." This supply of words thus re-Persianized in the reading and the system of "camouflage" necessary to hoodwink the Arab conqueror was called "Huzvareh." Parallel cases, though not due to the same motive, suggest themselves in English. Thus, we read customarily such words as the Latin *id est*, i.e., as "that is," or the sterling, the *libra*, as "pound." Huzvareh itself meant, quite characteristically, "alteration," "disguise," "perversion." This disguised Persian (which for many years caused modern interpreters much difficulty) was, though, often transliterated into unadulterated Persian, Zend or Modern Persian, and the Semitic element being wholly removed. Such texts are usually spoken of as Pāzand (meaning "re-explanation") or Parsee. Pehlevi, though, was written and spoken in a form of Persian which had already far advanced on the way to becoming a purely analytical language, grammar and syntax being simplified and declensional and inflectional endings having largely disappeared.

The study of the Pehlevi language was stimulated in 1871 by the discovery of 52 Pehlevi writings in the library of a Parsee high-priest in Bombay. Since then many more inscriptions and manuscripts have been found, and doubtless others are moldering away in the collections of native literati or priests. What has so far been discovered refers in its contents to religious topics, texts on miscellaneous subjects and translations of ancient Zend Avesta texts. Of the Pehlevi literature of between 226 and 881 A.D., the Sassanian period, therefore, and the first two centuries of Arab dominion, there have been preserved nearly 100 works. Chiefly these are the Pehlevi version of the Avesta; the Bundahish, being a species of Iranian Genesis; the Dinkart, i.e., matters of religion; the Dādistān-i Dinik, religious discussions; the Mainog-i Khirad, doctrinal teaching; and the Arda-i Virāf Nāmak, a kind of Apocalypse. Of other Pehlevi literature nothing has been preserved, though indications and internal evidence point to the probability that there must have been quite a stock of it, historical works as well as fiction and lyrics, at the time when the Arabs, in 661 A.D., swept the Sassanide kings out of power. But even during the period of Arab power the Zoroastrian priests continued to write the old tongue as a dead language. The Mainog-i Khirad is especially useful to the student of Pehlevi in affording glimpses of the Pehlevi of the earliest period. The rock inscriptions of Ardashir made the great Sassanian ruler of that name the central figure. All these Huzvareh translations were themselves taken from mere fragments of the Avesta, only one book of which, the Vendidad, having come down to us complete, out of 21. From a philological point of view it is moreover of interest to note the gradual decay of grammatical forms in the slow process of development to which the Persian idiom was subjected and which is clearly noticeable not only

in Pehlevi and Modern Persian but even in Old Persian, as distinguished from Zend. The process was, in fact, almost identical in every respect with the process of evolution through which the Romance tongues went in changing from the original Latin tongue, and even from the *lingua rustica*. For comparative philology there is a fund of information to be derived from observing the facts.

Bibliography.—Andreas, F. C., 'The Book of the Mainyo-Khard in the Original Pehlevi' (Kiel 1882); Darmesteter, J., 'Le Pehlevi et le Parsi' (in *Etudes Iranieñnes*, I, 14-43 Paris 1883); Harlez, C. de, 'Avesta' (Paris 1881); Mills, I. H., 'Yasna, Visparad, etc.' (Oxford 1880-87); Müller, Fr., 'Beiträge zur Erklärung des Minöig Chrad' (Vienna 1892); Peshotan, B., 'The Dinkard' (Bombay 1874); Stolze, F., 'Persepolis' (2 vols., Berlin 1882).

WOLF VON SCHIERBRAND.

PEI-HO, pā-hō, the "North River," sometimes called PAI-HO, the "White River," the largest river of northeastern China, draining a watershed of 55,000 square miles; a river of North China, rising in the mountains on the Mongolian frontier of Manchuria, crossing the line of the Great Wall thrice, flowing tortuously to the southeast, receiving the Tung-hui 12 miles from the city of Peking, and joining the Sha-ho at Tung-shu, the port of Peking, where it becomes navigable for native boats. Near Tien-tsin the Hu-to-ho empties into the Pei-ho, and from here the river is navigable for small steamers. A little further down the Imperial Canal connects it with the Hoang-ho and the Yang-ste-kiang. The Pei-ho empties into the Gulf of Pe-chi-li, about 350 miles from its source. It is closed by ice from November to March. At its mouth is the fortified town of Taku (q.v.); near the embouchure the Chinese were defeated by the French and English 19 May 1858, repulsed the English 25 June 1859, and were again defeated, the forts being taken, 21 Aug. 1860, by the allies.

PEINE FORTE ET DURE, pān fört ā dūr, the name given in Europe to a kind of punishment formerly inflicted upon a prisoner charged with felony if he refused to answer on his indictment. In an indictment for high treason a prisoner who was obstinately mute was liable to receive judgment and execution the same as if he had been convicted. In the lowest felony, or petty larceny, standing mute was also held equivalent to conviction, and the prisoner received sentence and punishment accordingly. But in all other felonies the prisoner was required to plead before a conviction could be obtained, hence if he refused he was subjected to the *peine forte et dure*, "a judgment which was purposely ordained to be exquisitely severe, that by that very means it might rarely be put in execution." The judgment for standing mute was as follows: That the prisoner be remanded to the prison from whence he came and put into a low, dark chamber, and there be laid on his back on the bare floor, naked, unless where decency forbids; that there be placed upon his body as great a weight of iron as he can bear, and more; that he have no sustenance, save only, on the first day, three morsels of the worst bread; and on the second day three draughts of standing water, that should be nearest to the prison door; and in this situation this

should be alternately his daily diet till he answers. The penalty was abolished by George III. There are various cases on record of persons, including at least one female, who have died under the infliction of this penalty. The latest instance recorded of its administration is in 1741. It is said that only once was this penalty inflicted in America and that was in 1692, in the case of Giles Cory, charged with witchcraft, at Salem, Mass.

PEIPUS, *pipooos* (Russian, ТЧУДСКОЕ-ОЗЕРО, that is, "Lake of the Tchuds"), a great lake lying about 30 miles south of the Bay of Narva in the Gulf of Finland, and partly separating the republic of Esthonia from the Russian governments of Petrograd and Pskoff. It is about 48 miles long and 32 wide and covers an area of 1,020 square miles. It is joined by a broad and very deep passage (about 20 miles wide) to Lake Pskoff, which has an area of about 150 square miles. The entire lake system drains by the River Narova (45 miles) into the Gulf of Finland. The shores of Peipus are low and marshy, and in general heavily wooded, and the water very deep in places. There are several islands; Porka is the largest. Several rivers empty into this inland sea, on which there is a large volume of commerce carried on by steamers. Fishing is an important industry. A naval battle between the Russians and Swedes fought on this lake in 1702 was won by the former.

PEIRCE, *pêrs* or *pêrs*, **Benjamin**, American mathematician: b. Salem, Mass., 4 April 1809; d. Cambridge, Mass., 6 Oct. 1880. He was graduated from Harvard in 1829, was tutor there in 1831, and in 1833 was appointed professor of mathematics and natural philosophy. In 1842 he accepted the Perkins chair of mathematics and astronomy which he occupied until his death. Harvard gave him the degree of LL.D in 1867. He was consulting astronomer of the 'American Ephemeris and Nautical Almanac,' 1849-67; and superintendent of the United States Coast Survey, 1867-74, personally conducting the expedition to Sicily for the purpose of observing the eclipse of the sun in 1870 and organizing various important expeditions. He assisted in the organization of the Dudley Observatory at Albany in 1855, and through his efforts the observatory at Harvard was established. As an astronomer he made valuable investigations and discoveries and as a mathematician his work is of great importance. He was one of the founders of the American Academy of the Arts and Sciences; a member of the American Philosophical Society; and an associate member of the Royal Astronomical Society of London. He was also an honorary member of many foreign intellectual societies. He prepared a series of mathematical textbooks for use in the university which made many departures from the beaten path and which have had a highly beneficial effect upon methods of teaching. His astronomical and mathematical treatises are of great scientific value and include 'Analytic Mechanics' (1855); 'Linear Associative Algebra' (1870); 'Ideality in the Physical Sciences' (1881), etc. Consult King, 'Benjamin Peirce, a Memorial Collection' (1881).

PEIRCE, **Benjamin Osgood**, American educator: b. Beverly, Mass., 11 Feb. 1854; d.

14 Jan. 1914. After leaving school he learned the carpenter's trade but decided to go to college and entered Harvard, where he was graduated in 1876. Upon his graduation he was awarded a traveling fellowship, and went to Germany for four years, receiving in 1879 the degree of Ph.D. at the University of Leipzig. On his return to America Dr. Peirce specialized in mathematical physics. From 1881 to 1884 he was assistant instructor in mathematics at Harvard, later becoming assistant professor, and in 1888 was appointed to the Hollis chair of mathematics and natural philosophy there. He was a member of the National Academy of Sciences; the American Mathematical Society; the American Physical Society; and the Astronomical and Astrophysical Society of America; and was a Fellow of the American Academy of Arts and Sciences, and also of the American Philosophical Society. He has published 'Theory of the Newtonian Potential Function' (1899); 'Experiments in Magnetism,' etc.

PEIRCE, **Bradford Kinney**, American Methodist Episcopal clergyman: b. Royalton, Vt., 1819; d. 1889. In 1841 he was graduated at Wesleyan University and in 1846 became a member of the New England Conference. In 1844-45 he edited the *Sunday-School Messenger* and *Sunday-School Teacher*; in 1854-56 agent of the American Sunday School Union, and in 1855-56 State senator of Massachusetts. From 1856 to 1862 Mr. Peirce was superintendent and chaplain of the State Industrial School at Lancaster, Mass. Subsequently for 10 years he was chaplain of the house of refuge, Randall's Island, N. Y., and for about 16 years edited *Zions Herald*. He published 'The Bible Scholar's Manual' (1847); 'Notes on the Acts' (1848); 'The Eminent Dead' (1851); 'Question Books for Sunday-School Scholars' (1849-52); 'Trials of an Inventor' (1866); 'The Word of God Opened' (1868); 'A Half Century with Juvenile Delinquents' (1869).

PEIRCE, **Charles Santiago Sanders**, American logician and psychologist, son of the great mathematician, Benjamin Peirce (q.v.): b. Cambridge, Mass., 10 Sept. 1839; d. at his home at Milford, Pa., 14 April 1914. He was graduated from Harvard in 1859. He published 'Photometric Researches' (1878); and edited, with many additions, 'Studies in Logic' by several members of Johns Hopkins University. He was the first to call attention (1878) to the principle of "pragmatism," and the author of that title. For many years he was connected with the Geodetic Survey as physicist and mathematician. He wrote many memoirs and articles upon logic, psychology, metaphysics, mathematics, astronomy, optics, chemistry, engineering and other scientific subjects covering an exceedingly wide range. He also contributed largely to the 'Century Dictionary' and Baldwin's 'Dictionary of Psychology and Philosophy' (1901).

PEIRCE, **George James**, American botanist: b. Manila, Philippine Islands, 13 March 1868. In 1890 he was graduated at the Lawrence Scientific School of Harvard and subsequently studied at the universities of Bonn, Leipzig and Munich. In 1895-97 he was assistant professor of botany at Indiana University, in 1897-1900

assistant professor of botany, in 1900-10 associate professor, and since 1910 professor at Leland Stanford Jr. University. In 1909-10 he was collaborator in the United States Forest Service and in 1910-11 was special agent of the Department of Justice, studying the effects of smoke on vegetation. Peirce is a fellow of the American Association for the Advancement of Science and has published 'Textbook of Plant Physiology' (1903).

PEIRCE, James Mills, American mathematician: b. Cambridge, Mass., 1834; d. 1906. In 1853 he was graduated at Harvard, where he was appointed assistant professor of mathematics in 1861 and professor in 1869. He became Perkins professor in 1885. From 1890 to 1895 he served as dean of the graduate school and from 1895 to 1898 of the faculty of arts and sciences. He published 'Textbook of Analytic Geometry' (1857); 'Three and Four Place Tables of Logarithmic and Trigonometric Functions' (1871); 'The Elements of Logarithms' (1874); 'Mathematical Tables, chiefly to Four Figures' (1879).

PEIXOTO, pã-shō'too, Floriano, Brazilian soldier and second President of the Republic of Brazil: b. Pico, province of Alagoas, Brazil, 30 April 1842; d. Rio Janeiro, Brazil, 29 June 1895. He entered the army as a private, rose rapidly, gained high honors in the war with Paraguay in 1865-70, and afterward resigned to oversee his estate. The abolition of slavery greatly affected his fortunes and in 1889 he rejoined the army, assisted da Fonseca to overthrow the empire, and was elected a senator of the new republic. He acted as first Minister of Finance, was Vice-President in 1891, and succeeded da Fonseca as President in that year. In the civil war which ensued he firmly upheld the constitution and, though unpopular with the army, crushed the navy uprising under Admirals De Mello and Da Gama, and the second insurrection (1893) in Rio Grande do Sul, and successfully completed his term. Being defeated in the following election by Dr. Moraes, in 1894 he peacefully resigned the office. Consult Luiz José Pereira da Silva, 'Floriano Peixoto' (Rio Janeiro 1894). See BRAZIL.

PEIXOTO, Ignacio José de Alvarenga, Brazilian jurist and poet: b. Rio Janeiro, 1748; d. Ambaca, Angola, Africa, 22 May 1792. He was graduated from the University of Coimbra, Portugal, as a bachelor of divinity; and received the appointment of judge of Cintra. He returned to Brazil in 1776 and was there appointed judge of the district of Rio das Mortes. As a devoted follower of Paula Freire de Andrade he was implicated in a revolutionary uprising, arrested, imprisoned for two years without trial on the island of Cobras, and on 18 April 1792 was condemned to death. The sentence was commuted to transportation for life and he died a few months later in the penal colony at Ambaca, Africa. His poems, which take high rank in Portuguese literature, were collected and published in Paris, 'Obras poeticas collegidas annotadas, precedidas de Juizos criticos' (1866).

PEIXOTTO, pìks-öt'ō, Benjamin Franklin, American diplomat, lawyer and journalist: b. New York, 13 Nov. 1834; d. there, 18 Sept. 1890. Receiving his earliest training in New

York, he settled in Cleveland after his father's death, in 1847, studying law for a time under Stephen A. Douglas (q.v.). In 1863 he was chosen head of the Order of Benai Berith, the leading Jewish fraternity, whose membership he rapidly trebled. He advocated an American Jewish University which was not favored at the time, but his suggestion to establish an orphan asylum at Cleveland was adopted. In 1867 he removed to San Francisco where he engaged in the practice of law. In June 1870, when the Rumanian persecution of the Jews reached alarming proportions, he was appointed Consul-General to Bucharest by President Grant, where he succeeded in arresting disorder, with the co-operation of Secretary Hamilton Fish and the active sympathy of the European powers whose representatives in Rumania joined with Peixotto in his work of enlightenment. In addition, he did much educational work among the Rumanian Jews. In 1876 he returned to the United States and was tendered by President Hayes the post of Consul-General at Saint Petersburg, which he declined, accepting, however, the consulship at Lyons, France. In 1885 he returned to New York, resumed the practice of law, established a monthly magazine under the title *The Menorah*, and was prominent in social, educational and charitable work.

PEIXOTTO, Daniel Levy Maduro, American physician: b. in Amsterdam, Holland, 18 July 1800; d. in New York, 13 May 1843. At an early age he came to New York with his parents, his father, Moses L. M. Peixotto, becoming minister of a Jewish congregation. He was graduated from Columbia in 1816 and entering the office of Dr. David Hosack received his M.D. degree in 1819. For a few years he occupied himself with travel, returning to New York in 1823, where he entered upon the practice of his profession, in which he rose to eminence. He became in 1825-26 one of the editors of the New York *Medical and Physical Journal* and *Gregory's Practice*. He was president of the New York County Medical Society 1830-32. In 1836 he was called to the presidency of the Willoughby Medical College, Cleveland, Ohio, and remained there several years. He was an active participant in public charitable work and especially in forwarding Jewish educational movements.

PEIXOTTO, Ernest Clifford, artist and author: b. San Francisco, Cal., 15 Oct. 1869. He began his art studies at the School of Design in San Francisco, and in 1888 went to Paris to continue them at the Académie Julian. In 1890 he exhibited a peasant interior at the Salon and in 1891 a church interior, the latter subsequently exhibited at the Society of American Artists in New York. He returned to San Francisco in 1891. He received honorable mention for some drawings exhibited at the World's Fair, Chicago, 1893, and in that year he returned to France for further study. At the Salon of 1895 he was awarded honorable mention for a picture entitled 'A Woman of Rijsoord,' a study of a Dutch woman's head in the quaint coif of the environs of Rotterdam. Returning to San Francisco again, he painted several portraits and had two successful exhibitions. He added to his fame at this period by his artistic illustration in Gellett Burgess' 'Lark,' an airy San Francisco publication. He

designed most of its covers and made many of its illustrations. In 1897 Mr. Peixotto settled in New York City, and busied himself illustrating for the leading magazines. He illustrated Brun's 'Tales of Languedoc,' Henry Cabot Lodge's 'History of the Revolution,' Theodore Roosevelt's 'Cromwell' and Mrs. Wharton's 'Italian Backgrounds.' As an illustrator his work has taken high rank; its characteristics are simplicity and directness, picturesqueness and vividness of detail. He has always had a fondness for architectural studies, and abroad he made many sketches of the châteaux in the valley of the Loire and of the French cathedrals, while at home his drawings of the Congressional Library in Washington and Boston Public Library are perhaps the best of that class. In 1899 when he again went to Europe he began writing articles to accompany his illustrations of the picturesque out-of-the-way places on the Continent, and since 1906 he has confined his illustrations to his own publications. His first book was 'By Italian Seas' (1906), dealing with Mediterranean material and containing 80 illustrations by himself, followed by 'Through the French Provinces' (1909), with 85 illustrations. In 1906-07 there were two exhibitions in New York of his paintings of old world garden subjects. By special request his drawings and paintings were exhibited in 1907-08 at the Art Institute, Chicago, the Toledo Museum of Art and the Detroit Museum of Art. In 1909 he was made an associate of the National Academy. He then painted a large frieze of panels whose subjects were drawn from the 'Morte d'Arthur' for a library near Cleveland. For this work he was made a member of the National Society of Mural Painters, also of the Architectural League. His pictures have found places in notable private and public collections. His later works are 'Romantic California' (1911); 'Pacific Shores from Panama' (1913); 'Our Hispanic Southwest' (1916).

PEIXOTTO, George Da. M., American portrait and mural painter: b. Cleveland, Ohio, February 1859. He was a son of B. F. Peixotto (q.v.) and on his father's appointment to the Rumanian consulate, he studied at the Dresden Royal Academy of Fine Arts, where he was graduated in 1877, receiving the silver medal. He then went to the Julian Academy in Paris for further study and was also a pupil of Meissonier as well as Munkacsy. His portraits of Cardinal Manning and Sir Moses Montefiore began to arouse attention, and were followed by paintings of Father Sylvester Malone, Chief Justice M. R. Waite, Bishop Gilmore, Chancellor Eliot of Saint Louis and many others. Mr. Corcoran purchased the portrait of Montefiore for his art gallery at Washington. The New Amsterdam Theatre in New York has some of his mural decorative paintings. Mr. Peixotto has contributed to the Paris Salons since 1882.

PEKAN. See FISHER.

PEKIN, pē'kin, Ill., city, county-seat of Tazewell County; on the Illinois River and on the Illinois Central, the Chicago, Peoria and Saint Louis, the Cleveland, Cincinnati, Chicago and Saint Louis, the Atchison, Topeka and Santa Fé, and the Chicago and Alton railroads, about 10 miles south of Peoria. It has

steamboat connection with ports on the Illinois River. It was settled in 1824, became a village in 1829, and in 1849 was incorporated as a city. It is in a productive agricultural section in which wheat and corn are the chief products. In the vicinity are coal deposits. The chief manufactures are ammonia, alcohol, beet sugar, glucose, agricultural implements, wagons, carriages, lumber and lumber products, foundry products, fertilizers, brick, tile, organs and furniture. It has an extensive trade in corn and considerable trade in grain, coal and its manufactured goods. There are good public and parish schools, a free library, a beautiful city park, municipal street railway, new \$100,000 high school, new \$300,000 county courthouse. The city adopted the commission form of government in 1911. Pop. (1920) 12,086.

PEKIN DUCK, the largest of the white ducks, weighing in some cases 10 to 12 pounds. It was introduced into the United States from China in 1873. It is hardy, feathers early and grows rapidly. As a market duck it cannot be excelled. It is also profitable as an egg-layer. The bill and feet are yellow or orange, the body long and meaty, the breast has a deep keel, and the flesh an excellent flavor. Ducklings are ready for market in 10 to 12 weeks from hatching.

PEKING, pē-king', or PEKIN, pē-kin' (*Pe*, north; *King*, height), the capital of the Chinese republic, in the province of Chi-Li, situated on the Great Northern Plain of China between the rivers Pei-ho and Hoen-ho; lat. 39° 54' 13" N.; long. 116° 28' E. Its population numbers about 700,000. It is about 40 miles from the great wall, 100 miles from the Gulf of Pe-chi-li, and since 1897 has been connected by rail with Tientsin, about 80 miles to the southeast. The entire circuit of the walls and suburbs is reckoned at 21 miles. The wall of the northern section or Tartar City is 50 feet high and 40 feet wide at the top; that of the southern section or Chinese City is 30 feet high and 25 feet thick at the base, diminishing to 12 feet at the top. They are faced nearly throughout with large bricks, laid in a mortar of lime and clay, which, in time, becomes almost as durable as stone. Square towers, projecting 50 feet from the outer side of the walls, occur at intervals of about 60 yards, and the whole is surrounded by a ditch. There are six gates leading from the outer world into the northern city and seven gates into the southern city. Through the wall between the two cities are three gates.

The northern or Tartar City, called Nui-Ching, was built first and the southern, called Wai-Ching, was added later. The former is built in the shape of a parallelogram, the walls facing the four cardinal points of the compass, and consists of three enclosures, one within the other, each surrounded by its own wall. The innermost enclosure or area is called Kin-Ching (prohibited or forbidden city), and contains the imperial palace and buildings connected with it, in which the emperor and royal family formerly resided. It is about two miles in circumference, is surrounded by a solid wall faced with purplish glazed bricks, and roofed with yellow tiles. Within are wonderful gardens, the lakes, the 'Island of Everlasting Flowers,' and the famous marble bridge.

Within the outer entrance, the "Gate of Celestial Peace," is the Temple of Imperial Ancestors in a park of fir trees. The inner entrance or "Nobody's Gate" opens into the famous Audience Halls. Within the inner enclosure is the Palace of Celestial Beauty. The second enclosure is of an oblong shape, about six miles in circuit, surrounded by a wall about 20 feet high. It was originally intended for the officers of the court, but is now occupied by Chinese merchants and tradesmen. One of the striking features of the second enclosure, or "Imperial City," is the terraced artificial mound, 215 feet high, standing close against the northern wall of the "Forbidden City." It is known as "Coal Hill," and is now covered with trees. This section also includes the government university and the Northern Cathedral. The third and outermost enclosure comprises the open city, which presents all the evidences of an industrious people intent on the pursuit of gain, mercantile bustle pervading every corner of it. Many of the principal streets are spacious, being more than 100 feet wide. They have been much improved in recent years, being now well drained by deep gutters and metaled in the centre, and kept sprinkled in dry weather. The side streets, however, are, as formerly, foul-smelling beds of mire in the rainy season, and banks of noisome dust when dry. The Legation Quarter which lies along the south wall of the Tartar City is quite modern in its appointments. It is surrounded on the north, east and west by a rampart, and within it are the official residences of the Ambassadors of the United States, Austria-Hungary, Belgium, Great Britain, France, Germany, Holland, Italy, Japan, Russia and Spain. Among the principal public buildings besides those already mentioned are the new (1911) Parliament Building, the Temple of Eternal Peace, belonging to the Llamas, and said to be the largest and most splendid temple in Peking; the Mohammedan mosque; the observatory; the church of Heaven's Lord, with a convent attached to it, considered one of the finest specimens of architecture in the city, but now going to decay. There are also edifices dedicated to several other forms of religion; among these are the Greek and Roman churches, Moslem mosques, Buddhist temples, besides temples dedicated to Confucius and other deified mortals. Among other institutions is the national college, Han-lin-yuen, where all Chinese learning and literature are concentrated, also Manchu, Chinese and Russian; all religions, though some of them are proscribed, share the honor of being sanctioned within its precincts. The chief religions recognized are Confucianism, Taoism and Buddhism. The other learned and scientific institutions of note are the medical college, astronomical board and the imperial observatory. In the northern part of the Tartar City is also the Ketteler Memorial; the Temple of Great Buddha with its wooden statue 78 feet in height; the Temple of Confucius; the Hall of Classics; the Drum Tower; and the Bell Tower with its gigantic bell weighing more than 40 tons. In the Southern City the principal public buildings are the Temple of Heaven and the Temple of Agriculture, both Confucian. In the southwestern section is a noted Buddhist temple. Outside of the walls there are many temples and tombs. The Tem-

ple of Celestial Peace is one of these. It was built in the 7th century. To the west of the city is the Taoistic Temple of the White Cloud and to the east the Taoistic Temple of the Eastern Peak, both notable. The old and new Summer Palaces are several miles to the east. Peking is sustained solely by its being the seat of government, having no trade except that which is produced by the wants of its vast population. There are no manufactories of any importance, beyond those necessary for making articles of luxury for the resident aristocracy and gentry. The principal part of the provisions required comes from the southern provinces or from the flocks reared in the northern part of Chi-Li, the adjacent plain producing but a small amount of the food demanded. A considerable portion of the taxes levied upon the productions of the whole empire is paid in kind, and is here stored up; the amount of rice alone in these granaries at one time of the year is enormous; but they are often empty before the new crop is gathered, so that a great many die for want of food.

According to the terms of the Treaty of Tientsin (1858) English and French ministers are allowed to reside at the Chinese capital, and subsequently the same privilege was granted to America and some other nations. Foreigners generally are also allowed to visit the city, but they must be provided with a passport from the ambassador or consul of the nation to which they belong, and on no account is any individual allowed to carry on trade. Previous to the ratification of that treaty, Russia was the only foreign power privileged to have a resident embassy. Besides the old established Roman Catholic missions there are six other Christian missions — four British, one American and one Russian. The Pekingese have more of the Tartar element among them than the inhabitants of any of the more southern cities of China; still the Chinese predominate, and they are gradually superseding their fellow-subjects by their greater industry and wealth. Even the old Tartar Banner corps is being dispersed.

Peking is more healthful than the more southern cities, although the range of temperature is much greater. This arises from the comparative dryness of the site, so that, although the thermometer falls to 4° below zero in the winter, and rises to 104° in the shade in summer, less inconvenience is felt than in Shanghai, where intense humidity prevails at a lesser range. The rainy season is in July and August. In the spring the city is swept by clouds of sand and dust. October is the pleasantest month in the year at Peking. A rude system of drainage intersects the city, but not sufficient to carry off the effluvia of the sewage, which even pervades the dust in summer. Attempts at modern sanitation have been made since 1900, but the progress is slow. The water supply is abundant, and a very complete fire brigade uses it to advantage in quenching the frequent conflagrations that take place. These and other matters are under the management of a governor of the city, irrespective of the central administration, which holds its offices in the imperial quarter of the Tartar section.

Peking is regarded by the Chinese as one of their most ancient cities, dating in Chinese his-

tory from 1121 B.C. In 936 A.D. it was captured by the Tartars of the North who destroyed the old city and built a new one. Part of its north wall still remains. In 1151 the Chinese took the city and greatly enlarged it. It was besieged in 1215 and taken by the Mongols, led by Genghis Khan, when the inhabitants for want of ammunition, are said to have discharged ingots of gold and silver on their assailants. Kublai Khan rebuilt it, and made it his capital in 1260. The Mongol dynasty, founded by Kublai Khan, continued to occupy this city till it was expelled from China, in 1367, by Hung-wu, the founder of the Ming dynasty. The name Peking was given to the city in 1409 by the second emperor of the Ming dynasty, who replaced its earth ramparts with brick walls. In 1421, the third emperor of the Chinese dynasty of Ming transferred his residence thither from Nankin, since which it has been the capital of the empire. In 1543 the new wall was built to include the southerly section which had grown up outside of the wall of the Tartar City, and which became known as the Chinese City, after 1644, when the Manchus took possession of the northern city expelling most of the Chinese to the southern section. It surrendered to the allied armies of France and England in 1860, on which occasion the Yueng-ming, or summer palace of the emperor, situated in the vicinity of the city, was destroyed. It was at this period that the various foreign legations were established. During the "Boxer" uprising of 1900 the foreigners in Peking were besieged in the legation section. For weeks they were given up as lost, but they managed to hold out till the arrival of the foreign troops. Since the fall of the Manchu dynasty and the establishment of the republic in February 1912, the class distinctions between the several "cities" have largely disappeared and the people of the several castes intermingle in all parts of the city. Besides the "gateway" smashed through the wall at the time of the siege, another gate has been opened to accommodate traffic, and still another is projected. The railway which formerly was halted at a distance from the city walls has now been brought into the city and a station built near the Gate of Celestial Peace. Two other railways are making progress from Peking over the Great Plain, opening new sections from which the city which produces none of its own supplies may receive the necessities of life. The "Purple City," however, still remains closed to visitors except after much official ceremony. See BOXERS; CHINA; PEKING, THE SIEGE IN.

PEKING, The Siege in. The siege in Peking in 1900 was the outgrowth of the Boxer uprising. The latter was a secret society formed at first, for the suppression of lawlessness, under the title of the "Society of the Harmonious Fists," which name was Anglicized into "Boxer." This aim was altered later and the Boxers banded themselves together anew for the extermination of foreigners and the prevention of foreign intercourse with China. In 1898 the empress dowager, Tse Hi, by a *coup d'état* made herself the ruling power, holding the young reform emperor, Kwang Hsü, a semi-prisoner. The Dowager represented the reactionary forces of the Empire. The rise of the Boxers against foreigners in 1899-1900 received

the encouragement of the Empress Dowager and her coterie who opposed the reforms of Kwang Hsü.

The Boxer movement was not a great anti-religious uprising, nor was it an anti-missionary crusade. It was distinctly anti-foreign, and this, irrespective of race, color, religion or nationality. The Boxers murdered European merchants, killed foreign engineers, massacred British and American missionaries, one and all, for the same reason, namely, that they were foreigners. Native Christians fell under their ban and were put to death by thousands because they were representatives of the new forces that had instituted the reforms of the young Emperor. The feeling against anything and everything foreign ran so high in the city of Peking that native shops were destroyed for selling American cottons or Japanese lamps.

All this time the rumor was spreading that the Empress was lending her aid to the Boxers in the hope that, instituting a reign of terror, all foreigners might be driven out of China. Many Chinese saw in this only disaster to the government, but even members of the Tsung Li Yamen (Foreign Office) were put to death when they opposed this insane policy of exterminating foreigners. This fact, together with documents found in Peking, shows beyond question the complicity of the Chinese government in bombarding the legations. In May 1900 seven of the 11 legations, fearing mob violence, secured from their respective navies detachments of sailors and marines as legation guards. This force reached Peking 31 May. It was less than 500, but in addition, there were probably 450 foreigners in Peking. By June the anti-foreign element was in possession of both the executive and military arms of the Empire. The end of the first week found a critical state of affairs in Peking. The telegraph had been cut, the railroad to the port city of Tientsin had been rendered useless, and all foreigners in and near Peking had fled from their homes and banded together in several places for self-protection. During this time dangers thickened, foreign property was looted and burned, while thousands of native Christians and foreign sympathizers fell by the sword. Matters reached a crisis on the 19th of June when the Chinese government sent word to the legations that all the foreign diplomats and their attachés should leave Peking within 24 hours. This was the beginning of the siege proper. The morning of the 20th, Baron Von Kettler, the German Minister, while on his way to the foreign office to expostulate against this treatment of the representatives of friendly powers, was shot down on the streets of Peking by Imperial soldiers.

Upon the news of the murder of Baron Von Kettler, the other ministers and their nationals who were preparing to leave the city decided that it would be impossible to make a journey of nearly 100 miles through hostile territory infested by bands of Boxers, bandits and Chinese troops. Certain massacre would have followed had the foreigners left the walls of Peking and exposed themselves to the attacks of the Chinese in the open country. Rather than take such a perilous journey, fearing the fate of Baron Von Kettler, the foreigners massed together in the British Legation, and

the legations immediately surrounding it, and decided to try to hold out until relief should arrive. Fortunately, the legations in Peking, after Oriental style, were surrounded by strong walls. Withdrawing within this enclosure, supplying themselves with what food they could procure, they fought only on the defensive. Three thousand native Christians went into siege with this handful of foreigners. In round numbers, there were 900 foreigners, including marines, in the legations. Of these, 228 were women and children. In addition, there were the 3,000 native Christians. Besides those in the legations, 41 marines, 13 French fathers, 20 sisters and 3,200 natives were besieged in the North Cathedral. The foresight of Bishop Favier had laid in food for his refugees. Sir Claude McDonald, British Minister, was commander-in-chief of the legation forces. This little band for 56 days held at bay an unknown multitude of Chinese soldiers. Firing was almost continuous upon the legations for 28 days when a semi-truce followed until about four days before the relief forces arrived. The first effort of the Chinese was to set fire to the legations. Dangerous conflagrations were fought day and night until the legations themselves stood in the midst of charred ruins. The great Hanlin Library was fired by the Chinese in an effort to burn the British legation. The besieged had only, besides their rifles, one cannon throwing a one-pound shell, a Nordenfeldt, a faulty Austrian machine gun, a small one-barrel Colt machine gun, and an old English muzzle-loading cannon of 1860.

As many as 400 shells and solid balls were thrown at the legations in a single day. Forty-three days of the siege were marked with the hail of bullets and the crash of shells. The Chinese soldiers indulged by night in furious attacks of rifle fire. Major Conger, the American Minister, said that never had he heard during the Civil War a half hour of such fusillades of firing as these night attacks. Only the bad marksmanship of the assailants prevented the annihilation of the besieged. Yet every hour witnessed miraculous escapes. From the beginning the siege was well organized. In addition to the military, there were the following committees: (1) general management, (2) fortifications, (3) food supply, (4) labor, (5) fire, (6) confiscated goods, (7) care of the horses, (8) sanitary and hospital. Constant effort was made by native messengers to reach the port with news. Out of 20 messengers dispatched, 17 were killed—three reached Tientsin. The besieged subsisted on rice, wheat, horses and mules. The truce fortunately gave opportunity for replenishing the food supply, in which labors the Japanese soldiers proved themselves most resourceful. The native besieged had by that time become so reduced in rations that they ate dogs. Fortunately the wells of water held out. The heat was often great. Smallpox, scarlet fever, diphtheria and dysentery especially, broke out in the native camp, but were held in check. Only one foreign infant out of seven survived. Marines and civilians vied with each other in the display of bravery. The mortality among officers was large. Captain Thomann (Austrian), Captain Ando (Japanese), Captain Strouts (British), Captain La Bruce (French), Lieutenant Henry (French), Lieutenant Paolini (Italian), were killed. Two

British, two American, three Austrian, one Russian, one French and two Italian officers were wounded. The Belgian and American captain-surgeons were wounded and the Japanese surgeon was killed. Among the defenders who took part in the actual fighting more than 50 per cent were killed or wounded. At the cathedral 400 natives and foreigners were killed. The American marines held a perilous position on the city wall, reinforced by British and Russians. Seventeen languages were represented among the besieged.

The Siege of Peking is without a parallel in history. Never before were the representatives of a friendly power brought to such straits by a nation to whom they had been accredited. Diplomats, missionaries, merchants, business men, teachers in the schools, and even an Englishman who was in the capital as a guest of the Chinese government, were penned up in a state of siege and were saved only by the valor of a handful of marines and the personal bravery of some of their own number. Most of the French, the Austrian, Italian, Dutch and Belgian legations were entirely destroyed. All the others, while held, were almost demolished by the terrific bombardment. On 10 June an effort had been made at Tientsin by 2,000 internationals under Admiral Seymour (British) and Captain McCalla (United States) to reach Peking. After getting half way and enduring terrible hardships this force had to retreat to Tientsin. The latter place itself was shelled for 30 days. On 4 August about 20,000 allies under Generals Gaselee (British), Chaffee (United States), Fukushima (Japanese), Liniévitch and Vassielevsky (Russian) and Frey (French) left Tientsin and after a terrible march of 10 days reached Peking. Every mile of the way they drove the Chinese forces before them.

The allies attacked the city early the morning of the 14th and the same afternoon at four o'clock, a detachment of Sikhs and Bengal Rajput Infantry under Gaselee and Americans under Chaffee reached the Legations. These were soon followed by the other nationals. A thanksgiving service marked the close of the siege. The *Te Deum Laudamus* was read by the chaplain of the British Legation. At 9 o'clock on the evening of the 14th, the Empress Dowager and the young Emperor with their suites and many of the troops fled by the northern gate of the Tartar City to the mountain fastnesses, 80 miles away. In the confusion the soldiers of the many nations gathered immense quantities of loot which was afterward "sold" at public auctions authorized by the foreign ministers, as the easiest method of settlement.

The siege in Peking adds one more chapter to the conflict between the East and the West. Many of the underlying causes will ever remain obscure. The siege represented what is to be hoped is the final effort of the old China to crush the rising influences of the new. The patience and faith of the women were exemplified under circumstances few have ever had to endure. That the foreigners besieged should ever have escaped is one of the miracles of history. It shows what a small band of men driven to bay can do with few resources and against overwhelming odds.

P., 'Indiscreet Letters from Peking' (New York 1911).

PELADAN, pā-lā-dān, **Joséphin** ("Le SAR"), French romancer and mystical writer; b. Lyons 1858. He became an eccentric and mystic, took the title of "Sar" (chief), posing as a descendant of the last Babylonian kings, and went about in theatric costume. Among his writings are 'Rembrandt' (1881); 'Introduction à l'histoire des peintures' (1884), and a romantic cyclus 'Decadence Latine' (1886-91), a mixture of astrology, mysticism and esotericism, which includes 'Le vice suprême' (1886); 'Curieuse' (1886); 'L'initiation sentimentale' (1887); 'A cœur perdu' (1888); 'Istar' (1888); 'La victoire du mari' (1889); 'Cœur en peine' (1890); 'L'Androgyne' (1890); and 'Le Gynandre' (1891). Apart from this cyclus are 'Femmes honnêtes' (1885); and 'La décadence esthétique' (1888). He was the founder, in 1892, of the order of La Rose Croix, or Croix du Temple, which, similar to the English pre-Raphaelite movement several years before, was in reality a reaction against the material side of French art. The cult had great vogue for several years, as the Geste Esthétique salons were held by the Rosicrucians, which promulgated his views and gave lectures and plays written by the Sar Peladan.

PELAGIANISM, pē-lā'ji-an-ism, a doctrine in regard to original sin taught by Pelagius, sometimes called Pelagius Brito, a Welsh monk of the latter end of the 4th and beginning of the 5th century, and regarded by the Church after much controversy as a heresy. His name, Morgan, was Latinized into *Marigena* (seaborn), and rendered into Greek as Pelagius (from *pelagos*, sea). He was in Rome about the year 400. He is thought to have imbibed his opinions from the monk, Rufinus, a follower of Origen. Pelagius was a contemporary of Augustine, who was influenced by his opposition to Pelagianism in expounding his own views on the subject. According to Pelagius, Adam was created mortal and would have died had he not sinned; and that his sin was not transmitted to his posterity; that it was possible for man to live altogether without sin; and that grace, that is, the divine aid, was not necessary or even possible to the human will. It was held that the will was free only when influenced neither toward good nor toward evil. Sin then becomes an act and has no existence apart from the act. The act does not change the nature of man, but only exposes him to the penalty. The argument was, therefore, that man was endowed with original perfection, not tainted by original sin. The Pelagians generally affirmed that every child was born in the same state of innocence as Adam was, and that his perseverance in virtue depended upon himself; original sin was an impossibility, since sin was the result of a depraved volition, not an infirmity of nature. A *peccatum naturale*, as they called it, was a confusion of terms, and a contradiction; infant baptism was administered to sanctify and admit children to the kingdom of

Heaven, not to remove the stain of sin, because infants had none; unbaptized infants dying in infancy have eternal life; and men may attain Heaven through a righteous life, that is, by keeping the law, as well as through the Gospel, some men having lived without sin while others may. Augustine, opposing these views, maintained that Adam's sin affected the human race, involving all mankind in guilt; physical death is the penalty of sin; infants are baptized for the remission of original or inherited sin, and Jesus Christ was the only sinless man who has appeared upon the earth. Among the Eastern synods the opinions of Pelagius were confirmed as orthodox and Pelagius was advised to anathematize those who opposed him "not as heretics but as fools."

Between 412 and 431 A.D. 24 councils were held to condemn the Pelagian doctrine. In 416 a synod of western bishops presided over by Augustine declared the Pelagian doctrines heretical. In 418 the civil authorities joined the ecclesiastics in denouncing them. The pope confirmed the sentence of the Third General Council at Ephesus (431) and anathematized the Pelagians. Pelagius was expelled from Jerusalem (421) and found refuge with Nestorius at Constantinople. According to tradition his death occurred in Palestine at the age of about 70 years. Among his writings are works 'On the Trinity'; 'On Free Will'; a 'Commentary on Paul's Epistles' (excepting Hebrews), supposed to exist in an expurgated form among Jerome's works; 'Eulogiæ', a collection of Scriptural extracts for use as an aid to Christian living; the creed which he submitted to Bishop Zosimus, a letter to Demetrius on asceticism; and various fragments. See ORIGINAL SIN; AUGUSTINE, SAINT.

PELAGIANS. See RELIGIOUS SECTS.

PELAGIC. See TERRIGENOUS.

PELAGIC ANIMALS, animals whose life is spent in mid-ocean, either near the surface or at various depths. Some, as the pelagic birds (albatrosses, petrels and the like), may come to shore to make their nests; but many forms are to be found nowhere except in the open sea. They comprise many of the lower forms of animal life, the radiates and mollusks particularly, many of the crustacea and large numbers of fish including some of the sharks and dolphins. The mammals also are represented by the whales. See DEEP-SEA EXPLORATION; GLOBIGERINA; OOZE; PLANKTON, etc.

PELAGIC SEALING, a term applied to the taking or capturing of seals in the open sea, that is, beyond the three-mile limit. According to the Paris award of 1893, pelagic sealing within a zone of 60 miles of the Pribiloff Islands was forbidden. In 1911, in response to an invitation of the United States, representatives of Great Britain, Russia and Japan met with those of the United States in the International Fur Seal Conference. An agreement was reached that for 15 years no pelagic sealing in Bering Sea should be permitted. This regulation went into effect on 15 Dec. 1911. The agreement was made to apply also to the capture of the sea otter. See BERING SEA CONTROVERSY; FUR TRADE, THE.

PELAGIUS I, pē-lā'jī-ūs, pope: b. Rome; d. there, 3 March 560. He represented Pope

Vigilius at Constantinople, won the favor of the Emperor Justinian, and as the choice of the emperor succeeded Vigilius in the papal chair in 555. Only two bishops and a presbyter assisted in his consecration, and the refusal of many bishops to accept the decrees of the 5th œcumenical council, which Justinian had convened in 555 upon the monophysite controversy, made his pontificate a period of trouble and dissension. The theological tenets concerning which he sustained a controversy with nearly the whole body of the western bishops are known historically as "The Three Chapters." He endeavored to reform the clergy; and when Rome was besieged by the Goths, he obtained from Totila, their general, many concessions in favor of the citizens. Sixteen of his Epistles are preserved in the *Concilia*.

PELAGIUS II, pope: b. Rome; d. January 590. He succeeded Benedict I, in 579, and was the first independently elected pontiff following the Byzantine conquest of 536. During his term of office a council at Constantinople roused his ire by bestowing upon the patriarch of that city the exalted title of "Universal Bishop." His most trusted counselor was Gregory the Great, who succeeded him. Ten of his Epistles together with six Decrees are to be found in the *Concilia*.

PELAGIUS, originally **ALVAREZ PAEZ**, celebrated Spanish prelate and ecclesiastical jurist: b. about 1280; d. Seville, 1352. After receiving the degree of doctor at Bologna, where he had studied theology and canon law, he went to Paris to continue his studies under the famous Duns Scotus. His talents and the purity of his life recommended him to John XXII of Portugal, who appointed him grand penitentiary to supervise and remedy the abuses and immorality that prevailed among the clergy. In 1332 Pelagius became bishop of Corón and subsequently bishop of Silves and papal nuncio to Portugal. Among several treatises on theology and canon law from his pen are 'Summary of Theology'; 'De planctu Ecclesiæ' (2 vols., 1474), a highly esteemed treatise, in which he argues for the limitless spiritual and temporal rights of the papacy and vigorously attacks the disorderly clergy; and also a notable 'Apology of John XXII.'

PELAGONIUS, a Greek veterinary surgeon who lived in the 4th century. Numerous fragments of his writings are found in Greek veterinary collections and in the 'Geoponiques.' A Latin work with an Italian translation, published at Florence in 1826, is entitled 'Pelagonii veterinaria ex Richardiano codice excerpta et a mendis purgata.' It contains numerous formulæ for veterinary remedies, which probably form a collection of different veterinary fragments, but chiefly those of Pelagonius.

PELARGONIC ACID, or **NONONIC ACID**, $\text{CH}_3(\text{CH}_2)_7\text{COOH}$, one of the nonoic acids. A monobasic acid, belonging to the acetic acid series, present in the leaves of the *Pelargonium roseum* and of rue (*Ruta graveolens*) and in the fusel oil from the beet-root. May be prepared in the laboratory by oxidation of oleic acid or of stearolic acid. It is a viscous oil at ordinary temperatures, becoming solid when cooled; boils with decomposition at 490°F . It has a quince-like odor due probably to ethyl pelargonate. This ester is prepared in

commercial quantities from the oxidation products of the oil of rue. It is used for improving the flavor of cheap wines and liquors.

PELARGONIUM, a genus of shrubs and shrubby perennial herbs of the family *Geraniaceæ*. About 170 species have been described, mostly natives of South Africa, whence some of them were introduced into European gardens during the latter part of the 17th and early part of the 18th century. Under the popular name geranium some of the species and their innumerable varieties and hybrids have long been popular garden, greenhouse and house plants, because of their fresh green or otherwise colored fragrant leaves, their bright, usually red or white flowers and free blossoming habits and for the ease with which they may be propagated and cultivated. Though the flowers vary little in form, except double varieties, they exhibit great diversity of color, markings and size. And on this account and because of the various markings of the foliage the cultivated species, their hybrids and varieties are arranged for convenience into various groups of which those to be mentioned are the principal. Zonal, horse-shoe, bedding, or fish types, popularly known as "geraniums," which appear to be the progeny of *P. inquinans* and *P. zonale*, are popular wherever ornamental plants are grown, but especially in the United States, where they thrive admirably in the hot, dry, sunny climate and probably outnumber any other house and home-garden plant in America. A subdivision of this group has double flowers but is less popular than the single-flowered forms because of their unkempt appearance. Ivy-leaved "geraniums" are derived from *P. peltatum*, a species which is said to have appeared in Great Britain in 1701. The plants are rather scraggly, but are popular for window-boxes, hanging-baskets and such things. The thick leaves are conspicuously angled, the flowers usually pink, often double and of pleasing tints. Rose "geraniums" are derived from various species; for instance, *P. radula* and *P. graveolens*. These are grown for their scented foliage. *P. odoratissimum*, the nutmeg geranium, belongs to this group.

The fancy types which gardeners call "pelargoniums," or Lady Washington geraniums, are less grown in America than in Europe, where they have an immense number of varieties and figure prominently not only in flower shows but in home gardens. The hot American summers seem to be against them; but they are somewhat cultivated in greenhouses. The species from which the group is derived are not definitely determined but *P. cucullatum*, *P. angulosum* and *P. grandiflorum* are all thought to be blended more or less. There are also several species which are cultivated under their specific names but none are as popular as the above.

As a rule the plants are propagated by means of cuttings rooted under glass during spring and potted in good loam. When the weather has become settled in the spring the plants are removed to the garden where they are allowed to remain until danger of frost when they are dug up, such cuttings taken as are needed and the plants potted for winter bloom or for stock. They may be stored in straw or hung from the ceiling of a dry cellar until wanted. Some of the kinds must be more carefully managed; but the common, popular

ones can be "mismanaged" more satisfactorily than probably any other plant.

PELASGIAN ARCHITECTURE, an arbitrary title given by some writers of Cyclopean Works (q.v.).

PELASGIANS, pē-lās'jī-anz, a legendary Indo-Germanic race which in prehistoric times was spread over Greece, Asia Minor and Italy. It has been held by some writers that the name does not represent a distinct race, but is merely an epithet, like *autochthones* or *aborigines*. Acusilaus (6th century B.C.) included under the title Pelasgia all Greece as far as Larisa and Pharsalia.

The Pelasgi are mentioned by Homer as dwelling in Argos and in Epirus; by Hesiod with Dodona as their seat. Herodotus says that Greece was anciently called Pelasgia and he includes as Pelasgians the Athenians, Arcadians, Ionians of Asia Minor, the Lemnians, the Samothracians and the inhabitants of Creston. He also speaks of them as worshipping all the gods at Dodona without giving a name to any. It is Arcadian tradition that Pelasgus was the first man to live in Arcadia and that during his time that country was known as Pelasgia. Strabo speaks of the Pelasgians as formerly spread over the whole of Hellas but particularly among the Æolians. There are also accounts of their inhabiting Bœotia and Attica. Herodotus mentions their non-migratory habits. Various accounts are given of their expulsion from Athens. Thucydides refers to Pelasgic as a word common among the Greek tribes before the use of the term Hellenic. Herodotus also says it was thus applied among the Athenians. They are mentioned by various writers from Homer downward as occupying islands in the Ægean. Herodotus enumerates 17 islands on the coast of Asia as belonging to them. They inhabited in his time the cities of Scylace and Placie on the Propontis and spoke a language different from Greek. Euripides says that all Greek traditions agree that Peloponnesus in the earliest times was called Pelasgia and that its inhabitants were known as Pelasgians.

Italian accounts of the Pelasgi are vague and difficult to reconcile. The Pelasgi are supposed here to have given to the Latin language the element it had in common with the Greek. Bishop Thirlwall interprets the reference of Herodotus to the language of the Pelasgians as signifying that they spoke a language differing from Greek as a remote but cognate branch of the same stock. Grote holds that Herodotus meant that the language they spoke was not Greek at all.

Niebuhr regarded the migrations of the Pelasgians as mythical, while he held that they inhabited all the countries from the Po to the Bosphorus and supplying a common foundation to the Greek and Latin languages. The supposed Pelasgian migrations are, he believed, only the scattered fragments of this once united people, whose greatness he places in prehistoric times. Other writers, such as Grote, receive the entire tradition of the Pelasgians with skepticism. Remains attributed to the Pelasgi are found in Italy, Greece and Asia Minor, but their diffusion is held to be at variance with the notion of their being the works of a single people, to such a degree as to form an independent testimony to the otherwise doubtful

existence of a race by whom they might have been executed. These remains belong to the style of architecture called Cyclopean. See CYCLOPEAN WORKS.

An exhaustive discussion of the traditions and historical references concerning the Pelasgians, with the conclusion that they were not mythical, is to be found in Wm. Ridgeway's 'Early Age of Greece' (Cambridge 1901). Consult also Hall, H. R. H., 'The Oldest Civilization of Greece' (London 1901) and 'Ægean Archaeology' (London 1915).

PELAYO, pā-lā'yō, a historical personage of the royal line of the Visigoths, who is considered the first Christian king of Spain, following its conquest by the Arabs. He appears to have withstood the Arabs in the mountain districts of Asturias (q.v.) in which the Christians of Spain had taken refuge. His death is recorded as occurring in 737. The genealogy of the reigning family of Spain is traced back to Pelayo.

PELECYPODA, pēl-ē-sip'ō-dā, or **LA-MELLIBRANCHIATA**, the class of aquatic *Mollusca* known popularly as "the bivalves" and which are distinguished externally by the possession of shells in two measurably symmetrical parts or "valves." They include the clams, oysters, scallops, cockles, mussels, the pearl oyster, teredos or shipworms, and similar forms. They range in size from the tiniest up to the prodigious *Tridacna gigas* of the Pacific, with a shell three feet across.

The pelecypoda number about 11,000 species which are classified in five orders. About one-fifth of these are fresh-water forms. Fossil remains of about 15,000 species have been recognized. See BIVALVES; MOLLUSCA, and the names of various groups and species. Consult Pratt, H. S., 'Manual of the Common Invertebrate Animals' (Chicago 1916).

PELÉE, Mont, mönt pē'lē (Fr. mön pā-lā), Martinique, West Indies, an active volcano in the northwestern part of the island, noted for its eruptions in 1902, that of 8 May destroying the town of Saint Pierre (q.v.), and nearly 30,000 people, and that of 30 August destroying Morne Rouge, Ajoupa-Bouillon, and other localities, with a loss of about 2,500 persons. Previously recorded eruptions were those of 1762 and 1851. Prior to 1902 the mountain was characterized as a lofty, solitary peak about 4,600 feet high with gradual slopes. Its crater was about one and a half miles in circumference and had a depth of from 1,000 to 2,000 feet below the level of the crater rim. On the southwest side the crater rim was breached to the base by a great gash which continued into the gorge of the Rivière Blanche; over 20 other ravines and waterways indented the mountain slopes. Within the great crater lay L'Etang Sec, a small crater lake. Since the eruptions of 1902 the crater has increased in width toward the east, south and southwest, the tuff walls on the east and south are almost if not quite vertical, while the V-shaped gash in the southwestern rim is wider and the southern side of it has been cut away and is now filled by volcanic débris. Over 180 feet of the summit was blown away, and the crater basin L'Etang Sec disappeared, but from it an enormous obelisk of polished rock with a basal thickness of 300 to 350 feet extruded to a height

of 1,600 feet or more, towering above the lowest portion of the present crater rim 475 feet, and giving Mont Pelée a varying altitude of from 5,100 to 5,140 feet as the extrusion continued and fragments broke away from its summit. (See MARTINIQUE). Consult Heilprin, 'Mont Pelée and the Tragedy of Martinique' (1903).

PÉLÉE (pě'lē) ISLAND, an island in Lake Erie lying 10 miles off the southwestern coast of the province of Ontario, Canada, southwest of Point Pelée. It is a part of Essex County, Ontario. It is nine miles long, from north to south, and from three to four miles wide. It is the most southerly land of the Dominion of Canada, lying in lat. 42° N., on the same parallel as the city of Boston, and of Rome, in Italy. Its chief product is grapes and tobacco is grown there successfully. It also has some timber land and the sand on the shores is in special local favor for building.

PELEG ARKWRIGHT, a pseudonym used by David Law Proudfit (q.v.) for a series of newspaper contributions, written partly in dialect. Achieving success with these he began writing under his own name.

PELEIDES, in Greek mythology, a son of Peleus. See ACHILLES.

PELEUS, pē'lūs or pē'lē-us, in Greek legends, the son of Æacus king of the Myrmidons of Thessaly. He is said to have married the sea-nymph Thetis, and thus the father of Achilles (q.v.). Tradition relates that he took part in the expedition of the Argonauts.

PELEW (pě-loo') ISLANDS, a group of 26 small islands in the Pacific between lat. 7° and 8° N. and long. 134° and 135° E. They lie west of the Caroline group, and are sometimes considered a part of this group; area, 190 square miles. They were discovered in 1543 by Ruy Lopez de Villalobos, who called them the Arrecifos. Six of them are inhabited; the largest island is Babelthuath, in the northern part of the group, 24 miles long. The islands are hilly, heavily wooded, and completely surrounded by coral reefs. The soil is fertile, and sugar, bread-fruit, tobacco, bananas, oranges and other tropical fruits are raised. Tortoise shells and mother of pearl are also obtained. The people are the Micronesian race and are ruled by a king who resides on the island of Korror. They are a primitive people and have a number of interesting social customs which make them an important subject of ethnological study. These islands were taken possession of by Spaniards in 1545 and were held by Spain until 1899 when they were sold to Germany with the Caroline and Marianne Islands (except Guam). In October 1914, with the latter mentioned groups of islands, the Pelew Islands were seized by the Japanese fleet, remaining in their control until the end of the war, when the mandatory administration of the islands was assigned to Japan by the Peace Treaty of May 1919. Pop. 5,500.

PELHAM, pē'l'am, Peter, English mezzotint-engraver: b. England about 1684; d. Boston, Mass., December 1751. Data concerning his early life is not obtainable, but he was probably born at Chichester and some authorities fix

the date of his birth about 1694. The earliest date found on any of his plates is 1720. In 1726 he came to Boston, where he established a school in which reading, writing, dancing and needlework were taught, and he gave lessons in drawing and painting, at the same time continuing his engraving. He was the earliest artist resident in New England and his portrait of Rev. Cotton Mather (1727) was the first mezzotint engraving produced in America. He was stepfather to John Singleton Copley (q.v.) and his first instructor in art. Among his subjects are George I; Queen Anne, after Kneller; Oliver Cromwell, after Walker; Rev. John Moorehead (1731) and Rev. Mather Byles, after his own originals; Rev. Benjamin Colman (1734); Rev. Wm. Cooper and Rev. Joseph Sewall, after Smibert; Governor Shirley (1747); Rev. Edward Holyoke and Thomas Hollis, after Highmore (1749).

PELHAM, or THE ADVENTURES OF A GENTLEMAN, a novel by Bulwer-Lytton, appeared anonymously in 1828. It was the writer's second published novel, following "Falkland," and the first work of his that gave promise of his extraordinary ability.

PELHAM-HOLLES, Thomas, 1st Duke of Newcastle. See NEWCASTLE, THOMAS PELHAM-HOLLES, 1ST DUKE OF.

PELIAS, pē'lī-as, in Greek mythology, the son of Poseidon (Neptune) and Tyro. He drove his younger stepbrother Æson, son of Tyro and Crethens, from the throne of Iolcus. He was killed and his body dismembered and boiled, by his own daughters at the instance of Medea who promised them that in this way he could be restored to youth. According to another form of the myth Medea killed him.

PELICAN, a web-footed bird of large size, weighing up to 16 pounds, of the genus *Pelecanus*, order *Steganopodes*. The pelicans form a distinct family (*Pelecanidae*) easily distinguished by the great membranous pouch which is attached to the throat and hangs from the rami of the long lower mandible. The upper mandible is straight, 14 to 18 inches long and sharply hooked at the end. Pelicans range in size from four to six feet in length, with a wing expanse of eight to nine feet, the wings bearing numerous quillfeathers, and having great powers of flight. As in some related birds the pneumatic system is wonderfully developed, extensions of the anterior air-sacs passing beneath the skin and there developing into an extensive area of subcutaneous air-cells. Ten species of pelicans are known which inhabit most tropical and temperate parts of the world, and fossil remains of nine other species show their existence as far back as the Lower Miocene (in France). Of the living species, three are American. Two of these are maritime inhabiting the coasts of the Southern States. The other, the white pelican, frequents only fresh water in the summer, nesting far to the north, but in the winter goes to salt water districts in the South. The American white pelican (*P. erythrorhynchos*) is abundant along the Gulf Coast and, in the interior, in the Mississippi Valley and westward, far into Canada, and is common on the coast of California; elsewhere in temperate North America it is rare. With the exception of the black primary wing-quills

and neighboring parts, the plumage is entirely white, often with straw color on the breast. In the spring the beak of the male develops midway of its length a rough horny crest which reaches its greatest dimensions (three inches) in the breeding period, and is subsequently molted. This species often lives in great communities, especially during the breeding season. The only nest is a rude heap of earth and trash, on which a single egg with a thick, chalky, white shell is deposited. The young are hatched naked but are soon covered with a growth of white down, and later with a heavy plumage. The flight is easy, graceful and sustained; and the bird is fond of rising to great heights and soaring evidently for pleasure. When feeding they skim the surface of the water or dive beneath it, and scoop up small fishes in the net-like pouch, and, after draining the water off, swallow them. The white pelican is often seen in long lines beating the water with their wings and so driving the fish into shoal water where they are easily captured. The young are fed on fish regurgitated from the crop, and not upon living fish carried in the pouch. Unlike the white pelican, which frequents the shores of lakes and rivers, as well as the sea, the brown pelican (*P. occidentalis*) is strictly maritime on the Atlantic Coast of tropical and subtropical America. The general color is mottled silvery gray and brown, the top of the head being white, and there is no crest on the beak. In feeding this species plunges on its prey from a height of 20 feet above the water, thus differing from other pelicans. Two or three eggs are laid in a coarse nest of sticks placed on the ground. The general habits resemble those of the white pelican. The California pelican (*P. californicus*) is the representative on the Pacific Coast of the brown pelican, which it closely resembles. Its head and neck are white, the general color being silvery gray streaked with brown. It is found from the Galapagos Islands as far north as British Columbia. In Europe are found a white pelican (*P. onocrotalus*) lacking the rostral crest, and a larger and rarer species (*P. crispus*). Other species of similar habits occur in Australia, Asia and Africa.

The pelican is the Hebrew Kâath, and from the fact of its resorting to the most lonely places it is used in the prophecies and psalms as an emblem of solitude and desolation. Popular fancy has ascribed the red tip at the end of its beak to blood drawn from its own breast for the nourishment of its young; hence in ecclesiastical symbolism it represents the church feeding her children with her life. Thus the pelican early found a place in Christian art, and like the fish and the peacock has been emblazoned in windows and mosaics, carved in stone and wood, and enameled in crimson and white on chalices and sacred vessels. Its highest symbolic significance was reached when it was used as an emblem of Christ whose blood was poured out for mankind. There are traces of this symbolism in the litanies and hymns of the ancient church, as well as the creations of art. Consult Twining, 'Symbols and Emblems of Christian Art' (1886); also, Bailey, F. M., 'Handbook of Birds of the Western United States' (Boston 1914); Chapman, F. M., 'Birds of Eastern North America' (New York 1916).

PELICAN, The. See ARGUS AND PELICAN.

PELICAN-FISH, a fanciful name given to the deep-sea fishes of the family *Eurypharyngidae* (specifically *Eurypharynx pelecánoides*), representing a distinct order Lyomeri, the gulpers. There are four genera, *Saccopharynx*, *Eurypharynx*, *Macropharynx* and *Gastrostomus*, each represented by a single species. These rare fishes have an eel-like body, reaching at least six feet in length, four-fifths of which is tail, and an extraordinary structure probably derived from some eel-like ancestor. They are, however, of a distinctly lower physical type, the muscles being feebly and loosely developed and the bones, especially of the head, very soft and elastic. They have an enormous development of the jaws and the throat and stomach are capable of great distension suggesting the pouch of a pelican. They are believed to feed on the minute animal life in the deep sea, taking in great mouthfuls of water and straining out the animalculæ through their long fringe-like teeth. It is not uncommon for some of these creatures to swallow a fish as large or larger than itself. The attempts of the *saccopharynx* to exceed even that limit were for a time our only knowledge of its family, the few specimens known being those found floating dead with a fish in the pouch too large to be disposed of. Specimens of all four of the genera named have been secured by dredges at depths varying from 2,350 feet to 8,800 feet. Consult Goode and Beau, 'Oceanic Ichthyology' (1895). See DEEP-SEA EXPLORATION.

PELICAN ISLAND, (1) an island, now a bird reserve, off the east coast of Florida, in Indian River, so called because brown pelicans breed there. It has an area at high water of about five and one-half acres. Desiring to prevent the extinction of the birds, the Audubon Society tried to gain possession of it, but failed to accomplish their purpose on account of the large amount of litigation involved. In 1903 the United States government took possession and the Secretary of Agriculture established a bird reserve there, to guard against the total extinction of the pelicans. The reserve was enlarged in 1909, by order of President Roosevelt. The island is very low, and when a storm or very high tide occurs at nesting time, hundreds of the young birds are drowned. (2) An island in Lake Winnipeg, about latitude 52° 20' N. The principal meridian of Canada passes just to the west of the island. It belongs to the province of Manitoba. (3) An island in Princess Charlotte Bay off the north-east coast of Australia, in latitude 13° 50' S.

PELICAN STATE, a popular name for the State of Louisiana.

PELICAN'S FOOT, a small mollusk, (*Aporrhais pes-pelecani*) a native of Europe, one of the four living species of the genus *Aporrhais*. The species *A. occidentalis*, found off the northern coasts of the United States is the only American representative. This shell gets its name from the arrangement of the spiny protuberances extending from the outer lip, suggesting the webbed foot of the pelican. The characteristic form of the shell is only attained in the adult period, the young shell being destitute of spines. Though only about two

inches in length, the pelican's foot is an article of food in Southern Europe.

PELION, pé-li-ôn, Greece, now Mount Plessidi. See Ossa.

PELISSIER, pâ-lê-sê-â, Jean Jacques Aimable, Duke of Malakoff, marshal of France: b. Maromme, near Rouen, 6 Nov. 1794; d. Algeria, 22 May 1864. Educated at the military school at Saint Cyr, he entered the army in 1815 as sublieutenant of artillery. In 1819 he became a staff officer, subsequently serving in Spain in 1823, in the Morea in 1828-29 and in Algeria in 1830. In this country, being then a colonel, in 1845 he suffocated in a cave a whole tribe, numbering some 600 Arabs, who had taken refuge in it, by lighting a fire at the mouth, an atrocity which aroused great indignation; but Bugeaud, commander-in-chief, declared that Pelissier had only obeyed positive orders. He was made a general of brigade in 1850 and a general of division in 1855, and was placed in command of the forces operating at Sebastopol. On the capture of the Malakoff and the fall of Sebastopol he was appointed marshal of France and made Duke of Malakoff. In 1856 Sir Hugh Gough, the field marshal of Great Britain, was sent to the Crimea to invest Marshal Pelissier with the insignia of the Order of the Bath. He was afterward vice-president of the senate, a privy-councilor and Ambassador to England (1858), and in 1859 was made Grand Chancellor of the Legion of Honor. In 1860 he was appointed governor-general of Algeria.

PELL, John, English clergyman and mathematician: b. Southwick, Sussex, 1 March 1611; d. London, 12 Dec. 1685. Educated at Cambridge, he became professor of mathematics at Amsterdam in 1643 and in 1646 at Breda, where he was also professor of philosophy. From 1654 to 1658 he was the agent of Cromwell to the Protestant cantons of Switzerland. In 1661 he took orders in the English Church and was rector of Fobbing and vicar of Laindon, Sussex, till his death, but was more notable for his mathematical attainments than in his clerical labors. Through his publication in 1668 of a solution (not his own) in his algebra of the equation $y^2 = ax^2 + 1$, this particular expression received the distinguishing title, "Pell's equation." To him is frequently attributed the invention of the symbol of division $\div$ but the credit of this is in reality due to Rahn, whose work, which Brancher had translated, was edited by Pell in 1668. Among his works are 'Astronomical History of Observation of Heavenly Motions and Appearances' (1634); 'Ecliptica Prognostica' (1634); 'Controversy on the Quadrature of the Circle' (1646); 'An Idea of the Mathematics' (1650); 'A Table of Ten Thousand Square Numbers.' In addition to these published works he left a great mass of manuscripts and letters, many of them on mathematical subjects, and 40 large folio volumes, filled with them, are preserved in the British Museum. In his old age he was reduced to extreme poverty, and when he died he received private burial only through the charity of former acquaintances.

PELLA, (1) a city of ancient Macedonia on a marshy lake formed by the river Ludias: a royal city in the 5th century, when it was

Archelaus' capital, it was remodeled by Philip II, who removed his capital here from Edessa. It was the birthplace of Alexander the Great, the site of a splendid castle adorned with paintings by Zeuxis and of a cenotaph of Aristotle, and in Roman times was the central military station for the province. It is identified with the modern Palatitza, where excavations of importance (described in Hauzey and Daumet, 'Mission archéologique en Macédoine' (1876) have been made. A funeral stele of great artistic interest belonging to the late 5th century or the early 4th century B.C. is preserved in the Imperial Museum at Constantinople. (2) An ancient and important city of Palestine, east of the Jordan, famous as the refuge of the Christians of Jerusalem when that city was taken by the Romans (67 A.D.), and identified with Tabakat Fahil. It was taken by Antiochus the Great in 218 B.C., and was later destroyed by the Jews under Alexander Jannæus. After being rebuilt it was captured by Pompey, who restored it to its original inhabitants. Portions of the wall are still standing, and the famous fountain mentioned by ancient writers remains unchanged to identify the locality.

PELLA, Iowa, city in Marion County, on the Chicago, Rock Island and Pacific Railroad, 45 miles southeast of Des Moines. Central Baptist College is located here and there are a public library, canning and pickle factory, feeder works, flouring mills, brick and tile works, wagon works, furniture factory, tank and pipe works, etc. The municipality owns the water-supply system and the electric-lighting plant. Pop. 3,338, mostly of Dutch descent.

PELLAGRA, a disease, or complication of diseases, discussed in Italy under this name in the 18th century and which since that time has been rapidly increasing. It is common in northern Italy, in the south of France, in Spain and in countries further east in southern Europe. Within recent years it has been found extensively in the United States, particularly in the Southern States. It more frequently begins with an erysipelatous eruption on the skin, which breaks out in the spring, continues till the autumn and disappears in the winter, chiefly affecting those parts of the surface which are habitually exposed. The disease is accompanied or preceded by remarkable lassitude, melancholy, moroseness, hypochondriasis and not seldom by suicidal tendencies. With its progress and duration the disorder becomes more aggravated, with shorter and shorter intervals in the winter. At length the surface ceases to clear itself and becomes permanently enveloped in a thick, livid, leprous crust, somewhat resembling the dried and black skin of a fish. By this time the physical resistance is reduced to a very low ebb and not seldom the mental functions as well. The victim loses the use of his limbs, especially of the legs, suffers with violent colic, headache, nausea, flatulence and heartburn, the appetite being variable. The countenance becomes void of expression. There is a sense of burning heat in the head and along the spine, where it radiates to other parts, especially to the palms and soles, tormenting the victim day and night. To these severe afflictions are often added strange hallucinations. The disease, when advanced, takes the

form of many other maladies, such as tetanus, convulsions, epilepsy, dropsy, mania and marasmus, the patient being at last reduced to the appearance of a mummy. It is mainly confined to the poor residing in the country districts and is seldom seen in very young children.

The cause of this disease has been ascribed to the eating of corn, in which a putrefaction occurs during the warm season. Just what food factor is wanting is not yet certainly known. Consult Marie, A., 'Pellagra' (1910), and *Reports*, United States Marine Hospital Service.

PELLATT, pĕl'ăt, **SIR Henry Mill**, Canadian capitalist: b. Toronto, 1860. He was educated at Upper Canada College and joined the staff of the brokers' firm of Pellatt and Osler at the age of 15; later he was taken into partnership by his father. He is president of the Toronto Electric Light Company, of the Electrical Development Company of Ontario, Ltd., of the British and Colonial Land and Securities Company and of the British-Canadian Dock and Shipbuilding Company, and director in very many industrial corporations. In 1901 he received the command of the Queen's Own Rifles and the command of the Canadian contingent at the coronation of King Edward. In 1910 he took a contingent of the Rifles to England for army manoeuvres. In 1912 he was made brigadier of the 6th Infantry brigade.

PELLÉAS (pĕl-lă'az) **ET MÉLISANDE** mă-lî-săn'd'. To understand Maurice Maeterlinck's 'Pelléas et Mélisande,' one must have some knowledge of this dramatist's theory of dramatic technique. The style of his early small dramas consisted of iteration of phrase and elision of thought. They dealt with the unseeable forces of destiny and resorted to external accessories, like storms, meteors, mysterious lights and felt presences — characteristic of certain morbid romances, but going beyond the conventional romance by the added grace of an inner mystic beauty.

Then there befell a change of attitude in Maeterlinck toward the theatre; his dialogue became less shadowy and more representative of definite character. This change was partly due to the fact that he discovered for himself the shortcomings of his theory, and that philosophically he had advanced out of the murkiness of the "Cymbalist" school into the light of health and a sound will, through the influence of Georgette Leblanc, whom he married about this time. This explanation is necessary in order to understand why 'Pelléas et Mélisande' is so mystic and "misty." Maeterlinck here used, as a basis for his play, the story of Francesca and Paolo, so appealingly stated by Dante in the famous 14 lines in "The Inferno." It is a simple love story, told in half-uttered phrases, in which impulsive and faintly developed youth and wise old age flit across the horizon at moments when Nature announces the descent of destiny on willless characters.

The play was printed in Brussels in 1892 and was first played at the Théâtre des Bouffes-Parisiens, with Lugné-Poë as Golaud and Mme. Marie Aubry as Pelléas. It was used as the libretto for an opera by Claude Debussy, an exponent of the "new" school of music in

France, and was produced at the Opéra-Comique in Paris 30 April 1902. A storm of protest followed this *première*, for the score was unmelodic and filled with dissonance. There was likewise some ill feeling due to the fact that the composer wished Miss Mary Garden, rather than Madame Maeterlinck, to appear as Mélisande. The opera was first heard in America at the New York Manhattan Opera House, under the direction of Oscar Hammerstein, 19 Feb. 1908, with the original Parisian cast. As a play 'Pelléas et Mélisande' received notable presentation when, in June 1898, Mrs. Patrick Campbell appeared as Mélisande, Forbes Robertson as Golaud and Martin Harvey as Pelléas. Later, in America, Mrs. Campbell appeared with Madame Bernhardt, who played Pelléas. 'Pelléas et Mélisande' was one of the pieces selected by Madame Maeterlinck for outdoor performance at the Maeterlinck château of Sainte-Wandrille. A sympathetic English translation of this play was made by the late Richard Hovey.

MONTROSE J. MOSES.

PELLEGRIN, pĕl'-grăn, the pseudonym of the Baron de la Motte-Fouqué. See FOUQUÉ, FRIEDRICH HEINRICH KARL, BARON DE LA MOTTE-FOUQUÉ.

PELLEGRINI, pĕl-lă-grĕ'nĕ, **Carlo**, English caricaturist: b. Capua, Italy, March 1839; d. London, England, 22 Jan. 1889. He was descended from the de Medicis on his mother's side. He received a good education, but soon dissipated the fortune inherited from his father. He entered Garibaldi's army and fought at Volturmo and Capua; and went to England in 1864, where he began his career as a caricaturist. His humorous drawings of men in public life, beginning with Disraeli and numbering several hundred, were published in *Vanity Fair* over the signature of "Ape" from January 1869 until his death, and won for him a national reputation. He also achieved some eminence as a sculptor and painted some portraits which were exhibited at the Royal Academy and the Grosvenor Gallery. Among his intimates at one time he was affectionately called "Pelican."

PELLEGRINI, Pellegrino. See TIBALDI PELLEGRINO DI BOLOGNA.

PELLETIER, pĕl-tĕ-ă, **SIR Charles Alphonse Pantaléon**, Canadian statesman: b. Rivière Ouelle, province of Quebec, 22 Jan. 1837. He was graduated from Laval University in 1858, studied law and was admitted to the bar in 1860, becoming queen's counsel in 1879. He sat in the Dominion Parliament for Kamouraska, 1867-77, was Minister of Agriculture, 1877-78, was made speaker of the senate in 1896, having been a member of that body from 1877, and was knighted in 1898.

PELLEW, pĕl'oo, **Edward**, British admiral. See EXMOUTH, VISCOUNT.

PELLEW, pĕl'oo, **Henry Edward**, American social reformer: b. Canterbury, England, 26 April 1828. In 1853 he was graduated at Trinity College, Cambridge, and received his M.A. at Oxford in 1870. He was one of the founders of Keble College, Oxford, and was on the executive boards of Feltham Industrial School and other institutions, and identified

with various London hospitals and charities. In 1873 he came to the United States, organized the Bureau of Charities in New York in association with the late Theodore Roosevelt, and was active in organizing night refuges, a free circulating library, coffee houses, the first tenement-house reform movement and the erection of improved dwellings. Since 1888 he has resided in Washington, D. C., where he is interested in work among the negroes, in the formation of the Washington Protestant Episcopal diocese and in aiding the building of the Washington cathedral.

PELLICO, pěl'lē-kō, **Silvio**, Italian poet and dramatist: b. Saluzzo, Piedmont, 24 June 1788; d. Turin, 1 Feb. 1854. At the age of 16 he went to Lyons, France, where he remained a few years and on his return became a private tutor. In 1810 he became an instructor in the French language in an institution at Milan. In 1818 he joined Romagnosi Manzoni and others in establishing *Il Conciliatore*, a literary journal in the patriotic interest, which was suppressed by Austria after a two years' publication (1818-20). He was arrested in 1820 as a member of the Carbonari, and on 21 Feb. 1822 was finally condemned to death. The emperor, however, commuted the sentence to an imprisonment for 15 years in the citadel of Brünn, Moravia. He was released in 1830 and went to live at Turin. His health had been broken by his suffering, however, and his record of his experiences, 'Le Mie Prigioni' ('My Prisons,' 1832), made him, says Garnett, "as typical a figure as the Iron Mask or the Prisoner of Chillon." It was soon translated into many languages; there is an English version by Roscoe (1833). Pellico's lyric verse is indifferent, and but one of his tragedies, 'Francesca da Rimini' (1818), has remained famous, although 'Laodicea' was highly esteemed in its time. Of this there is a rendering into English by Bingham (1897; 'Italian Gem' series). Consult *The Foreign Quarterly Review*, April and October, 1833; Longfellow, 'The Poets and Poetry of Europe' (1845); Giuria, 'Silvio Pellico e il Suo Tempo' (1854).

PELLITORY, or **SPANISH CAMOMILE**, a plant (*Anacyclus pyrethrum*) closely related to and resembling chamomile (q.v.) of the same order and belonging to an allied genus. The flowers are considerably larger, and are less numerous than those of camomile. It is a native of the Levant and of southern Europe. The root has a hot, pungent taste, derived from a fixed resinous matter, which stimulates the salivary glands, and excites a glowing heat in the mouth. A genus of plants (*Parietaria*) of the nettle family is known as wall-pellitory. The common wall-pellitory (*P. officinalis*) is a herbaceous perennial, which contains nitre, and was formerly used as a diuretic.

PELOPIDAS, pē-lōp'ī-das, Theban general and statesman: d. Cynoscephalæ, Thessaly, 364 B.C. He was a son of Hippocleus, inherited great wealth, and was an intimate friend of Epaminondas. In 382 the Spartan leader Leontiades seized the Cadmeia, the Theban citadel, and Pelopidas was driven into exile at Athens. He returned in 379 with a small band, and in a surprise attack at night, which has become classic, recovered the Cadmeia, overthrew the Spartans and with his own hand slew Leontiades.

A democratic government was formed and Pelopidas became its leading general. He won the battle of Tegyra against the Spartans in 375, and aided Epaminondas to defeat the Lacedæmonians at Leuctra in 371, making Thebes for a time the ruling power of Greece. In 368 Pelopidas headed the expedition against Alexander of Pheræ and was treacherously taken prisoner, but was liberated by Epaminondas and was sent on an embassy to the Persian court, where great success attended him. In 364 he again moved against Alexander and defeated the latter's forces at Cynoscephalæ, but was slain during an impetuous pursuit of his fleeing enemy. Consult Plutarch, 'Life of Pelopidas.'

PELOPONNESIAN WAR, the interne-cine and intermittent contest, hardly to be dignified by the term war, between Sparta and Athens for the hegemony of Greece 431-404 B.C. The aristocratic party in Athens, after the second Persian Invasion in 480, had in general under the leadership of Aristides and Cimon aimed to effect a cordial understanding with all the Greek states and especially with Sparta, leaving her leadership unquestioned. But the democratic leaders of Athens' golden age, coming into power in 460, changed all this, recognized the natural contrariety of the interests of the two states, built up the city's navy, strengthened the Peiræus, formed an Ionic league, which soon proved a mere means of money getting for the expenses of the growing navy, and provoked the struggle. In 435 Athens as ally of Corcyra assisted that city when Corinth undertook to protect Epidamnus, a Doric colony, against Corcyra; and immediately Corinth summoned the aid of Sparta. In 431 when Thebes, a city of central Greece, but a bitter enemy of Athens, opened the war by attacking Plataea, Athens was supreme at sea, Sparta on land; Athens had a widely scattered and weakly bound empire. Sparta's was massed in the Peloponnese, with important outposts at Athens' very door, and Athens represented Ionic democracy, Sparta, Doric oligarchy. The result was that the war became not a mere conflict between two leagues, but a manifold civil war, the democratic party in each siding with Athens, the oligarchy with Sparta, and each ready to massacre the other. As for the two principal actors in the struggle—Athens attempted by sea to devastate the coasts of the Peloponnese, and Sparta striking by land laid waste the state of Attica with the exception of the city of Athens and its long walls reaching down to the sea. In 429 Pericles, the able Athenian leader, died of the plague that ravaged the city, and two years later Athens captured Mytilene, and the Spartans and Thebans took Plataea, the most bloody outrages taking place in each conquered town. In 425 Athens seemed utterly successful; she fomented a rising in Corcyra which annihilated the pro-Spartan aristocrats; and she captured an entire Spartan garrison on the island of Corcyra—a terrible blow to an army whose motto was "Death or victory." Sparta sued for peace, but Cleon and the other demagogues of Athens refused. The operations in Thrace against Athens' possessions there were carried on brilliantly by Brasidas, but at Amphipolis in 422 both he and Cleon were killed. Nicias (q.v.), an aristocrat and a Conservative, took the place of promi-

nence held by Cleon at Athens and negotiated in March 421 a 50-year truce, which unfortunately did not bind the Spartan allies, and even in Athens was soon disregarded owing to the growing influence of Alcibiades (q.v.). In 420 he formed a league between Athens, Mantinea, Argos and Elis; then planned to bring about the defeat of Sparta in the Peloponnese by means of Argos—a scheme crushed by the Spartan victory over the Argives at Mantinea (418). The unfortunate Sicilian expedition (415–13) might have succeeded had not Alcibiades been forced out of command and into the enemies' camp. As it was, it struck at Athenian maritime prestige and practically finished the war. The eight years before the actual end were marked by sudden renewed vigor on the part of Athens due to the recall of Alcibiades in 411; his victories at Abydos and Cyzicus in 408 were the last that Athens won. Then Sparta with the unlimited wealth of Cyrus as backing gained the lucky victory of Ægospotami (405), Athens was taken, and the long walls were razed (404). The story of the war is told by Thucydides (q.v.), the first great philosophical historian, whose incomplete narration is supplemented by Xenophon's 'Hellenica.' Consult the authorities under GREECE, *History*.

PELOPONNESUS, pēl-ō-pō-nēs'ūs, or **PELOPONNESE** (Greek, 'Pelops' Island'), the ancient name for southern Greece, the large peninsula now known as the Morea, because its outline resembles that of a mulberry leaf. It is an individual mountainous system of more than 8,300 square miles, reaching at its apex an elevation of 7,875 feet. It is attached to the mainland by the slender isthmus of Corinth, which has the Corinthian Gulf on the west and the Saronic Gulf on the east. The chief divisions of the country in ancient times were Arcadia, in the centre, Achaia, to the north, Elis, to the west, Messenia, to the southwest, Laconia, to the southeast, and Argolis, to the northeast. There was never much trade in the Peloponnese; its people were farmers and herdsmen. At one period it was notorious for its roaming bodies of brigands. Patræ (q.v.) was the only port of importance. It contained the cities of Mycenæ, Sicyon, Tiryns, Corinth, Argos, Træzen, Epidaurus, Sparta, Pylos, Methone, Elis, Ægium, Tegea, Mantinea and Megalopolis. Consult Clarke, 'Peloponnesus, Notes of Study and Travel' (1858); Beulé, 'Études sur le Péloponnèse' (1875); Curtius, 'Peloponnesos' (Gotha 1851–52); Leake, 'Travels in the Morea' (London 1830); and 'Peloponnesiaca' (ib. 1846); and Philippon, 'Der Peloponnes' (Berlin 1892); Blonet, 'Expédition scientifique du Morée' (Paris 1838). See GREECE.

PELOPS, pē'lōps, a legendary personage appearing in Greek mythology, as the son of Tantalus, king of Lydia, and the grandson of Zeus. He became a suitor of the beautiful Hippodamia, and by defeating her father Ænomaus, king of Pisa, in a chariot race, through the treacherous connivance of Myrtilus, the king's charioteer, obtained the bride with a kingdom. Myrtilus had been won over by an offer of half the kingdom; but Pelops, being unwilling to keep faith with him, threw him from a cliff into the sea. The drowning man cursed his murderer, and to this curse was at-

tributed all the misfortunes that fell upon the house of Pelops. Peloponnesus received its name from him. Of his sons, Atreus and Thyestes are most celebrated. After death Pelops received divine honors, and a temple was built to him in the grove at Olympia, in which was the Pelopium where sacrifices to him were offered. His memory was further perpetuated in sculptures on the east pediment of Olympia. History records his name as the leader in the Achæan invasion, 1300 B.C.; and attributes to him the restoration of the Olympian games.

PELORIA, in botany, the appearance of regularity of structure in the flowers of plants which normally bear irregular flowers, instances of which occur in the snap-dragon and the toadflax, which being normally irregular, assume a symmetrical form. It seems to be the result of abnormal conditions, especially as concerns light.

PELOTA, pā-lō'tā, or **JAI-ALAI**, a Spanish ball game popular in Cuba, South and Central America, and latterly in certain parts of the United States. It is played both indoors and out; but requires a court or concrete floor, 200 feet long and 65 feet wide, with a front wall 36 feet square at one end and a second or rebounding wall of similar dimensions at the other end of the court. The game is played with a ball, about the size of a lawn tennis-ball and a long, narrow, curved wicker work basket or *chistera* fastened to the hand by means of a glove. The players number four, six or eight, divided equally into sides or teams. In the professional game there are three players on a side. The ball is bounded from basket to wall and must always be kept in motion. The game is usually of 50 points. What cricket is to England, football and baseball are to the United States, lacrosse and hockey are to Canada, pelota is to Spain and other Spanish-speaking countries. It is claimed for this game that it requires a better eye, more speed, activity and surer control over every muscle of the body than any other sport.

PELOTAS, pā-lō'tās, Brazil, city and most southerly port of the state of Rio Grande do Sul, 25 miles northwest of the city of Rio Grande, on the left bank of the São Gonçalo River. The bar of the embouching river has been cleared away and Pelotas has become one of the most important of Brazilian ports because of its fine harbor. The São Gonçalo makes commercial relations with Uruguay possible. While the commercial section of the city is not always inviting, the residential quarter and the suburbs are attractive. Its chief industry is drying and powdering meat; there are great abattoirs near the city and 600,000 cattle or more are killed each year. Pop. about 33,000. There are many Europeans, especially Germans and Italians, in the city. The port serves also a considerable part of Uruguay, and its chief exports are the hides of cattle and horses, and a quantity of maté, or Paraguay tea. The imports are chiefly coal, iron and steel, both raw and manufactured, cotton goods, china, glass and earthenware, flour, paper, machinery and firebrick.

PELOUBET, Francis Nathan, American author: b. New York City, 2 Dec. 1831; d. March 1920. In 1853 he was graduated at Williams

College and in 1857 at the Bangor Theological Seminary and in the same year entered the Congregational ministry. From 1857 to 1883 he held various pastorates in Massachusetts, after which he has devoted himself to religious literary work. His published works include 'Select Notes on the International Sunday School Lessons' (44 annual vols., 1875-1918); three grades of Sunday School Quarterlies for the Scholars, 1880-1919; 'Suggestive Illustrations on Matthew, John and Acts' (3 vols., 1898-99); 'Loom of Life' (1900); 'The Teacher's Commentary on Matthew and on Acts' (1901); 'Front Line of the Sunday School Movement' (1904); 'Studies in the Book of Job' (1906); and various articles on the Sunday School. He edited 'Select Songs for the Sunday School' (Vol. I, 1884; II, 1893); 'Revision of the Oxford University Bible Helps'; 'The Cyclopedic Concordance' (1903); a second revised edition of Smith's 'Bible Dictionary'; 'The International Bible Dictionary' (1912); 'Treasury of Biblical Information' (1913); 'Oriental Light' (1914).

PELTIER EFFECT, a phenomenon of cooling, or the apparent absorption of heat, observed by J. C. A. Peltier at the junction of two rods of metal, when a current is made to pass through both in the same direction as the current which heats them. It is well known (see THERMO-ELECTRICITY) that heat is transformed into electricity in a thermo-electric circuit. The electric current in passing through all parts of the circuit tends to heat the conductors, so that it would seem as if the current merely carried heat from the thermo-electric junction to other parts of the circuit, effecting an equalization of temperature. The heat is transformed into electricity not only at the hot junction, but also, as Lord Kelvin has shown, at portions which have different temperatures of one or both metals. Peltier discovered that a current flowing in a circuit composed of two metallic conductors heated one junction and cooled the other, and it came to be supposed that, as in a thermo-electric circuit, the currents hitherto observed had cooled the hot and heated the cold junction in the manner observed by Peltier, the heat producing the current was wholly absorbed at the hot junction, and given out at the cold junction, diminished by radiation, and by the heat equivalent of the work done in the rest of the circuit. It has been shown by Lord Kelvin that this explanation is incomplete. When the temperature of the junction is at the "neutral point" (see THERMO-ELECTRICITY) the two metals are thermo-electrically identical, and no Peltier effect can occur, yet a current passes through a circuit when the hot junction is at the neutral point and the other is not, and therefore there must be absorption of heat somewhere else in the circuit than at the junctions. It has been proved that in a copper wire a current carries heat with it from a hot place to a cold one; whereas in an iron wire a current carries heat with it from the cold places to the hot ones, thus retarding equalization of temperature throughout the circuit. See ELECTRIC DIRECT CURRENT.

PELUSIUM, pē-lū'shī-ūm, ancient city of Egypt, situated at the northeastern extremity of the delta of the Nile, and giving its name, which in Greek meant "mud city," to the eastern or

Pelusiatic mouth of the Nile at Tineh, 40 miles to the north. The city of Pelusium is probably to be identified with Sin of the Bible. It was the scene of several battles, notably the defeat of Sennacherib's besieging forces owing to the fact that the night before the battle a host of field-mice made their way into the Assyrian camp and gnawed through the bowstrings; and the victory of Cambyzes in 525 B.C. which put an end to the Egyptian Empire. Pelusium is celebrated as being the birthplace of the geographer Ptolemaeus. All that remains of the city at the present day is a few mounds and fragments of broken columns.

PELVIC GIRDLE. See PELVIS.

PELVIS (Latin, "basin"), the bony basin formed by the haunch-bones and sacrum of vertebrates, which constitutes the arch giving support to the lower or hinder limbs. The pelvis corresponds to the shoulder-girdle of the upper or fore limbs, and forms a cavity in which several of the abdominal viscera, and organs relating to reproduction and the urinary functions, are contained and protected. The human pelvis is formed on the sides and in front by two bones, each of which is known as an os innominatum. This, the chief bone of the pelvis, although consisting of but a single bone in the adult, is in the young state composed of three distinct bones, the ilium, ischium and pubes. These bones unite firmly about the 25th year of life to form a deep cup-shaped cavity, the cotyloid cavity or acetabulum, which receives the head of the femur or thigh-bone, and thus forms the hip-joint. To this cup the ischium and ilium each contribute two-fifths of its extent, the pubes making up the remaining one-fifth. The acetabulum shows on its lower surface a depression, to which the interarticular ligament of the hip-joint is fixed. From the acetabulum the ilium rises backward and upward, and constitutes the haunch, and thus forms the chief upper boundary of the pelvic basin. The ischium passes backward and downward from the acetabulum, while the pubis proceeds inward and forward, and joins its fellow of the opposite side to form the front wall of the pelvis. Behind, the innominate bones articulate with the sacrum—composed of several vertebrae united together in one bone—which thus forms the posterior part of the pelvis. The sacrum and coccyx belong to the spinal column. The sacrum is an irregular pyramid in shape, apex downward and jointing with the coccyx.

The pelvis is inclined in the erect attitude of man so that the plane of its brim forms with the horizontal plane an angle of from 60 degrees to 65 degrees, raising the base or upper part of the sacrum about four inches above the front. The pelvis of man differs materially from that of woman, the differences having chiefly reference to the greater capacity required for the purposes of gestation. The ilia in woman are more expanded than in man, giving to the female her noticeably greater breadth, on the average about two inches, across the hips. The pelvis of woman, as a whole, is also of lighter weight than that of man. Complicated muscular attachments exist in connection with the attachment of the pelvis to the trunk, and with that of the lower limbs to the pelvis. Deformities of the pelvis arise from

various causes, error in development, local disease, injury, new growth, etc. There are racial peculiarities in the shape of the pelvic brim. That of the Caucasian is wide transversely, while that of the negro is relatively constricted in the same sense. The study of the shape and size of the pelvis is of especial interest to obstetricians.

The pelvis varies greatly in development and perfection even in the *Mammalia*. It may be extremely rudimentary, as in whales, dugongs and manatees. In the *Mammalia* generally the pelvis is always more elongated and narrower than in man. It is much elongated in bats and insectivorous mammals; its halves being connected at the pubis by ligament only, or being, as in many bats and in moles and shrews, wholly unconnected and separate in front. In no birds, save in the ostriches, are the pelvic halves united at the symphysis pubis. In all birds, and in the porcupine ant-eater, the acetabulum is perforated. The *Monotremata* and *Marsupialia* possess what are termed marsupial bones, attached to the front of the pelvis brim or pubes. (See MAMMALS; MARSUPIALIA; MONOTREMATA). These bones are merely the ossified inner tendons of the external oblique muscles of the abdomen, which in kangaroos, etc., support the marsupium or pouch. The ischia are the most constantly represented elements in the mammalian pelvis. In turtles and crocodiles the disposition of the pelvis resembles that of man. In some snakes (for example, boas, pythons, etc.) a rudimentary pelvis exists. In all amphibians the ilium is invariably represented in the pelvis, and an ischium in all except *Proteus*. In fishes many variations exist in the degree of perfection of the pelvic elements. The ilium of fishes is almost invariably absent.

Pelvic Girdle.—In man this part of the skeleton (imperfect behind, the gap being filled by the sacrum) is formed by the two innominate bone—the haunch or hip bones. In the lower forms of animal life its construction is various. See ANATOMY; OSTEOLOGY, and consult Dorman, Franklin A., 'Deformities of the Pelvis' (New York 1916).

PELZ, pëlts, Paul Johannes, American architect; b. Seitendorf, Silesia, 18 Nov. 1841; d. 30 March 1918. Educated, College Saint Elizabeth and the College of the Holy Spirit, Breslau; at 16 removed to America whither his father had come in 1851 for political reasons. In 1859-66 he studied architecture at New York under Detlif Lienau. For many years he was connected with the United States lighthouse board as architect and civil engineer, and designed many lighthouses. He was architect of the Congressional Library building, of Georgetown College Academic Building, Carnegie Library and Music Hall Building, Allegheny, Pa., the United States Government Army and Navy Hospital at Hot Springs, Ark., the Chamberlain Hotel, Old Point Comfort, Va., Clinic Hospital, University of Virginia, Aula Christi at Chautauqua, N. Y., Machinery Hall at the Saint Louis Exposition, and many others.

PEMBA, a coralline island lying 20 miles due east of the port of Tanga, Tanganyika Territory, and about 28 miles northeast of Zanzibar. It is a part of British East Africa under the division of the Zanzibar Protectorate. It

is about 38 miles long, 10 miles broad and has an area of about 400 square miles. It is generally low with some inland hills and swampy valleys, and is well-wooded and fertile. The northern and eastern parts were until recently covered with primeval forests, which have been partly cut away for clove plantations. The Arabs call it "The Emerald Isle." The shore line of the island is deeply indented so that no part of it is far from the sea, and this serves to temper the very hot climate with continual breezes. The rainfall is about 75 inches. Malaria of a mild type is prevalent, otherwise the island is salubrious.

Pemba is notable as being the largest clove growing district in the world, having 38,000 acres under cultivation, and producing an annual crop of about 9,000,000 pounds—about 70 per cent of the world's supply—valued at nearly \$2,000,000. This industry is practically all in the hands of Arabs. There are also some cocoanut groves, but the soil is too clayey to suit them, and the climate is too moist for drying the copra. A few ceara rubber plantations have been set out, and the forests abound in the rubber vine (*Landolphia*), but the rubber production is so far insignificant. All sorts of tropical fruits grow in abundance. There were formerly great rice fields, and rice was the chief food of the inhabitants and the chief article of export. Now the principal food is the manioc or cassava (tapioca), and rice is one of the chief imports. The island is governed from Zanzibar, with which it has wireless communication, and a weekly steamer service. Chakechake (pop. 9,000), the principal seaport and town, stands on an inlet on the west coast. Pemba was transferred to the British East Africa Company in 1891 by the Sultan of Zanzibar. The capital is Weti, on the west coast, situated on the islet-fringed Bay of Weti. Pop. about 83,130. Consult Craster, J. E. E., 'Pemba, the Spice Island of Zanzibar' (London 1913); Lyne, R. N., 'Zanzibar in Contemporary Times' (London 1905).

PEMBERTON, pëm'bër-tòn, John Clifford, American soldier; b. Philadelphia, Pa., 10 Aug. 1818; d. Penlynn, Pa., 13 July 1881. He was graduated from West Point in 1837, served against the Indians in Florida in 1837-39, and took part in the settlement of the Canadian border troubles, 1840-42. He was made first lieutenant in 1842 and served under General Worth in the Mexican War, being breveted captain for conspicuous bravery at Monterey, and major for services at Molino del Rey. He continued in service in the army accompanying the expedition to Utah in 1858. At the outbreak of the Civil War he resigned his commission and entered the Confederate army. He was appointed lieutenant-colonel and engaged in organizing the artillery and cavalry of the State of Virginia in which task he was eminently successful. He was made a major in 1861, and a few weeks later was promoted to colonel, and then to brigadier-general. In February 1862 he was promoted to the rank of major-general with command of the department of South Carolina, Georgia and Florida; in October of the same year he was raised to the rank of lieutenant-general; in 1863 succeeded General Van Dorn in the department comprising Mississippi, Tennessee and eastern Louis-

iana. Here he refused co-operation with General Johnston's plans and his correspondence with that general fell into the hands of General Grant, who defeated him at Champion's Hill and Big Black Bridge, and later captured Vicksburg after a brave defense by Pemberton. His conduct excited severe criticism and after his exchange he resigned his commission, but in 1864 accepted the rank of lieutenant-colonel with command of the artillery defenses at Richmond and served until the end of the war. The remainder of his life was spent in retirement in Virginia and later in Pennsylvania.

PEMBERTON, Max, English novelist: b. Birmingham, England, 19 June 1863. He was educated at Cambridge and was one of the staff of *Vanity Fair* in 1885. He was editor of *Chums*, a boys' paper, 1892-93, and editor of *Cassell's Magazine*, 1896-1906. He has published 'The Dairy of a Scoundrel' (1891); 'The Iron Pirate' (1894); 'Sea Wolves' (1894), and 'The Impregnable City' (1895), stories of adventure; 'The Little Huguenot'; 'A Puritan's Wife' (1896); 'Gentleman's Gentleman' (1896); 'Christine of the Hills' (1897), a novel of Dalmatian life; 'The Garden of Swords' (1899); 'The House Under the Sea' (1902); 'Doctor Xavier' (1903); 'A daughter of the States' (1904); 'The Gold Wolf' (1904); 'The Hundred Days' (1905); 'Signors of the Night' (1905); 'Sir Richard Escombe' (1908); 'White Motley' (1911); 'War and the Woman' (1912); 'Behind the Curtain' (1916); 'Her Wedding Night' (1917).

PEMBROKE, pēm'brūk, Canada, town and county-seat of Renfrew County, Ontario, situated on the Ottawa River and reached by the Canadian Pacific and the Grand Trunk railroads, 100 miles north by west of Ottawa. It has several fine public buildings and contains two hospitals, woolen mills, lumber and saw mills, steel mills, building materials works, tool works, leather and leather goods works, brick yards, etc. Pembroke was once the residence of the Rev. Henry Edward Letang, the French-Canadian churchman. Pop. (1921) 7,873.

PEMBROKE, N. H., town in Merrimack County, on the Merrimack River, and the Boston and Maine Railroad, five miles south of Concord. Pembroke Academy is located here and the town also contains a soldiers' monument, monument to Josie Langmaid and a sanitarium. It has extensive interests in farming, poultry-culture, and cotton manufacturing. Pop. 3,062.

PEMBROKE, (1) Wales, a western maritime county or shire of South Wales bordered by Saint George's channel on the northwest and the Bristol channel on the south, and bounded northeast by Cardigan and east by Carmarthen. Area, 614 square miles. Capital, Pembroke. The county is diversified with hill and vale, attaining a height of 1,754 feet in the Precelly Hills; the coast is indented by numerous bays and fine harbors, chief of which is the celebrated Milford Haven (q.v.). Barley, oats and potatoes are the principal agricultural products; coal is mined and slate quarried; iron and lead mining have practically ceased. The fishing industry is important. Pop. about 90,000. (2) The capital of Pembroke County, Wales, on the estuary known as Milford Haven, 40 miles west of Swansea, and 270 miles by rail west of

London. Its principal industries are connected with Pembroke Dock, or Pater, two and one-half miles northwest, a naval dockyard and arsenal, established in 1814. This establishment comprises an area of 80 acres, and since 1861 has been fortified at a cost of more than \$2,500,000. Pembroke's most interesting edifice is its ruined Norman castle dating from 1094, in which it is said Henry VII was born in 1457. Pop. about 15,600. (3) The capital of Renfrew County, Ontario, Canada, on a southern point of Allumette Lake, an expansion of the Ottawa River, 74 miles by rail northwest of Ottawa on the Canadian Pacific and Canadian Atlantic railways. It is the see of a Roman Catholic diocese. The Muskrat River, a small affluent of the Ottawa, traverses the town and supplies water-power to the saw, grist, woolen mills, the tannery and other industrial establishments. The town has nine churches, six schools, two hospitals and three banks. It is supplied with cheap hydro-electric power from its own works, and manufactures for export moccasins, gloves, steel furniture, etc. A considerable trade in lumber is carried on. Pop. about 8,500. (4) A municipality of Leinster, Ireland, suburban to Dublin, on the southeast.

PEMBROKE (pēm'brök) COLLEGE, Cambridge, England, was founded in 1347, under the name of Valence-Mary, by Mary de Saint Paul, widow of Aylmer de Valence, Earl of Pembroke, who was killed on his wedding-day at a tilting match held in honor of the bride; she thereupon went into conventual retirement, bequeathing her estate to pious uses. King Henry VI was so liberal a benefactor to the college as to obtain the name of a second founder. There are 29 open scholarships, varying in value from \$100 to \$400 a year, and 13 open fellowships. The buildings were greatly added to and altered between the years 1870 and 1883, many of the original structures being torn down and rebuilt. The chapel, in Corinthian style, was built by Sir Christopher Wren in 1663. Among many noted alumni are Nicholas Ridley, the martyr, Archbishops Grindal and Whitgift, Spenser and Gray, the poets, and William Pitt (the younger).

PEMBROKE COLLEGE, Oxford, England, originally Broadgates Hall, was founded in the year 1624 by James I, and obtained its name from William Herbert, Earl of Pembroke, then chancellor of the university. It was endowed by the Rev. Richard Wightwick, rector of Ilsey, Berks, and by Thomas Tesdale of Glympton, Oxfordshire. The present constitution of the college, settled by ordinances of the commissioners under the statute of 1877, admits of a master, not less than 10 fellows, and of not less than 12 scholars. Some of the fellowships are at present suspended. There are in all 24 scholarships and exhibitions the value of each being from \$300 to \$500 a year. Among its distinguished alumni are Beaumont, the dramatist, Camden, the antiquary, Sir William Blackstone, Sir Thomas Browne, Samuel Johnson, John Pym, Shenstone and George Whitefield.

PEMMICAN, a food preparation of the American Indians, consisting of buffalo or venison meat, cut into strips and dried in the sun, and, after being pounded into powder mixed with fat to a paste, and pressed into

cakes. It was mixed with shad-berries, cranberries or other wild fruits and compressed in bags of rawhide. It was chiefly used on long journeys and time of war. A similar preparation made of beef under the same name is used on long Arctic expeditions, the fruit used being raisins or Zante currants. It is regarded as containing the largest possible food value for the space it occupies.

PEMPHIGUS, pēm'fī-gūs, or **POMPHOLYX**, known popularly as "bladdery fever," an affection of the skin characterized by an eruption of large vesicles ranging in size from that of a pea to a walnut, filled with serous fluid, blood or pus, and called blebs or bullæ. The disease assumes both acute and chronic forms, and appears also as a concomitant with other diseases, as syphilis. In mild acute cases blebs appear in succession, continue for several days, then break, form a thin scab, and soon heal without fever or inflammation. In severe cases there is often much constitutional disturbance, the blebs are larger, and the scabs heal with difficulty. The general health shows impairment, fever develops, and sometimes there is troublesome itching. The chronic form differs from the acute mainly by its longer continuance. The acute chiefly affects children, and has been ascribed to dentition, errors of diet, etc.; while the chronic chiefly attacks aged persons, and is probably due to debility and impaired nutrition. The acute form usually requires only cooling medicines and diet, and mild local dressings, such as simple cerate, to protect the raw surfaces from exposure to the air. In the chronic form a nutritious diet, with the judicious use of tonics (iron, strychnine, quinine, etc.), is most commonly successful. In obstinate cases arsenic is given. Sedative local applications and continuous baths in warm water are of great importance in the treatment.

PEN, an instrument for writing with a fluid. Pens have been in use from very ancient times, being made and adapted to the material upon which the written characters were to be impressed. In the earliest periods tools of steel served for writing on stone or metallic plates, and such are referred to by Job in speaking of an "iron pen." For the waxen tablets of the ancients a metallic stylus was employed, one end of which was sharpened for marking, and the other was flattened for erasing the marks and smoothing the wax, hence the phrase "often turn the pen," which was used in careful revision, with frequent erasure and rewriting. It was also the practice in ancient times, as among the Chinese at the present day, to paint the letters with a fine hair pencil. Pens of reeds were also made at a very early period for the use of a fluid ink upon papyrus. The reed selected for this purpose is described as small and hard, and about the size of a swan's quill. It was found in Egypt and Armenia; and Cairo and Alexandria were famous markets in which it was sold. Along the shores of the Persian Gulf reeds are still collected for this use, and are distributed throughout various parts of the eastern countries, being better adapted to the ink and paper employed in these regions than any other kind of pens. They are prepared by leaving them under dung heaps for several months which causes them to acquire a mixed black and yel-

low color, and a smooth and hard surface. The pith is dried up by the heat generated.

Quill Pens.—The introduction of paper rendered necessary pens of finer character, and quills of the goose and swan next came into use, and for extremely fine writing those of other birds, as of the crow, were found well adapted. A great trade grew up in these articles, and continued for several centuries. Poland and Russia were largely engaged in it, and immense flocks of geese were raised in those countries chiefly for their quills. In a single year Saint Petersburg has furnished to England over 27,000,000 quills. Germany and the Netherlands were also large producers of goose quills. From each goose the average number of good quills obtained was only 10 or 12, though sometimes they amounted to 20. As they were plucked from the wing they were soft and tough, and covered within and without with a thin membrane. They were first sorted according to the length and thickness of the barrel into primes, seconds and pinions, and were then buried for a short time in hot sand which dried the outside skin, so that it was easily scraped off, and the inner lining became shriveled and detached. This treatment was called, from having been practised in Holland, "dutching." After this the quills were hardened by dipping them into a boiling solution of alum or of diluted nitric acid, which also rendered the barrel yellow. A portion of the barbs was then stripped off, and the quills were tied in bundles for the market.

Steel Pens.—The immense consumption of quills led to the invention of the steel pens, which appeared first in England in 1803. They cost originally \$2 to \$3 each, although the price was reduced to 12 cents in the course of 10 years. No substantial advance was made in the manufacture until after the adoption of drop presses, in 1825. It was not till after 1830 that steel pens began to come into extensive use, owing to improvements introduced by James Perry, Joseph Gillott, Sir Josiah Mason and other manufacturers. The lowest-priced pens are now made almost entirely by machinery, but the finer qualities require a deal of hand labor in finishing. Up to quite recent years all the steel for the manufacture of pens was imported from Sheffield, England, and for certain makes of pens the steel is still brought from there. But American steel makers have been very successful in supplying a satisfactory 1 per cent carbon steel which answers every purpose, and the importations are very small. As it comes to the pen manufacturer the steel is in sheets about five feet long, 19 inches wide, and 23/1000 of an inch thick. This is cut into strips 19 inches long and just wide enough to cut a double row of pens, with their points interlapping alternately. The strips are first annealed for several hours, and then placed in a tumbling barrel containing a "pickle" of dilute sulphuric acid to remove the scale of oxide. The strip is then cold-rolled by successive reductions to a thickness of 9/1000 of an inch—requiring about 20 passes through the rolls. For some special pens the thickness required is but 2/1000 of an inch. The sheets are most carefully gauged, the maximum variation permitted being 1/4000 of an inch. The strips are passed into the hands

of a girl, seated at a press, who, by means of a die and punch corresponding, cuts out pieces the shape of the pen, called blanks at the rate of 40,000 per day of eight hours, some 200 different styles of dies being required to produce the variety demanded by the market. The next stage is called piercing, which is cutting out by a punch the central hole in the nib, and at this stage also the lateral slits are cut. The metal has become through the repeated rolling and stamping so hard that it is necessary to anneal it. This is effected by placing the blanks in cast-iron pots, and raising them to a red heat in a muffle-furnace, afterward leaving them to cool slowly. Up to this stage the blank is a flat piece of steel; it is now stamped with the maker's name and the number, and is then passed to the raising-press, where it is rendered concave by being pressed into a groove by a sinker. The next process is hardening, which is done by heating the pens to a red heat in an iron box or muffle, and then plunging them in oil. The process of tempering follows; and then they are scoured and cleaned by immersion in soda water and dilute sulphuric acid successively, and by friction in a tumbling barrel with sand and similar solid substances. The outside of the nib is then ground first lengthwise and then crosswise, which is done by different persons upon separate emery grinding-wheels. Next comes the most delicate operation, cutting the central slit, upon the nicety of which a great part of the value of the pen depends. The pen is placed lengthwise on a chisel fixed in the bed of a shearing machine; the descending lever carries another chisel, which passes down just clearing the other with the minutest accuracy. The points of the tip are now very sharp and jagged: they are smoothed by being tumbled in pots for 30 hours with granulated fire-clay bricks. They then go to the inspectors' tables which are of black glass. Here each pen is scrupulously examined by an expert for accuracy of cutting, piercing, marking, raising, grinding, slitting, tempering and finish of point. Those which are passed as perfect are then polished in buffing boxes. If they are to remain their natural steel gray color they are at once lacquered. Or they may be plated with gold, silver or bronze. Or they may be colored brown, black or blue, by being heated in a revolving metal cylinder over a charcoal stove, and removing them when the desired tint is attained; they are then varnished by lac dissolved in naphtha. After being dried by heat they are counted mechanically into small boxes ready for the market. A large proportion of the cheaper grades of steel pens are now made on automatic machines which turn out the finished pens ready for lacquering. The annual production of steel pens in the United States is about 3,000,000 gross. About one-sixth of the total output is exported.

Gold Pens.—The gold pen is an American product and the world's supply is practically manufactured in New York. In 1823 John Isaac Hawkins, an American, residing in England, imbedded pieces of diamond and ruby in the points of tortoise shell pens, which were softened in water to receive the stones. The same manufacturer, hearing that bits of an extremely hard native alloy of iridium and osmium, sent by Dr. Wollaston to a penmaker to

be used for points, had been returned as too hard for working, obtained these for his own experiments and was the first to produce the famous "diamond points" soldered to gold pens. The manufacture of these pens made but slow progress, great skill, the result of long continued experiments, being necessary to produce the exact shape suited for the required elasticity of the pen and to combine this with the proper size and form of the points. They were moreover costly as well on account of the metal employed as the labor expended in the manufacture. The right to make gold pens was purchased of Hawkins by Dr. Cleveland, an American clergyman then in England, who on his return induced Levi Brown, a watchmaker in Detroit, to undertake their manufacture. This was about the year 1835. The experiment was attended with little success. Brown removed in 1840 to New York and there introduced the business, which gradually increased in importance as the quality of the pens was improved and the price diminished by their more rapid production. At first the pens were cut with scissors into shape from a thin flat strip of gold and a slit being cut in the nib a bit of iridium was soldered to each point separately and the points were then rounded up into shape with a mallet upon a stick. The inferior pens thus made by hand sold for \$5 to \$10 each. The first machines and almost the only important ones in use applicable to the different branches of this work, were invented by John Rendell, who systematized the process, giving to each workman his peculiar branch and thus a nicety and certainty of good work were attained by each one which was essential to the perfection of the pen. In the process now in use the pure gold as it comes from the United States Assay Office is melted and alloyed with with copper and silver to a 14-carat degree of purity. It is then cast in the form of a bar which is rolled into strips 1.32 of an inch in thickness. The blanks are stamped out on a screw press. A notch is cut in the tip of each blank and a bit of iridium soldered in to form the wearing point. The pen is then "marked" with the maker's name, and curved to proper shape in a suitable press. The tip is then slit at the exact centre by a revolving copper disc coated with emery. The pen is brought to its desired shape and flexibility by grinding on copper wheels fed with emery and finally polished on buffing wheels coated with rouge. The pen then goes to an expert penman who tests its writing qualities and corrects any defects by regrounding with emery.

Fountain Pens.—From about the middle of the 19th century various attempts were made to construct fountain pens, that is, pens fitted with an ink reservoir from which the point is supplied by capillary or other action. The fountain pen now in use by the millions was the invention of Lewis Edson Waterman in 1883. It is a combination of a rubber barrel and a gold or gilded pen. The completed article as it appears in the market has passed through 210 distinct operations between the crude materials and the finished product. The making of the gold pen has been described above. The larger fountain pen factories make their own pens, but in some plants only the barrels are made and gold or gold-plated pens are bought from

the pen makers and assembled by the fountain pen manufacturer. In making the barrel the crude rubber "biscuits" are sliced and ground up, the dirt being washed out by jets of water during the process. For 10 or 12 days the rubber is dried and cured in an oven kept at 135° F., and is then mixed with about one-third of its weight of sulphur in a mixing mill. From this the mass is passed through the sheeting rolls and the sheets are then cut into strips of two widths to form the barrel and the cap. These strips are delivered to workmen who sit at heated tables of polished steel and who roll the strips on small cylindrical mandrels and when the rubber is of the proper thickness wind both rubber and mandrel with metal foil. They are then packed in powdered soapstone in steel boxes, which are placed in a vulcanizer and kept at a temperature of 300° F. for 14 or 15 hours. A certain elasticity being required in the finished barrel, the vulcanizing must not be carried too far. After cooling, the cap and barrel are hand turned in a lathe, the barrel being tapered at both ends to fit the cap. Threads are cut for the "spoon" which feeds the ink to the pen; the ink fissure is routed out; and the air vent is bored. The parts are then in the rough and have to be polished on a cotton wheel buff coated with rouge. The chasing of the barrel is done with a diamond. The latest improvement in the fountain pen is an automatic filler, or, to be more exact, a device for filling the pen without removing the part containing the pen from the ink-reservoir, the ink being drawn through the pen, which is dipped into the well or bottle. Still another improvement is the screw force feed which overcomes the drawback experienced in the older models of the clogging of the ink channel through drying. The force feed is reversed to fill the pen. The annual production of fountain pens in the United States alone is between 7,000,000 and 8,000,000.

The Pen Industry.—Pens are now made in almost endless variety as regards shape and size, character of point, etc., as many as 2,000 distinct sizes and styles being offered by makers. The great centre of the manufacture is Birmingham, England, where more than 20,000,000 pens are turned out every week. France and Germany also manufacture steel pens and New York leads in the gold pen production of the world. Some idea of the growth of the pen industry may be obtained, therefore, when it is known that in 1860 nearly all the pens consumed in this country were of foreign manufacture. In 1860, Richard Esterbrook, his son Richard and James Bromgrove founded a pen factory at Camden, N. J. The business was a success from the start and in 1866 the firm was incorporated as the Esterbrook Steel Pen Company. In 1880 not more than \$10,000 were invested in the pen industry. Besides the Esterbrook company, prominent pen manufacturers in the United States are Miller Brothers, Meriden, Conn.; Turner and Harrison and Malpass and Company, Philadelphia; and the Eagle Pencil Company; A. S. Barnes Company and Jos. Gilloft and Sons, New York.

According to the 1914 census of manufactures there were in the United States in that year, engaged in the manufacture of steel pens, five establishments with an aggregate capital of

\$870,601, employing 243,043 hands and with an output for the year valued at \$513,498. There were 12 establishments making gold pens, having a combined capital of \$408,228, employing 174,209 hands and turning out a product valued at \$642,461. There were also 55 establishments making fountain pens and stylographs, with \$3,269,809 capital, employing 717,533 hands and a product valued at \$6,865,074.

PEN ARGYL, *pën är'jil* (Welsh, *Argyl Head*), Pa., borough of Northampton County, on the Bangor and Portland and the Lehigh and New England railroads, 20 miles north of Easton. Its industrial activities include shoe factory, planing mill and several slate quarries. Pop. 4,096.

PEN-STIPPLE. See LITHOGRAPHY.

PENA, *pā'na*, **Carlos María de**, Uruguayan diplomat: b. 1852. In 1876 he received the degree of doctor of laws and social sciences at the University of Montevideo. From 1885 to 1911 Señor de Pena held the chair of political economy and administrative law at the University of Montevideo, where also he served as dean of the School of Law and Social Sciences. He was mayor of the city of Montevideo in 1889-90. He also was Secretary of the Treasury and Minister of Public Works, Industry and Public Instruction in the national government. In 1907 the government despatched him to a confidential mission to Brazil; in 1911 he was delegate to the Pan-American Conference at Buenos Aires and in the same year was named Uruguayan Minister to the United States. His published works include several volumes on the commerce, education and industry of his native land.

PEÑA, *Rogue Saenz*, Argentine president, son of Don Louis Saenz Peña, also President of Argentina: b. Buenos Aires, 19 March 1851; d. there, 9 Aug. 1914. His education at the law school of the University of Buenos Aires was interrupted by service in the army while a revolution was being suppressed, after which he completed his course. He was elected to Parliament in 1876 and in the following year became president of the Chamber, but resigned to offer his services to Peru in the war between that country and Chile in 1879-83. He was wounded and captured, but was released before the end of the war and returned to his own country. He was under-secretary for foreign affairs in 1881; and in 1882 was one of the founders of *Sud America*. He was appointed Minister to Uruguay in 1882; was a delegate to the first International Congress of American States in 1889-90; and was Minister of Foreign Affairs in the Cabinet of Juárez Celman in 1890. In 1906 he was appointed ambassador to Spain, and he was ambassador to Italy in 1907-10. He was elected President of Argentina in 1910, on a platform of agrarian reform. His administration was marked by the establishment of cordial relationships between Argentina, Brazil and Chile, resulting in the A. B. C. Entente. His work greatly strengthened the unity of the Latin races in America as well as fostered good feeling between his country and Spain and Italy. He died in office.

PENALTY, (1) Originally, a punishment inflicted, as for violation of the law; common in the phrase "death penalty." (2) A sum of

money agreed to be forfeited in case of non-performance or breach of a condition, as in a contract. A penalty, unless damages are uncertain or unless agreed upon as liquidated damages, will not be enforced either in a court of law or of equity. The language of the contract is not conclusive, and if the parties call it a penalty and it appears to be the amount of damages they believe will ensue from a breach, it will be enforced. (3) A sum of money recoverable by virtue of a penal statute for violation of its provisions.

PENANCE, a theological term, signifies first, a virtue, or condition of mind; secondly, an outward act or series of acts, expressive of the mental condition; thirdly,—according to the Catholic conception,—a sacrament; all having to do with the forgiveness or atonement of sin. The three various phases are not considered as independent, separate means for obtaining remission of sin, but as supplements, one of another: the penitential spirit is the primary necessity; the penitential exercise is the natural and obvious manifestation of the interior state of soul; and the sacrament is not a substitute for either the virtue or the act, but a complement of both. The necessary brevity of this article will allow only a most summary treatment of the virtue and only such mention of the penitential discipline as may come incidentally in the treatment of the main subject, the sacrament of penance.

1. "Penance," the virtue, is synonymous with "repentance," "contrition," and such other terms as express sorrow for sin as an offense against the law and the person of God. All Christian theology agrees that without repentance of heart there can be no remission of sin. But as to the precise nature of this sorrow there is dissension. According to the Augsburg Confession (Art. XII), "Repentance consists of two parts; one is contrition or terrors stricken into the conscience through the acknowledgment of sin; the other is faith that for Christ's sake sins be forgiven." The Council of Trent, teaching the Catholic doctrine, quotes the Lutheran definition, condemns it as insufficient and explains that for true repentance there must be not only present "contrition or terrors," with "faith," also a look into the past and a provision for the future; there must be "sorrow of mind, a detestation of past sin and a determination of not sinning for the future." (Sess. 14, ch. 4.) However, Trent recognizes a distinction between perfect and imperfect contrition; that contrition is perfect which is motivated by love of God, that is imperfect which is begotten of fear of the punishment due to sin. The former, sorrow for sin for God's sake, of itself immediately remits sin, even without sacramental absolution, provided it be accompanied by at least an implicit willingness on the part of the penitent to make use of whatever means God may have provided for the receiving of formal forgiveness. Furthermore, even by use of the sacrament, no one can possibly receive forgiveness unless he have at least the sorrow that comes from fear.

2. **The Sacrament of Penance.**—Any discussion about the existence of the sacrament may be narrowed down into an attempt to answer the question: did Jesus Christ, as the founder of a new religion, establish an institution for continuing visibly and through human instru-

mentality one of the chief works of salvation, the forgiveness of sin after baptism? Anyone, it would seem, who at all admits the sacramental idea in the Christian religion—who accepts, for example, the fact of baptismal regeneration, cannot logically maintain, *a priori*, the impossibility of the existence of a sacrament for the forgiveness of post-baptismal sins.

And indeed, whether there is or is not such a sacrament, is a question of historical fact rather than of theological theory; and the answer to the question must come from an examination of historical evidences.

The scriptural texts, offered as witness of the foundation of a special "ministry of reconciliation," are three: St. Matt. xvi, 18, xviii, 18, and St. John xx, 22 and 23. In the two former passages, Christ is represented as bestowing, first upon Saint Peter and then upon all the apostles, the power of "binding" and "loosing," and as promising that their exercise of that power should be ratified in heaven. The precise meaning of these two texts is not immediately evident: it may justly enough be maintained that, taken alone, they give no certainty of a delegation of the power of forgiving sins. It has been pointed out that "to bind" and "to loose" are formulæ of rabbinical theology meaning, "to prohibit" and "to permit"; hence a mere exegesis of these texts may show only that a general legislative and judicial power was granted to the apostles. But the supplementary passage of the Fourth Gospel apparently specifies one of the ways in which the general prerogative of binding and loosing is to be exercised. Saint John pictures the Lord solemnly praying over the apostles, breathing upon them in token of the imparting of the Holy Spirit, sending them forth, as He Himself had been sent forth from the Father and transferring to them His own divine prerogative of forgiving and retaining sins.

Taking the three texts together, it can scarcely be denied that even in their narrowest significance they witness the imparting of an authority to the Christian church to forgive and to retain sins in Christ's name.

This fact is not generally disputed. Protestants as well as Catholics maintain that the Church possesses and exercises the power of forgiving sins. The discussions have rather concerned the question, Who are the repositories of the pardoning power and what are the means by which it is exercised?

The Protestant party in the controversy declares that the power was bestowed not upon the apostles alone,—and hence not upon bishops and priests alone,—but upon the whole Christian church in general; and that the church exercises its power by conveying the "good tidings" to the world, by preaching and baptizing.

Catholics answer that such theories ignore the details of the incidents recorded in the texts of Saint Matthew and Saint John, which show that only the apostles were present when the Lord gave the commission of binding and loosing, of forgiving and retaining; that it is extremely unlikely that so wonderful a prerogative should have been conferred indiscriminately upon all; that to say sins are forgiven only by means of preaching and baptizing is to forget the discretionary and judicial character of the process which permits "binding" as well as

"loosing," "retaining" as well as "forgiving." Such, in a word, is the status of the controversy concerning the exegesis of the scriptural texts.

But all parties concerned are agreed that a further and perhaps securer interpretation of the Lord's words is to be sought in an examination of the history of the early church; and, in fact, the vast bulk of modern discussion on the sacrament of penance has dealt with history rather than with exegesis. The adversaries of the Catholic position have, in this case, showed an unusual willingness to appeal from Scripture to Tradition. Catholic scholars, in turn, are no less confident of the outcome of a historical investigation of the origin of penance; but before undertaking it, they make certain provisos.

They are not loath to admit that the present very exact theology of the sacrament was by no means understood in all its details in the primitive church and that the modern discipline of the administration of penance is the outcome of a long process of — so to say — experimentation. For explanation of the divergences between the ancient and the modern practice and of the immense advance in certainty of theoretic understanding of the doctrine, they appeal to the principle of theological developments claiming for the sacrament of penance the same right to legitimate evolution which is acknowledged for all other Christian institutions. Starting with the essentials once necessarily determined by Christ, namely the forgiveness of sin by men judging in His name and absolving by His authority they are content if they can show by a recourse to historical documents that the nature of the sacrament was sufficiently clear, in its general outlines, from the beginning; that the forgiveness of sins from earliest Christian times was understood to be consequent upon sorrow of heart, acknowledgment of guilt, — either in the church publicly, or to a bishop or a priest privately, or both, — the performance of some penitential discipline and the pronouncement of reconciliation with the church and with God, by the president of the Christian assembly, the bishop, or his delegated priest. Here, in theological terms, are contrition, confession, satisfaction and absolution, the essentials of the sacrament. All else may vary and be doubtful, conditions and processes of administering and receiving forgiveness may change, the relative value of the constituent parts of the sacrament may be but obscurely understood, the positive and absolute obligation of confessing may not be universally defined until late in the history of the sacrament, public manifestation of conscience may be found inexpedient and private confession, instead of being an accompaniment or preparation for public confession, may survive alone; standards of discipline regulating the receiving of penitents and the imparting of absolution may vary from the extreme of severity to the extreme of leniency; along many lines there may be only a gradually increasing certainty of doctrine and a gradually crystallizing form of discipline, but, say the Catholic apologists, provided it can be shown that in details only and not in essentials, doctrine has been clarified and discipline changed, all this involves no incompatibility with the present teaching and practice of the Church.

Such is the viewpoint from which the de-

fenders of the sacrament look upon the historical data, of which a very short summary may here be given.

The first historical evidence of confession in the Early Church is in the Acts of the Apostles (xix, 18). The converted Ephesians "came confessing their sins," evidently not in secret or to God alone, but publicly in the assembly; and not in general terms only, but in some detail "declaring their deeds." And the first clearly recorded instance of the exercise of the absolving power is the "binding" and the "loosing" of the incestuous Corinthian by Saint Paul (1 Cor. v, 5 and 13; 2 Cor. ii, 10).

Before the end of the first century, Saint Clement of Rome is recorded as urging penance in this world, because "there can be no *confession* or repentance in the other" (Ep. 2 and Cor. 8); and during the first half of the second century, the Didaché twice speaks of public confession in the Church. Any further information concerning the nature of these confessions, whether they were liturgical or sacramental, detailed or general, is not vouchsafed by the documents. They cannot, therefore, witness anything further than the fact that there was some kind of public confession in the Church of the 1st and 2d centuries.

Evidently this is meagre evidence, but explanations are given as to why it could not well be more explicit and satisfactory; first the extreme paucity of the documents of primitive Christian literature, and second the undoubted predominance in the sub-apostolic Church of a spirit and tendency which precluded the possibility of much direct advertence to an institution having to do with the forgiveness of sin committed after baptism. The theory was that there should be no such sin. "He who has received remission of his sins" (in baptism) "ought not to sin any more, but live in purity," says Hermas Pastor (Comm. 4, ch. 3). The conception of the Church as a community of saints, the deep-seated expectation of the second coming of the Lord, the intense realization that baptism brought with it an eternal adjuration of evil, all made the commission of sin after the first regeneration a thing almost unthinkable, and while this idealism reigned, there could be only a kind of subconscious attendance to the existence of the sacrament of penance, and its use, in consequence, seems to have been almost in abeyance.

To such an extent did this kind of apocalyptic spirit predominate in the Early Church, that there was an uncertainty as to the method of treating sinners who, in spite of the theoretic impossibility, did actually lapse after baptism. At first they were in some places, and perhaps even at Rome, denied readmission to the Church. A too literal acceptance of the words, "It is impossible for those who were once enlightened and have tasted of the heavenly gift . . . if they shall fall away, to be renewed unto repentance (Heb. vi, 4ff.) led to a general belief that at least some sins were beyond the pardon of the Church (consult Hermas, Justin M., Dialogue, 44; Didascalia, ch. 5; Origen, De Orat. 28). But such a misunderstanding could not last. The Pastor (150 A.D.), after recording that "some teachers maintain that there is no other repentance than that which takes place when we descended into the water

and received remission of our former sins," pleads for *only one* further opportunity for repentance. (Comm. 4, n. 3). Gradually the plea of the Pastor obtained recognition, its views were adopted by Dionysius of Corinth and Clement of Alexandria, and began to prevail, though against much opposition and some setbacks.

But alongside the movement toward a milder and saner discipline, there developed a conviction that at least the three capital crimes, murder, apostasy and adultery, were beyond forgiveness in this world. There are indications, however, that ultimate pardon from God for such sins was not despaired of; the guilty were recommended to do penance and to pray for pardon; but the Church refused to readmit them to her communion. Around this point of discipline the battle was again waged for and against relaxation.

Tertullian, in his tract, *De Pœnitentia* (204 A.D.), affirms as a fact always recognized that the Church forgives sins, but maintains that repentance avails only once after baptism, there is a "second plank" of salvation after shipwreck but no third; and he not only accepts but adds to the list of "irremissible sins."

Pope Callistus (208-222 A.D.), however, following the primitive discipline observed by Saint Paul, absolved adulterers, but was roundly blamed for doing so, by Tertullian, now become a Montanist. (*De Pudic.* ch. 1). Still the milder discipline prevailed not only at Rome but at Carthage and Alexandria. In the latter city, Origen (184-253 A.D.) frequently declares in most explicit terms the doctrine of confession to the priests, absolution and renewal of repentance.

The Decian persecution (249 A.D.) turned the discussion upon the question of the pardon and readmission of apostates. Saint Cyprian, in the Council of Carthage (251 A.D.) declared the lawfulness of reinstating them, sent the reports of the proceedings to Pope Cornelius, and received his approval. Thereupon the schismatics, Novatian in Rome and Novatus at Carthage, anxious for a *casus belli*, started a reactionary movement, and maintained that apostasy and other heinous sins were unpardonable; and their followers, in the two succeeding centuries, finally went to the extremity of denying to the Church the power of forgiving any mortal sins whatever. They raised the cry—now first heard in Christian history—"God alone can forgive sins," and thereby first demanded of the Church a systematic theological defense of the right she had long been exercising.

The reply was ready and decisive and came from all quarters. In Spain, Pacian (4th century) answers the Novation objection almost in the words of modern theology; God alone has the right to forgive sins, but He has been pleased to delegate His right, not to the Church in general but to the bishops, and the forgiveness of sins in penance is to be compared with that in baptism. In Italy the pseudo-Augustine and Saint Ambrose proclaim the same doctrine and use the same comparison. In Africa, Saint Augustine repeats the objection, and refutes it by an appeal to Matthew xvi, 18, interpreting the power of the keys as a power to forgive sins, granted primarily to Peter and his successors. In Constantinople, Gregory Nazianzen

affirms the ancient and traditional rights of the bishop to forgive sins; and the Eastern Church generally was remarkable for its antagonism to the Novatian doctrine.

Thus, when the first real necessity arose, the latent theology of the sacrament came to the light, and the consensus of the Christian world was definitely expressed.

Further than this, the strife against Montanism and Novatianism elucidated not a few of the details of the doctrine; the actual necessity of the sacrament for the forgiveness of post-baptismal sin now was explicitly stated; the institution by the Lord himself was directly taught from the exegesis of the texts of Saint Matthew and Saint John, the designation of the bishops and priests as the legitimate possessors of the power of absolution was insisted upon, and in general, under the stimulus of opposition, the unfolding of the consciousness of the existence and the nature of a "ministry of reconciliation" went on apace.

Two questions of special interest may perhaps best be inserted here, before mention is made of the later phases of the theological development:

1st, the origin of *private*, or *auricular confession*: Some scholars, generally non-Catholic, have thought that private confession began in the monasteries, and thence was substituted for the public discipline. Others are inclined to think that auricular confession had its origin under Leo the Great (about 445 A.D.). Neither opinion seems to have the support of the documents. The Church historians, Socrates (H. E., 5-9), and Sozomen (H. E., 7-16), narrate the abolition of the office of private confessor at Constantinople, in the year 391, but both say that in their day, private confession was already an ancient custom. Socrates is of the opinion that it dates at least from the year 251, but Sozomen declares its origin is so far back in history that he dares not venture to name a date positively. Saint Cyprian (250) speaks of penitents confessing to the priests and the bishop (Ep. 58, 15), and Tertullian uses words indicating that private confession was in vogue in the beginning of the 3d century (*De Pœn.* x, 7 and 8); and even as far back as the first years of the 2d century there is, in Saint Ignatius (ad. Philad. viii) a possible reference to the private recourse of a penitent to his bishop. And in general, indications of the practice of private confession of smaller sins, and even of grievous sins for the purpose of receiving a preliminary judgment upon the necessity of exposing them publicly, are to be found in almost all the documents that have been cited as containing information on the ancient use of penance.

2d. The question as to the *sacramental character* of the penitential institution is evidently not to be answered by showing that there is no connection of the word *sacrament* with that of *penance* until late in the history of the Christian Church. This is admitted. But if without actually using the name, Christians believed and understood that penance was instituted by Christ, and that its purpose was to confer the grace of Christ by use of an outward form, this is sufficient to justify its title to the name *sacrament*, at least in the mind of the Church which applies the name to it.

To return to the general line of the historical description: in spite of the very definite theological teachings evoked by the Novatian controversy, it must not be imagined that the entire doctrinal theory of the sacrament was everywhere adequately understood. There was still abundant room for the expression of varying opinions. Saint Augustine, though in one place he seems to hint at the absolute necessity of absolution for the salvation of sinners, exclaiming, "what ruin will come upon those who depart this life unabsolved" (Ep. 180), does not, however, deny the possibility of their obtaining mercy from God. (Ep. 54). Likewise Cyprian, refusing absolution to "deathbed penitents," has no fear that they are by his action excluded from forgiveness forever, and in fact, all through the Middle Ages, and even down to the 13th century, we still find discussions, for example, in the Decrees of Gratian, and in the "Sentences" of Peter Lombard concerning the precise purport of absolution, and its relative efficacy compared with the necessary interior contrition. Again, the Council of Chalons in the 9th century evidently considered the absolute necessity of confession an open question, though the Synod of Liège, in the 8th century, anticipated the fourth Lateran Council of the 15th century by commanding annual confession. In fact the dogma has, like every other, a history full of controversies, doubts, reactions and advances, all looking to precision of theological thought and utterance.

Evidently, then the conclusion to be drawn from any historical examination into the origin and growth of the institution of penance must largely depend upon the acceptance or rejection of the principle of development in theology. The investigator who would expect to find at every stage of Christian history the precision and fulness of the Tridentine decrees on the sacrament of penance, or not finding them, would condemn the institution as unChristian, will doubtless be compelled to the latter alternative; but if one is willing to admit that an institution may have been founded by Christ for continuing, in a visible, sacramental way, the forgiveness of sins, and that this institution may have undergone a natural and divinely directed development, eliminating errors, fixing truth and finally settling into definite theological shape—it is quite possible that to such a one the Catholic claim may seem well sustained by historical investigation. Such, at least, is the contention of modern apologists for the sacrament, who recognize that their task is not so much to show that confession, absolution and penitential satisfaction have always existed in the Church—for this is sufficiently evident,—but that the modern discipline and doctrine are a lawful evolution of the seed planted by Him who said to His apostles, "As the Father hath sent me, I also send you . . . whose sins you shall forgive they are forgiven them, whose sins you shall retain, they are retained." (Saint John xx, 21–23).

The Roman Catholic doctrine of the sacrament of penance is shared by the schismatical churches: the Greek Church, separate from the 11th century, and the Nestorians, Jacobites and Abyssinians, separate from the 5th and 6th centuries, practise penance and hold it a sacrament.

Luther long wavered before rejecting confession and priestly absolution, as the Augsburg Confession and the Shorter Catechism testify. Even yet a limited confession is recommended in the Lutheran prayer-book, but the notion of absolution is gone. In general the reformers abolished the idea of the necessity of confession and the efficacy of absolution, though in many cases they recommended a voluntary partial manifestation of conscience. Members of the Anglican Church are coming quite generally to adopt and even to go beyond Dr. Pusey's very nearly Roman views. Some even admit the sacramental character of penance; though few, if any, have thus far considered its reception as obligatory and necessary for salvation.

Among Catholics in modern times there has been manifest a growing tendency to a devotional use of the sacrament. The law of the fourth Lateran Council (1215) prescribing annual confession for all members of the Church has merely decided the minimum of observance. The authoritative approbation of the confession of venial faults by the Council of Trent has immensely promoted the movement for frequent confession, and to-day the confessional is used to a great extent by the devout as a means of receiving "direction" for the conduct of the spiritual life, and all Catholics generally, whether or not conscious of grievous sin, always seek absolution before receiving the sacrament of the Eucharist.

JAMES M. GILLIS, C.S.P.

PENANG, pē-nāng', or **PRINCE OF WALES ISLAND**, a small island of the Straits Settlements, belonging to Great Britain, lying at the north entrance of the Straits of Malacca, off the west coast of the Malay Peninsula, from which it is separated by a channel two to 10 miles across. The length of the island is 14 miles; breadth, 8 miles; area, about 106 square miles. The settlement of Penang also includes province, Wellesley, a long strip of the Malay Peninsula opposite the island, 45 miles long by eight and one-half broad; area, about 280 square miles; and the Dindings, which include the small island of Pangkor, off the coast of Perak, and a small strip of the mainland opposite, area about 13 square miles. The greater part of province Wellesley is fertile plain, and the remainder, about one-eleventh of the whole, consists of low wooded hills, the highest of which reaches a height of 1,843 feet. Two-fifths of Penang is plain, and the rest hills—for the most part wooded—which rise to a height of 2,734 feet. The climate is hot, but healthful; bracing sea-breezes blow every day, and rain falls every month during the year except January and February; temperature from 76° to 90° F. The rocks are granite and mica schist; the soil a rich vegetable mold. The settlement produces sugar, rice and cocoanuts in abundance; together with gambier, coffee, arecanuts, ginger, pepper, cloves, sweet-potatoes, pineapples, shaddocks, bananas, oranges, lemons, plantains, mangoes, guavas, etc. Among timber trees are the teak, dammar-pine, caoutchouc, cypress, etc., and valuable gums and resins. Tigers, civets, wildcats, monkeys, wild oxen and hogs are natives, as are also pelicans, pea-fowl, adjutants (a kind of stork) and numerous species of brilliantly plumaged birds. Buffaloes and cattle are extensively raised for

dairy or farm purposes, and hogs in great numbers by the Chinese for food. Goats and sheep are scarce, but poultry is plentiful. The coasts abound with fish, 20 varieties of which, chiefly caught by the Malays, are brought to the market. Tin-ore is abundant, but little wrought. George Town, or Penang, as it is generally called, the capital and port of the settlement, is situated on a tongue of land on the east side of the island. Pop. about 105,000, principally Chinese, many of them merchants and shopkeepers. The capital has an iron pier for steamers, and a large dry-dock. There is a steam ferry to Kuala Prai in province Wellesley whence a railroad extends into the interior. The exports in 1915 were valued at \$60,061,280, and the imports at \$67,063,065. The Dindings commerce is reported separately and amounted to: Exports, \$330,070; imports, \$418,130. The population of the whole settlement is estimated at 294,858. Penang was made over by treaty to the East India Company in 1786 by the Sultan of Kedah, and renamed the Prince of Wales Island. In 1805 it was erected into a separate presidency. Since 1867, with Singapore and Malacca, it forms a crown colony with a common governor, Penang and Malacca having each a lieutenant-governor. See STRAITS SETTLEMENTS.

PENATES, pē-nā'tēz, a group of household deities revered by the ancient Romans as guardians of the food supply—particularly of the storeroom and kitchen. They were without distinctive names, but each family was believed to have a separate deity belonging to the group, and in honor of which a flame was always kept burning on the kitchen hearth. It was customary also with the devout to make a burnt offering of a part of each meal in recognition of the protection and supply afforded. The images of these gods were kept in the penetralia, or central part of every house. The Lares were included among the Penates. Since Jupiter and Juno were regarded as the protectors of the family, these divinities were worshipped as Penates; and each hearth, as the symbol of domestic union, had also its Vesta. There were also higher groups of Penates who guarded the towns, and still higher who were supposed to watch over the prosperity of the state. The chief Penates at Rome were those that protected the empire. See LARES.

PENCIL, a small pointed brush used for painting, drawing and writing. The first drawing implements used by artists were probably crayons of colored earth or chalk cut into a form convenient for holding in the hand. With such instruments the monochromes, or one-colored pictures, of the Egyptians and Greeks were drawn. On the introduction of wet colors, however, delicate brushes of fine hairs were used. Pencils of this kind, and of various degrees of fineness, are almost solely used by painters for laying on their colors in water-color work, and occasionally for oil painting, but in China and Japan they are employed, instead of pens, for writing. The cheaper sorts are used in medicine for outward applications. The hairs used for these pencils are obtained from the camel, horse, badger, squirrel, sable, goat and one particular grade is made from the very delicate hairs from the inner ear of the ox. The finest pencils require very careful

selection and arrangement of the hairs; their naturally fine points must all be in one direction; the central one must project the farthest, all the others receding in succession, so as to form a smooth cone terminating in a sharp point. The hairs, being selected, are bound in a little roll by a string tied tightly round their root ends; the points are also temporarily bound together. The roll is then introduced into the large end of a quill tube, which has been softened by moisture, and pushed through to the smaller end to a snug fit. As the quill dries the increased pressure caused by its contraction holds the hairs securely in their place; but the pressure should not be so great as to make the points spread apart when they are untied. For larger pencils a socket of tinplate or aluminum is used instead of the quill. Black lead pencils for writing or drawing, are made of graphite or plumbago. See LEAD PENCILS.

PENCIL-TREE, or **GROUNDSEL BUSH**, a branching glabrous shrub (*Baccharis halimifolia*), of the order *Compositae*, and belonging to the thistle family. It is found, 3 to 10 feet high, common along the salt marshes and tidal rivers of the Atlantic Coast, from Massachusetts southward, and also along the Gulf Coast of Texas. It is frequently seen along the shores of Cuba and the Bahamas. Its brightly white pappus makes it very conspicuous in autumn.

PENCK, pēnk, Albrecht, German geologist and geographer: b. Leipzig, 1858. In 1878 he traveled over northern Germany and Scandinavia. He made several careful studies of the Bavarian and Tyrolean mountains in 1880 and later traveled in the Pyrenees and in the mountains of Scotland. He served as docent at Munich for some time, and in 1885 was appointed professor of physical geography at Vienna. He edited the 'Geographische Abhandlungen' in 1886 and contributed extensively to the *Geological Journal* of Chicago. In 1892 he was made president of the central commission for the study of the geography of Germany. He has written 'Die Vergeltung der deutschen Alpen' (1882); 'Die Eiszeit in den Pyrenäen' (1884); 'Der Flächeninhalt der Österreichisch-Ungarischen Monarchie' (1889); 'Morphologie der Erdoberfläche' (1894), and he was joint author with Bruchner of 'Die Alpen in Eiszeitalter' (1901).

PENCO, pān'kō. See CONCEPCION.

PENCZ, pēnts, Georg P., German painter and engraver: b. Nuremberg, about 1500; d. 1550. He probably was a pupil of Dürer and became a member of the Painters' Guild in 1523, but in 1524 he was tried for heresy and compelled to leave the city, together with his friends, Hans and Barthel Beham. He, however, returned in 1525 to the neighborhood, and after a visit to Rome, once more took up his residence in Nuremberg in 1532. Here he was given numerous commissions by the city council. In 1539 he again went to Rome to study Raphael and the Venetian masters and while there studied the art of engraving under Marc Antonio. He ranks next to the Behams among the 'Little Masters' and some of his plates equal if not surpass those of his teacher, Antonio. Among them are 'The Taking of Carthage' (1539); 'The Six Triumphs of Petrarch'; 'Life of Christ' in 26 plates; 'Medea'; 'Vergil

and the Courtesan'; 'Paris,' and several portraits, the best of which is that of John Frederick, elector of Saxony. As an engraver he is considered as second only to Dürer. In his time he was called the best portrait painter in Germany. His paintings are mostly portraits and are among the best of those in the Germanic Museum, Nuremberg. He painted 'Saint Jerome' (1544); 'Field Marshal Sebaldus Schirmer' (1545), both in the Germanic Museum; 'Young Man' (1534); 'The Painter Erhard Schwetzer' (1544), and his 'Wife' (1545); all in the Berlin Museum; the 'Young Man' (1543) in the Vienna Museum, and the masterly portrait of a 'Scholar' in the Karlsruhe Gallery. His 'Adoration of the Magi' is in the Dresden Gallery; his 'Judith with the Head of Holofernes' in the Schleissheim Gallery, and his 'Crucifixion' in the Worlitz Gallery.

PENDENNIS. This novel by William Makepeace Thackeray was completed in 1850; it is great in virtue of the sincerity and justness of its conception, the variety and truthfulness of its characterization, and its fidelity to the essentials of that mid-Victorian life and society that will always possess significance. Written in a flexible, easy style that eludes notice by its very adequacy, the book lacks the purple patches of some of Thackeray's novels, but maintains throughout a high level of excellence. In plot it is an admirable example of simplicity in outline combined with intricacy in detail. It is a study of the development of Arthur Pendennis, an unheroic, very human hero, who goes to Oxford, is sent from the university in disgrace, returns and retrieves himself to the extent of winning his degree, fares forth into the world of men, makes a career for himself and after various love affairs marries the charming and forgiving Laura Bell. Thus outlined, the story is seen to depend less upon the striking nature of its incidents than upon the variety and vitality of its characters. These give the book its value. Around Arthur Pendennis are men and women as real as any that ever entered into the reader's own life: the immortal Major Pendennis; the gentle yet thoroughly feminine Helen Pendennis; the crude, sterling Foker; George Warrington, disillusioned but sound; the shiftless, fawning Costigan; Blanche Amory, the selfish sentimentalist. Moreover, these characters and their fellows are not mere types, but have the complexity, the mingled good and evil, of real human beings. They convey to the reader Thackeray's unrivaled knowledge of the men and women of his own day; and of the play of motives and intertwining of traits that persist from age to age. Less outspoken than its prototype, 'Tom Jones,' 'Pendennis' manifests greater range and subtlety, and will always remain one of the greatest of novels presenting the life and character and friends of a young man. Consult Trollope, Anthony, 'Life of Thackeray' (Chap. IV) and Ritchie, Mrs. Anne, 'Introduction to Biographical edition of Pendennis' (London 1898-99).

GEORGE B. DUTTON.

PENDENTIVE, in architecture, the name given to the masonry construction built in the angle of two vertical walls as a support for a domed ceiling. The pendentive may start from

a lintel placed across the angle or from a point in the line of intersection of the two walls, and may be plane, curved or carried up by corbeled courses. It is usually of the hollow spherical type, but often is conical—with the apex of the cone downward. It is a very common construction in the spandrels of large arches. In Gothic architecture the term is used to designate the portion of a groined ceiling springing from one pillar or impost and bounded by the ridges or apices of the longitudinal and transverse vaults.

PENDER, Harold, American electrical engineer: b. Tarboro, N. C., 13 Jan. 1879. In 1898 he was graduated at Johns Hopkins University; in 1901-02 was teacher at McDonogh School, Maryland; in 1902-03 instructor in Syracuse University; in 1903 at the Sorbonne, Paris; in 1904 electrical engineer with the Westinghouse Electric and Manufacturing Company; in 1904-05 with the New York Central Railroad. From 1905 to 1909 he was associated with Cary T. Hutchinson, electrical engineer, New York; in 1909-13 professor of electrical engineering at the Massachusetts Institute of Technology, where in 1913-14 he was director of research of the division of the department of electrical engineering. Since 1914 he has been in charge of the department of electrical engineering at the University of Pennsylvania. He has published 'Principles of Electrical Engineering' (1911); 'Electricity and Magnetism for Engineers' (1918); and numerous scientific and technical papers. He was editor of the 'American Electrical Engineering Handbook' for 1914.

PENDER, Sir John, Scottish pioneer in submarine telegraphy: b. Vale of Leven, Dumbartonshire, Scotland, 10 Sept. 1815; d. Kent, England, 7 July 1896. He was educated in the Glasgow high school, entered the counting-house of a Glasgow textile firm and in three years became its manager. He made the business his own under the firm name of J. Pender and Company, and it became one of the most important in the country, meantime accumulating for its owner an immense fortune. In 1856 he joined Cyrus W. Field (q.v.) in his projected enterprise of a submarine cable and was one of the original contributors to the fund raised to finance it. He held the office of chairman of the Anglo-American Company, and when, after years of failure and losses, the venture was about to be abandoned, he pledged his entire fortune as security for the new cable—which was successfully laid in 1866. Upon its completion he immediately organized companies to connect Great Britain with other parts of the world, and by 1882 66,000 miles of cable had been laid. He was knighted in 1888, sat in Parliament for Totnes in 1862-66, for the Wick Burghs in 1872-85, and 1892-96, at first as a Liberal, and in his last years as a Liberal Unionist. He was a member of many of the learned societies and held several foreign orders, among them the Legion of Honor and the Grand Cordon of the Medjidie. In 1869 he published 'Statistics of the Trade of the United Kingdom, from 1840.'

PENDER, William Dorsey, soldier: b. Edgecomb County, N. C., Feb. 6, 1834; d. Staunton, Va., July 18, 1863. In 1854 Pender

was graduated from West Point and entered upon military service in the far West. In 1861 he resigned and entered the Confederate service as captain, and in 1863 had reached the grade of major-general. He fought in the battles and campaigns of the Army of Northern Virginia and was wounded many times. His most distinguished service was at Seven Pines, first Cold Harbor, second Manassas, Sharpsburg and Chancellorsville. He was mortally wounded at Gettysburg.

PENDLETON, pěn'd'l-tŏn, **Edmund**, American statesman and jurist: b. Caroline County, Va., 9 Sept. 1721; d. Richmond, Va., 23 Oct. 1803. He was apprenticed in 1734 to the clerk of Caroline court, three years later became clerk of the vestry of Saint Mary's parish and was licensed in 1741 to practise law, in which profession he soon attained eminence. In 1751 he was made justice of the peace in his native county, an office which he held until 1777, when, by an accident, he was crippled for life. Meanwhile he was developing planting interests on a large scale, grants in his name numbering nearly 10,000 acres being on record. In 1752 he was elected to the House of Burgesses, and represented his county in that legislative body without interruption until it became extinct at the outbreak of the Revolution. Though he had been a member of the committee of the Virginia legislature, appointed, in 1764, to draw up memorials to the king, lords and Commons of England, protesting against the proposed Stamp Act, Pendleton, the following May, opposed Patrick Henry's famous resolutions, declaring "that the General Assembly of this colony have the only, sole and exclusive right and power to lay taxes." He opposed likewise as premature Henry's resolution of 1775, "that this colony be immediately put into a posture of defence." Pendleton may be regarded as the leader of the conservative party in Virginia, resisting change, but never reactionary after change had once been instituted.

In 1773 Pendleton was made a member of the Committee of Correspondence, which instantly gave a vigorous impulse to the colonial cause. In 1774 he was elected to the first Virginia convention, which met on 1 August, to respond to the call from New England touching the Boston Port Bill. This convention took steps for a general congress, to which Pendleton was sent as a delegate. Upon the dissolution of the royal government in Virginia, by reason of the flight of Lord Dunmore from the capital at Williamsburg, he was made president of the Committee on Public Safety, which piloted the colony during the trying times from 17 Aug. 1775 to 5 July 1776, when Patrick Henry took the oath as governor of the commonwealth. Acting in this capacity, Pendleton was virtually the ruler of Virginia in this transitional period.

Pendleton presided over the conventions which met in December 1775 and May 1776, the latter framing the Virginia constitution and directing the Virginia delegates in Congress to bring forward a motion declaring the independence of the united colonies. The resolution embodying these momentous instructions was drawn by Pendleton, and his words were incorporated almost as written into the Declaration

of Independence. In collaboration with Jefferson and George Wythe, Pendleton revised the laws of Virginia in accordance with the changed political situation. As president of the Court of Chancery, he presided from 1779 over the Court of Appeals, and thus for 15 years acted as head of the Virginia judiciary. In 1788 he was elected president of the Virginia convention which ratified the Constitution of the United States. Pendleton was a Nationalist even at that early time, and was a staunch supporter of peace. When war seemed imminent with France in 1798 he protested against fighting a sister republic. In his intuitive love of prescription, in his willingness to be pushed along the line of reform only by incontrovertible facts and in his efficiency in carrying out the details of a policy he had strenuously opposed in debate, he is strikingly like Sir Robert Peel. Jefferson said of Pendleton: "Taken all in all, he was the ablest man in debate I ever met."

S. C. MITCHELL,

President of Delaware College, Newark, Delaware.

PENDLETON, Ellen Fitz, American educator: b. Westerly, R. I., 7 Aug. 1864. In 1886 she was graduated at Wellesley College and subsequently studied at Newnham College, Cambridge, England. In 1886-88 she was tutor in mathematics and from 1888-97 instructor at Wellesley. From 1897-1901 Miss Pendleton was secretary of the college; in 1901-11 dean and associate professor of mathematics, and after 9 June 1911 president of Wellesley. In 1911 Miss Pendleton received the degree of Litt.D. from Brown University and in 1912 that of LL.D. from Mount Holyoke College.

PENDLETON, George Hunt, American legislator: b. Cincinnati, Ohio, 25 July 1825; d. Brussels, Belgium, 24 Nov. 1889. He was educated in Cincinnati and Heidelberg, Germany, studied law and was admitted to the bar. In 1854-55 he served in the State senate and was a member of the House of Representatives from his State from 1856-65. Throughout the Civil War he strongly opposed the administration, and in 1864 was candidate for the Vice-Presidency on the Democratic ticket with George B. McClellan. He ran for governor of Ohio in 1869, but was defeated. In 1878 he was elected United States senator from Ohio, and in 1882 he introduced the civil service reform bill known by his name and passed in 1883. In 1885 he was appointed by President Cleveland United States Minister to Germany.

PENDLETON, Louis (Beauregard), American novelist: b. Tebeauville (now Waycross), Ga., 21 April 1861. He was educated in Philadelphia and among his published novels and juveniles are 'Bewitched' (1888); 'In the Wire Grass' (1889); 'King Tom and the Runaways' (1890); 'The Wedding Garment' (1894); 'The Sons of Ham' (1895); 'In the Okefinokee' (1895); 'Corona of the Nantahales' (1895); 'Carita' (1898); 'In the Camp of the Creeks' (1903); 'A Forest Drama' (1904); 'In Assyrian Tents' (1904); and a 'Life of Alexander H. Stephens' (in the 'American Crisis Biography Series' 1908).

PENDLETON, William Kimbrough, American educator: b. Yanceyville, Louisa

County, Va., 8 Sept. 1817; d. Bethany, 1 Sept. 1899. He received his education at the University of Virginia, and, after graduating from the law school, was admitted to the bar. He joined Alexander Campbell in 1841 in founding Bethany College, the first educational institution of the "Disciples of Christ," also known as the "Campbellites," becoming professor of sacred history and philosophy, belles-lettres and political economy. From 1866 to 1887 he was president of the university. He served in the West Virginia Constitutional Convention. His activity in establishing a free-school system earned him the appointment as State superintendent of schools, in which position he served four years. In 1887, because of failing health, he removed to Florida. He died while on a visit to his old home at Bethany.

PENDLETON, William Nelson, American Episcopal clergyman and soldier: b. Richmond, Va., 26 Dec. 1809; d. Lexington, Va., 15 Jan. 1883. He was graduated from West Point in 1830, served there as assistant instructor in mathematics in 1831-32, resigned from the army in 1833, engaged in teaching mathematics in Bristol College, Pa., and in Delaware College. Resigning from the army he entered the Episcopal ministry, as a deacon, in 1837. The following year he was made a priest, and in 1839 he established the Episcopal high school in Alexandria, Va., and was its principal until 1853 when he was called to the charge of a church in Lexington, Va. In 1861 he entered the Confederate army as captain of artillery, was promoted to be chief of artillery in the Army of the Shenandoah and in 1862 received the rank of brigadier-general. He was engaged in all but three of the battles fought by the Army of Northern Virginia, beginning with Bull Run, was one of the commissioners appointed by General Lee to arrange terms of surrender in 1865, and then returned to his parish in Lexington, where he remained until his death. He received the honorary degrees of A.M. from Brown University, and D.D. from Kenyon College, and also from the Alexandria Theological Seminary. He published 'Science a Witness for the Bible' (1860).

PENDLETON, Ore., city, county-seat of Umatilla County, on the Umatilla River, and on the Oregon-Washington Railroad and Navigation Company's Railroad and the Northern Pacific Railroad, 206 miles east of Portland and 35 miles southwest of Walla Walla, Wash. The city was enlarged in 1884 by the addition of 640 acres of the Umatilla Indians' reservation. It is built on both sides of the river, which is here crossed by three bridges. The river affords good water power for manufacturing; the chief industrial establishments include flour mills, iron foundries, machine shops, woolen mills, planing mills, a harvester factory and a paper mill. There are also a grain elevator and a packing-house. The city has a high school and is the seat of Saint Joseph's Academy, a Roman Catholic school with elementary and secondary grades. The State Hospital for the Insane for Eastern Oregon is located here. The city has recently had an addition to its important buildings in the new Federal building (\$130,000), and the new Public Library (\$40,000). It has a wide celebrity through its annual exhibition festival, "The

Round-Up." The waterworks are under municipal ownership and control. Pop. (1920) 7,387.

PENDULUM, a mechanical construction of interest from two widely different points of view: the practical and the mathematical. It consists typically of a comparatively large and concentrated weight called the bob, and some sort of suspending material, usually of wood or metal, and called the rod. In considering the mechanics of the pendulum, it is customary to think of the suspension as a thread without weight, so that only the weight of the bob comes under discussion. In a state of equilibrium it is evident that the weight of the pendulum will hang motionless directly below the point of suspension. Upon moving the weight to one side of this central position and then releasing it, it swings down an arc of which the thread is the radius, toward the point of rest from which it was moved. The force which urges it down along the arc is not a simple force, but the resultant of two forces, one of which is gravity, acting vertically downward, and the other the pull of the thread, acting toward the point of suspension. As the weight swings down the arc, it gathers momentum—that is, weight multiplied by speed. When the bob has reached the lowest point of the arc, its accumulated momentum prevents it from stopping there, and it swings on upward over a similar arc until its momentum is expended—that is, until the force of gravity and the pull of the string combined overcome its impulse of motion. Obviously, if there were no exterior force applied the upward swing would be exactly equal to the downward swing, and once started the pendulum would swing on, to and fro, forever. But because of the friction of the air upon the bob the motion slows down until it finally ceases, and the bob again hangs at rest vertically below the point of suspension.

These simple motions of the pendulum are of great interest to the physicist, who sees in the instrument an engine for the transmutation of potential energy into kinetic energy. For as the bob swings down the arc it stores within itself potential energy to its lowest position in the arc. At this point, however, the potential energy becomes kinetic energy and drives the bob up the opposite arc, against the continuing pull of gravity.

The remarkable regularity with which the pendulum swings early commended it to clockmakers as a governor, to control and space off accurately and evenly the speed with which clock mechanisms ran down after winding. This was accomplished by an escapement wheel geared into the mechanism of the clock, and restrained by a release operated by the pendulum. In this way the pendulum was left free to swing, the delicate push of the escapement wheel being just sufficient to counteract the friction of the air on the bob. With this application to timekeeping, it became of interest to the clockmakers that the pendulum should be made of such a length as to beat exact seconds; and as the force operating the pendulum was gravity, the problem became somewhat complex, for the force of gravity was known to change with every variation of latitude, due to the flattening of the earth at the poles. The attraction of gravitation being less

at the equator than at the poles, the seconds-pendulum at the equator would be shorter than at the poles, where the attractive force was greater. The two extremes at which experiments were conducted were Hammerfest, Norway, in latitude $70^{\circ} 40' N.$, where the value of gravity was found to be 32.2364 feet per second; and Saint Thomas, an island off Portuguese West Africa, in latitude $0^{\circ} 25' N.$, where the value of gravity is 32.0957 feet per second. The length of the seconds-pendulum at Hammerfest is therefore 39.1948 inches, and at Saint Thomas, 39.0207 inches. At New York City, latitude $40^{\circ} 43' N.$, the seconds-pendulum is 39.1012 inches.

The seconds-pendulum was useful only in clocks of large size, like the so-called "grandfather's clock," and long wall clocks. The demand for small shelf clocks led to the arrangement of the clock train for a pendulum of 9.78 inches, beating half-seconds. For tower clocks the two-second pendulum of 13.04 feet is commonly used. Longer pendulums have been experimented with, but have proved troublesome to manage. The swing of the ordinary clock pendulum is through three degrees of arc, which length has given the most accurate results.

One of the peculiarities of the pendulum in its adaptation to the clock is that it is affected by changes in the pressure of the atmosphere. This is known as the barometric error. As the barometer falls, indicating a decrease of the pressure of the air, the pendulum spontaneously extends its arc of oscillation. This would make no difference in the time of its beat if the arc of the circle in which it swings were the isochronal arc of the pendulum—that is, the arc all parts of which are passed over by the swinging bob in equal sections of time. This, however, is not the case. The isochronal arc of the pendulum is the cycloid (q.v.), and while a very small arc of a circle does not depart from that of the middle of a cycloid to a practical degree, the longer the arc the greater the difference; and hence, the extension of the circular arc through lessening of the air pressure becomes a source of error in the precision of beat required for accurate timekeeping. In the delicate adjustment of the clock at Westminster, the two-seconds pendulum is made to swing over an arc of 5.5 degrees. With this length of arc the barometric error is exactly neutralized by the circular error arising from its extension. Another common source of error in the clock pendulum is that due to the extension of its length by a rise in temperature, and vice versa. This variation affects chiefly the length of the rod, but unless the bob is suspended from its centre of gravity, the expansion of the bob also may act to disarrange the timekeeping qualities of the clock. For ordinary clocks a pendulum constructed with a wooden rod rendered impervious to moisture by soaking in melted paraffin wax, with a hollow cylindrical bob of lead supported at its bottom edge, is self-compensating for the usual range of house temperatures. For clocks of precision, the gridiron or mercury compensating pendulums, described below, are employed.

In the mathematical discussion of the pendulum it is convenient to begin with the "simple pendulum," in which the bob is conceived

to be a mere material particle, and the suspending rod is assumed to be devoid of mass, and the motion is assumed to be confined to some one vertical plane passing through the point of support, and all retarding influences, such as the resistance of the air and the friction at the point of support, are neglected. The "period of oscillation" of any pendulum is defined as the time occupied by a single oscillation, counting from the instant when the pendulum is at its extreme position on one side of the vertical, to the instant when it next arrives at its extreme position on the other side of the vertical. It is easy to show that the period of oscillation of the simple pendulum, as defined above, is practically independent of the arc described by the bob, provided that arc is very small; this fact being expressed, in mathematical language, by stating that the vibrations of the simple pendulum are "isochronous," when the amplitude of the vibration is small. It may be readily shown, in fact, that the period of oscillation of a simple pendulum is given by the expression $3.1416 B \sqrt{L/G}$, where L is the length of the pendulum, G is the intensity of gravity (that is, G is the velocity that a freely-falling body would acquire in one second), and B is a function of the arc, A , through which the pendulum swings, in passing from one of its extreme positions to the other. The function B may be expressed in terms of A by means of a series in which A occurs only in

$$\text{ascending even powers: } B = 1 + \frac{A^2}{64} + \dots$$

When the arc, A , is very small, we may take B equal to unity in all cases, save those in which the highest possible refinement is required; and hence, in all ordinary computations, we may take the period of oscillation of the simple pendulum to be $3.1416 \sqrt{L/G}$, when the amplitude of the oscillation is small. If L is expressed in feet, and G in feet per second, the foregoing formula gives the period of oscillation in seconds. To find the length that a simple pendulum must have, in order that its period of oscillation may be precisely one second, we have only to set the foregoing formula equal to unity, and solve the resulting equation for L . Thus we have, for

$$\text{this case, } L = \frac{G}{(3.1416)^2}.$$

The value of G varying according to the latitude, we may use $G = 32.2$ as its average value, and this last formula shows that a simple pendulum, in order to have a period of oscillation of one second, must have a length of about 3.263 feet, or 39.150 inches.

A pendulum, when once set in vibration in a given vertical plane passing through its point of support, continues to vibrate in this same plane unless forced to depart from it by the application of some external force other than gravity. Foucault took advantage of this fact for experimentally demonstrating the rotation of the earth. In 1851 he constructed a pendulum which was approximately "simple," being composed of a heavy sphere of polished metal, suspended by a steel wire about 65 metres long. The experiment was performed under the dome of the Pantheon, at Paris. A pendulum of this sort, if set in vibration in a vertical plane at the earth's pole, would continue to vibrate in the same constant plane, while the earth rotated

under it at the rate of 360° every 24 hours, or 15° every hour. The rotation of the earth would therefore become evident to the eye; though, since the observer would be rotating with the earth, it would appear to him as though the earth were stationary, and the plane of the pendulum's motion were rotating. The phenomena would be somewhat more complicated in other latitudes, however, because it is only at the poles that the direction in which gravity acts remains constant while the earth rotates. Foucault showed that when allowance is made for the changing direction of gravity, the plane of vibration of a simple pendulum, in the latitude of Paris, should appear to rotate by $11^\circ 17' 33''$, per sidereal hour; and when the experiment was tried with the giant pendulum that he erected in the Pantheon, the actual apparent rotation was found to agree very closely with this theoretical value. Since 1851 this experiment has been tried many times; and a pendulum that is arranged, in accordance with Foucault's plan, for the purpose of demonstrating the rotation of the earth, is now known as a "Foucault pendulum."

Any pendulum whose mass is not wholly concentrated at a single point is said to be "compound." The simple pendulum is a convenient mathematical abstraction (such pendulums as Foucault's being merely close approximations to it); but we must, in strictness, regard all actual pendulums as compound. Fig. 1 represents a compound pendulum of generalized form, which is supposed to be vibrating in the plane of the paper (held vertically), about a horizontal axis passing through O, which is called the "axis of

FIG. 1.

suspension." If G is the centre of gravity of the pendulum the foot of the perpendicular that is let fall from G to the axis of suspension is called the "centre of suspension." In the same straight line with O and G there is a point C, called the "centre of oscillation" (or, sometimes, the "centre of percussion"), which has the following properties: (1) The time of

vibration would remain unaffected, if the entire mass of the pendulum were concentrated at C. (2) If the pendulum were inverted, and C were taken as the new centre of suspension, the period of oscillation would remain unchanged. (3) The period of oscillation of the actual, compound pendulum is the same as the period of oscillation of a simple pendulum having a length OC; and hence OC is commonly called the "length of the equivalent simple pendulum." To find the position of C, let H be the distance, OG, from the centre of suspension to the centre of gravity, and let K be the radius of inertia of the pendulum (that is, its moment of inertia divided by its total mass), with respect to an axis passing through G, and parallel to the axis of suspension. Then the distance, L, from O to C, is given by the expression $L = (H^2 + K^2)/H$. Evidently L is always greater than H.

In a piece of apparatus, such as an astronomical clock, in which it is important to have a pendulum execute its vibrations always in the same time, the temperature must be kept constant, or else some compensatory device must be employed, which will eliminate the effects due to its variation. Uniformity of temperature is important in all cases, because none of the compensation devices are perfect; and clocks of precision should be kept in rooms whose temperatures vary as little as possible. In such cases it is often sufficient to make the suspending rod of the pendulum of well-seasoned pine or fir since the coefficient of expansion of these woods is small, and if the temperature change is also small its effect upon the rate of the clock may become almost indistinguishable. Wooden pendulum rods are apt to be affected by changes in the hygrometric state of the air but this can be prevented by a good coat of varnish and the use of a suitable drying medium within the clock case. In Germany clock pendulums are commonly made of an alloy of nickel and steel which is known as "invar," and which has a coefficient of expansion that is almost negligible.

"Compensation pendulums" are those in which provision is made for the automatic elimination of the effects of changes of temperature. Of these the two commonest forms are the "gridiron" pendulum and the mercury compensation pendulum. In the gridiron form the bob is supported by means of a series of parallel bars, somewhat as represented, diagrammatically, in Fig. 2. In the diagram the central bar and the two outside ones are of steel, while the intermediate ones are of zinc, or, very commonly, brass. If the zinc bars should expand while the steel ones remained constant in length, the bob of the pendulum would evidently be raised; and if the steel ones should expand while the zinc ones remained constant in length the bob would be lowered. In the actual case, where a rise of temperature causes the zinc and the steel to expand simultaneously the effects of the two metals, in displacing the bob are therefore opposed. The effective length of the steel rods is about twice that of the zinc ones; but, on the other hand, the coefficient of expansion of zinc is about twice that of steel. On the whole, therefore, the position of the bob is not materially affected by a change of temperature.

In the mercury compensation pendulum the supporting rod is a simple bar of steel, but the bob consists of a cylindrical glass vessel containing mercury. A rise in temperature causes the suspending rod to dilate, and this tends to lengthen the pendulum. The mercury in the bob expands at the same time, however, and the centre of gravity of the mass of mercury there-

FIG. 2.

fore rises. The expansion of mercury is considerably greater than that of steel, and by properly proportioning the apparatus it is possible to make the rise of the centre of gravity of the bob, due to the expansion of the mercury, sensibly equal to the fall of the bob as a whole, due to the expansion of the supporting rod. The Riefler pendulum used in astronomical clocks has its tubular rod filled about two-thirds its length with mercury, thus acting as a compensator for both temperature and barometric changes.

The fact that G , the accelerating effect of gravity, enters into the expression for the period of oscillation of the pendulum, suggests the use of this instrument for the determination of the value of G ; and in fact it has been found that no other method of determining the intensity of gravity is comparable in accuracy with the pendulum method.

In determining the intensity of gravity by the pendulum, two general methods are followed, according as it is desired to make an "absolute" or a "relative" determination. The absolute determination is much more difficult to execute, because it necessitates the careful measurement of the length of the pendulum, and the determination of certain rather trouble-

some corrections. In principle it is simple enough, however, for if we knew the length of the pendulum (L), and its period of oscillation (T), we should merely have to substitute their values in the equation $T = 3.1416 \sqrt{L/G}$, and solve for G , which would be the only remaining unknown quantity. In relative determinations it is not necessary to measure the length of the pendulum (except roughly, for the purpose of making certain small corrections to the observations), the pendulum being merely vibrated in two different places, at one of which the intensity of gravity is known. If T_1 and T_2 are the times of oscillation in the two places, and if G_1 and G_2 are the corresponding intensities of gravity at these places, we have $T_1 = 3.1416 \sqrt{L/G_1}$, and $T_2 = 3.1416 \sqrt{L/G_2}$. Since L remains the same during such a determination, we find, by division, $T_1/T_2 = \sqrt{G_2/G_1}$; or $G_2 = G_1 T_1^2/T_2^2$. Hence, as G_1 is supposed to be known, and T_1 and T_2 have been measured, the value of G_2 is also known.

Pendulums that are to be used in determining the intensity of gravity are provided with steel knife edges, resting upon agate bearing plates as the suspension axis; the friction of the supports being reduced, by this device, almost to zero. Those which are to be used in relative determinations need not necessarily have more than one set of knife edges; but when an absolute determination is to be made, it is essential, in order to secure a high degree of accuracy, that two sets of knife edges should be provided, each being placed, as nearly as possible, at the centre of oscillation of the pendulum, relatively to the other one. If it were mechanically possible to realize this adjustment perfectly, the pendulum would vibrate with precisely the same period of oscillation, whether it were supported from one set of knife edges, or from the other one; and the distance from one of these sets to the other one would be precisely equal to the "length of the equivalent simple pendulum," which is denoted in the foregoing formulæ by L . In practice, however, it is not possible to place the knife edges so that the period of oscillation is not measurably altered by reversing the pendulum; and this fact makes it necessary to determine the period of oscillation twice,—once before reversal and once afterward. The distance between the knife edges must then receive a small correction, in order to deduce the "length of the equivalent simple pendulum"; but this branch of the subject is too technical for treatment in the present article. (Consult Clarke, 'Geodesy'; also the various 'Appendices' of the United States Coast and Geodetic Survey, bearing upon pendulum work). The use of the reversible pendulum, which is based upon Huyghens' theorem that the centres of suspension and oscillation are reciprocal, is due to Captain Henry Kater, of the British Army, who first employed it in 1818, for determining the length of the seconds-pendulum at London.

The "ballistic pendulum" is an apparatus for determining the velocity of a bullet. It is suspended in the usual way from a fixed horizontal axis, and the bob consists of wood or other suitable material, weighted, when necessary, by the addition of iron or lead. The pendulum being at rest in a vertical position, the bullet is fired into the bob, and the height to which the

pendulum bob rises in the initial swing is noted. The speed with which the bullet entered the bob may then be computed, if the masses of the bullet and the bob are known. The ballistic pendulum is not a very accurate instrument, partly because it takes no account of the thermal phenomena that occur when the bullet enters the bob, and partly for other reasons. It has now been almost entirely discarded, the velocities of projectiles being measured by more direct methods, that are capable of much greater precision.

The so-called conical pendulum, gyroscopic pendulum and torsion pendulum are not pendulums in the accepted sense of the term, and are not governed by the laws which control the pendulum, but by the laws of centrifugal motion. Consult United States Coast and Geodetic Survey, 'Special Publications' 10 and 12 (Washington 1912).

A. D. RISTEEN, Ph.D.

PENEDO, pā-nā'do, Brazil, city and port of the state of Alagoas, 70 miles southeast of Maceio, on the left bank of the São Francisco and about 26 miles from its mouth. It is located on a rocky bluff at the head of ocean navigation and is the transshipping point for the steamboat commerce of the upper river for 150 miles. It is the oldest settlement in the state, having been founded by the Portuguese about 1620; has ruins of a 17th century fort; contains several convents and schools; and now does considerable business in foodstuffs with Pernambuco and Bahia, with which it has regular steamer connections. There is fine fishing in the river. Pop. (estimated) 9,000.

PENELOPE, pe-nē'ō-pe, in Greek mythology, the daughter of Icarios and Peribœa, also known as Polycastê, of Sparta. When she reached womanhood her extraordinary beauty attracted many suitors, and her father promised to give her to the conqueror in a foot race. Odysseus (Ulysses) won the prize, but Icarios tried to persuade his daughter not to accompany Odysseus to Ithaca. The young victor allowed her to decide for herself, whereupon she covered her face with her veil to hide her blushes, thus intimating her desire to follow her husband. The fruit of the marriage was an only child, Telemachus, who was but an infant when his father was sent by the Greeks against Troy. During the protracted absence of Odysseus, which lasted 20 years, he was generally regarded as dead, and Penelope was surrounded by a host of suitors. Some writers assert that she became the mother of Pan by Hermes, or by all the suitors together; that her husband repudiated her on his return, and that she went to Sparta and thence to Mantinea, where her tomb was shown in after ages. The story generally accepted, however, describes in detail the artifices by which she put off deciding between the suitors, and one of these 'Penelope's Web' has become proverbial. She promised a decision when the web she was weaving should be finished. But at night she secretly unraveled what she had woven through the day. Finally being driven to a decision, she agreed to bestow her hand upon the winner in an archery contest. Her husband returned in time to take part in disguise in the contest and was the winner. See Odysses; ULYSSES.

PENEPLAIN, pē'nē-plān' (almost a plain), a plain cut by the erosive activity of running water. A region which has been cut as low as its rivers can plane it is said to be peneplained or base-leveled. Many once mountainous regions have been thus cut away to nearly level plains. The even sky-line of the New England uplands and the Appalachian Mountains, cutting across the upturned edges of hard and soft rocks, represents such a plain formerly reduced nearly to sea-level, but again uplifted and redissected by its streams. This very extensive peneplain was formed in Jurassic (q.v.) and Cretaceous (q.v.) time, and has been called the great Cretaceous Peneplain. It has also been called the Kittatinny or Schooley Peneplain, since it forms the even crest line of the mountains of those names. Any residual elevation not completely planed away and rising notably above the general level of a peneplain is called a monadnock, from the mountain of that name overlooking the New England Peneplain in New Hampshire. For an account of the process of peneplanation, see the section on the work of running water in the article on GEOLOGY.

PENETANGUSHENE, pēn-e'tān-gwīsh-ē'nē, Canada, town in Simcoe County, province of Ontario, on Georgian Bay and on the Grand Trunk Railway. It contains a Carnegie library, insane hospital, leather, lumber and engine works, foundries and machine shops, stove and range factories, boat and canoe works, sash and door factories, fibre board works, brick-yards, etc. It is acquiring a wide repute as a summer resort. Pop. 3,568.

PENFIELD, Edward, American artist: b. New York, 2 July 1866. He was educated at the Art Students' League, New York, and subsequently studied in England and Holland. From 1891 to 1907 Mr. Penfield was art editor of the Harper magazines. He now devotes his time exclusively to illustrating, designing and painting. Mr. Penfield was the originator of the poster in America, and used numerous "textures" in reproducing his drawings that were not attempted before in relief printing from zinc or other plates. He designed many posters for *Harper's Magazine*, and posters and designs for various purposes and illustrated a number of magazine articles in color. He executed decorations for the breakfast room of Randolph Hall, Cambridge, Mass., also decorations for the Rochester Country Club. He published 'Holland Sketches' (1907), and 'Spanish Sketches' (1911).

PENFIELD, Frederic Courtland, American diplomat: b. Connecticut, 23 April 1855; d. New York, 19 June 1922. He studied in Germany and England, then entered journalism and was for five years on the editorial staff of the *Hartford Courant*. In 1885 he was appointed United States vice-consul-general at London, and in 1893-97 served as diplomatic agent and consul-general to Egypt, with the rank of minister-resident. In 1913 he was sent as United States Ambassador to Austria-Hungary, where he remained until diplomatic relations between the two countries were severed in 1917. He acted as special representative of President Wilson at the funeral of Emperor Francis Joseph in Austria. He traveled extensively in India, China and Japan and was honored by various foreign

societies. He received decorations of the highest class from governments of France, Turkey, Serbia and Egypt and from the Pope. He published 'Present Day Egypt' (1899); 'Mahmoud Pasha' (1903); 'East of Suez' (1907); and numberless articles on international and economic subjects in the leading reviews and periodicals.

PENFIELD, Samuel Lewis, American mineralogist: b. Catskill, N. Y., 16 Jan. 1856; d. South Woodstock, Conn., 12 Aug. 1906. He studied abroad, at Strassburg and Heidelberg. He was graduated from the Sheffield School at Yale in 1877, and became professor of mineralogy there. He was a member of the National Academy of Science, and was from 1877 an extensive contributor on the subjects of mineralogy, crystallography and chemistry in the *American Journal of Science and Art*. He was a leading authority on mineralogy. He published 'Brush-Penfield Determinative Mineralogy and Blow-Pipe Analysis' (1898), and was joint author with L. V. Pirsson of 'Contributions to Mineralogy and Petrography from the Sheffield Scientific School' (1901).

PENFIELD, William Lawrence, American lawyer: b. Dover, Lenawee County, Mich., 2 April 1846; d. 9 May 1909. He was graduated from the University of Michigan in 1870, whence he went to Adrian College as instructor in German and Latin. In 1872 he was admitted to the Michigan bar. He then took up the practice of law in Auburn, Ind., and in 1876 became city attorney. In 1884 he was a member of the Republican State committee; in 1888 presidential elector and electoral messenger and delegate to the National convention in 1892. He was judge of the Fifth Circuit Court of Indiana 1894-97 and in the last-named year was appointed Solicitor of the United States Department of State, where he served till 1905. He was counsel for the United States in international arbitration cases of the United States against San Domingo, Peru, Haiti, Nicaragua, Guatemala and Salvador, securing awards for the United States which amounted to over \$2,000,000. He was also appointed to represent the United States before The Hague permanent arbitration court in the controversy with Mexico over the "Pious Fund Claim of the Californias," this being the first case to be tried before this tribunal. He was counsel for the United States and for Venezuela in the Venezuela arbitration case at The Hague in 1903. In 1905 he was sent as a special commissioner to Brazil. In 1907 he acted as diplomatic agent and counsel for the United States in the arbitration proceedings with Nicaragua.

PENGUIN, a name now restricted to the swimming birds forming the very distinct super-order *Impennes*, and the family *Spheniscidae*. Their wings are inflexible paddles, destitute of quill-feathers and covered with a scaly integument or skin. Although useless as organs of flight, they are very effective aids in diving, and on land may be used after the fashion of forelimbs. Most of the swimming is done below the surface, the bird coming up at frequent intervals to breathe. The hinder toe is rudimentary, or wanting in some species, and the front toes are completely webbed. On the body the feathers are scale-like and barbless, and are

distributed uniformly, without naked intervals. These birds exist in immense numbers in the Antarctic seas. They occur on the South African and South American coasts, being found in large flocks at Tierra del Fuego and on the Pacific islands, Australia and New Zealand. They are gregarious in habits. On shore penguins have the habit of standing in long, regular lines, resembling files of soldiers drawn up in military array. Owing to the very posterior position of the legs the attitude on land is erect, often with the bill pointing to the zenith. They stand from 16 to 48 inches tall and weigh up to 75 pounds. The female incubates the eggs, holding them between the thighs, and they are said to carry off the eggs in the same fashion when disturbed or alarmed. The eggs are white or greenish in color and have a very thick incrustated shell. They are conical in shape, about four inches long and three inches in diameter. The male supplies the female with food during incubation, both parents feeding the young after they are hatched. The young birds are extremely helpless and many are killed by severe and sudden storms. The nests are formed in the hollows of rocks, and the eggs are deposited on the thick layer of excrement, which, accumulating through long periods of time, constitutes the valued guano of commerce. The eggs, though of rather strong flavor, are highly esteemed by sailors as adding variety to their diet. The birds themselves are also eaten. The usual food consists of fishes, mollusks, etc. As a family the penguins represent, in the southern seas, the auks of the northern and Arctic regions. There are three principal genera: *Aptenodytes* with *A. patagonica*, the king penguin, and *A. fosteri*, the emperor penguin; *Eudyptes* with *Eudyptula minor*, the little blue penguin, and *Catarractes chrysocome*, the crested penguin; and *Spheniscus*, with *S. demersus*, the well-known Cape or jackass penguin. The penguins are regarded by naturalists as constituting one of the three great classes of birds, the ostriches forming another class and all other birds a third class. There are six genera, with 20 living species, and 30 fossil species have been recognized. Prominent among the latter is *Palæudyptes antarcticus*, found in New Zealand. Some specimens were seven feet tall. Consult Moseley, 'A Naturalist on the Challenger'; Buller, 'Birds of New Zealand'; and the writings of Antarctic explorers.

PENHALLOW, pën-höl'ō, Samuel, American colonist and historian: b. Saint Mabyn, Cornwall, England, 2 July 1665; d. Portsmouth, N. H., 2 Dec. 1726. He came to New England in 1686 and finally settled in Portsmouth where he amassed a considerable property and gained much influence in government affairs. After holding several offices he was appointed a justice of the Superior Court of Judicature in 1714, and in 1717 became chief justice, which office he held until his death. His work as a historian is of much value, has been several times republished, and is considered the most authentic history of the period in existence. It was first published under the title 'Narrative of the Indian Wars of New England from 1703-1726' (1725-26). It now bears the title 'A History of the Wars of New England with the Eastern Indians.'

PENICK, Charles Clifton, American Protestant Episcopal bishop: b. Charlotte County, Va., 9 Dec. 1843; d. near Baltimore, Md., 13 April 1914. He was educated at Hampden-Sidney College, studied theology at Fairfax Seminary, Alexandria, Va. He was ordained in the Episcopal Church in 1870 and in 1877 was consecrated missionary bishop of Cape Palma, West Africa. He resigned in 1883 and has since had charge of various parishes. Bishop Penick served four years in the war between the States as sergeant of the 38th Virginia Regiment, Armstead's Brigade, Pickett's Division. He was at nearly every battle of importance fought in northern Virginia, and also at the battle of Gettysburg, and surrendered with General Lee's army at Appomattox, 9 April 1865. After his return from Africa he was very active and had several charges: Richmond, Va., Louisville, Ky., Fairmont, W. Va., his last charge being Frankfort, Ky. He was greatly interested in the welfare and upbuilding of the colored people of the South, and gave one year of his life traveling over the States and making reports to the church as to the best means of helping them. Through his influence and principally with his own money he educated and put in the ministry 11 or 12 young men.

PENINSULA CAMPAIGN OF 1862, The. A campaign against Richmond having been decided upon as the stroke which would most speedily put an end to the Southern Confederacy, a sharp difference of opinion arose between President Lincoln and General McClellan, commanding the Army of the United States, as to the most advisable route by which to make the approach to the capital. The President, sustained by some of his veteran military advisers, preferred a direct march to Manassas Junction, and thence southward, at all times keeping the army in a position covering Washington. McClellan insisted upon transporting the Army of the Potomac, 110,000 to 140,000 men, to the vicinity of Fortress Monroe and thence up the York Peninsula. The President, 8 March 1862, reluctantly yielded to the plan of campaign urged by McClellan, making the condition that a sufficient force should be left at and near Washington to insure its safety, that not more than 50,000 men should be moved to the new base until the navigation of the Potomac from Washington to Chesapeake Bay should be free from the Confederate batteries, and that the movement should begin as early as 18 March. The day after the issue of this order the Confederates evacuated their positions at Centreville and Manassas, in front of Washington, and abandoned their batteries on the Potomac. This movement changed completely the conditions under which the President had limited the number of men McClellan might take, but no change was made in that restriction. As McClellan proposed to take the field with the Army of the Potomac, he was relieved from command of all other military departments, thus isolating his expedition and leaving the command of other troops in the vicinity to Washington; a division of command which invited disaster, and, indeed, led, with other miscalculations, to the failure of the campaign. The Army of the Potomac, under the President's order, was organized into five corps: the First, General McDowell; Sec-

ond, General Sumner; Third, General Heintzelman; Fourth, General Keyes; Fifth, General Banks. McClellan had nothing to say as to the appointment of these commanders. They were given their commands by the President. Banks was charged with the care of the Shenandoah Valley, the Upper Potomac, and the positions of Manassas Junction and Centreville, and General Wadsworth had command of the troops garrisoning Washington. The campaign began 17 March by the embarkation of two divisions of the Third corps, which were landed at Fortress Monroe and placed in position on the roads leading to Newport News and Yorktown. Other divisions followed, and McClellan in person reached Fortress Monroe on the afternoon of 2 April. The force actually transported was Sumner's, Heintzelman's and Keyes' commands, with a few thousand of regulars—infantry and cavalry—and 2,700 reserve artillery; in all, a total of 109,419 men, 14,502 horses and mules and 44 batteries with 343 guns. The fleet occupied in this transport was upward of 400 vessels.

On the 4th the movement began, Heintzelman's corps on Yorktown, Keyes' on its left. On the morning of the 6th Heintzelman was stopped by the Confederate works at Yorktown, and on the left Keyes was checked by a small battery on the line of Warwick River. The Confederates, under Gen. J. B. Magruder, held a line across the Peninsula from the mouths of the Warwick River and Deep Creek, on James River, to Yorktown, on York River. The line, about 12 miles in length, was covered a great part of the distance by boggy and difficult swamps, and quite well fortified by redoubts at the road crossings and a series of dams which had been raised to flood the swamps. The entire opposing force was (4 April) 11,000 men, of which about 6,000 were at Yorktown and Gloucester Point on the opposite bank of the York River, leaving but 5,000 to cover the remaining 11 miles. A part of McClellan's plan was that the navy should reduce Yorktown from the river, but no orders were issued to the navy to co-operate. The existence of this Warwick River line was a surprise to McClellan, who knew that Yorktown was fortified, but had no knowledge of the defensive works extending from that place to the James, and his movement on Yorktown was predicated on the belief that he could turn it by his left. Keyes' force of 25,000 men was, therefore, halted in the face of the unknown opposition while a movement was made against Yorktown. It was a part of McClellan's plan, also, that McDowell's corps should turn Yorktown by the right, by landing at Gloucester Point on the north bank of York River, but on the 5th he was notified by the adjutant-general of the army that McDowell had been withheld from his control to defend Washington, as it was claimed that McClellan had not complied with the President's condition to make Washington secure, and McDowell was necessary to that security. McClellan protested and urged that at least McCall's and Franklin's divisions of McDowell's corps should be sent him, and a few days later the President ordered Franklin's division to report to him, which it did on the 20th. Meanwhile McClellan had begun a regular siege of Yorktown, and apparently gave up all idea of breaking the Warwick line at any

point, though strongly urged by the President to do so. He reconnoitered the line and, 16 April, had an engagement at Lee's Mill (q.v.), which only the more strongly confirmed him in the prosecution of a regular scientific siege. A month was spent in preparation. Batteries were constructed and 90 heavy guns put in position. (See YORKTOWN, SIEGE OF). But McClellan's plans had leaked into the possession of the enemy, and just as he was about to open fire on the morning of 4 May, it was discovered that during the day and night preceding the Confederates had abandoned the place very deliberately and marched for Williamsburg and Richmond, leaving a booty of 71 guns of various calibres to pay McClellan for a month's arduous toil of a whole army. McClellan started in pursuit, but not until noon did his troops get on the road, McClellan remaining at Yorktown to superintend the loading of Franklin's division on transports for the purpose of ascending York River, to land opposite West Point, and attack the Confederates in flank. The Confederate rear-guard was overtaken by the Union advance at Williamsburg, and a severe engagement ensued on the 5th, in which the Confederates' loss was 3,000 killed and wounded and 600 prisoners. The Federal loss was 2,073 killed and wounded and 623 taken prisoners.

Franklin did not get off from Yorktown until the 6th, reaching Eltham Landing about West Point, at 1 P.M., where he disembarked his troops and awaited orders. The greater part of the Confederate army was already beyond striking distance, but to protect its trains, a division attacked Franklin on the morning of the 7th and engaged him until 3 P.M., when it withdrew. Stoneman's cavalry opened communication with Franklin at Eltham's Landing, and the Army of the Potomac marched from Williamsburg on the 8th, passing through Barhamsville, Roper's Church and New Kent Court House, headquarters being established at Cumberland, on the south bank of the Pamunkey, on the 15th, and on the 16th at White House, where a permanent depot was organized. Gen. Joseph E. Johnston, commanding the Confederate army, since 17 April, had halted but 22 miles from Williamsburg until 15 May, when, hearing that the *Merrimac* had been destroyed and James River opened to the Union gunboats as far as Drewry's Bluff, he crossed the Chickahominy, and on the 17th encamped his army about three miles from Richmond. At McClellan's request the President ordered an expedition up James River, which was halted at Fort Darling by the Confederate iron-clad *Virginia*, formerly the *Merrimac*, and the shore batteries, and Commodore Rodgers suggested to McClellan a land expedition to co-operate with the navy in the capture of that work, but McClellan preferred to delay the matter until after he should have crossed the Chickahominy. Meanwhile, by taking from Sumner, Heintzelman and Keyes each a division, McClellan had organized two additional corps and given command of them to Generals Fitz-John Porter and Franklin. On the 21st his army was drawn up along the north bank of the Chickahominy, facing Richmond, which was but 7 to 12 miles distant. Soon after the battle of Williamsburg (q.v.) McClellan's call for reinforcements became earnest and per-

sistent; he reported that he had not more than 80,000 fighting men, and that the enemy had many more. The President finally consented to send McDowell overland from Fredericksburg, with 40,000 men and 100 guns, to co-operate with McClellan by coming in on his right, but in no case to uncover Washington. McDowell was to have marched on 26 May, and to clear his way McClellan ordered Gen. Fitz-John Porter, with about 12,000 men, to drive from the vicinity of Hanover Court House, 14 miles north of Richmond, a considerable body of the enemy, under Generals Anderson and Branch, and to destroy the bridges over the South Anna and Pamunkey rivers and cut the railroad connecting Richmond directly with northern Virginia. Porter started from New Bridge on the Chickahominy on the morning of the 27th, with a division of infantry and some regular cavalry and artillery. At the same time Col. G. K. Warren, with a brigade moved from Old Church on a road running parallel to the Pamunkey. Porter engaged and defeated Branch at Hanover Court House (q.v.), destroyed some of the bridges on the railroad and returned to his old camps. But McDowell did not join McClellan. When his head of column had marched but a short distance out of Fredericksburg his entire movement southward was suspended by orders from Washington, and he was sent westward against "Stonewall" Jackson in the Shenandoah Valley (q.v.). Meanwhile the corps of Keyes and Heintzelman had crossed the Chickahominy, Keyes' advance taking position at Seven Pines, on the main road leading to Richmond, about five miles from the city. Heintzelman was in rear, and the three corps of Sumner, Franklin and Porter were on the north bank of the Chickahominy, forming almost a semi-circle concave to the Confederates. On 31 May McClellan reported a strength of 126,089 officers and men present, with 280 field guns. At the same time the Confederate army defending Richmond numbered about 58,000 men. Johnston, with about 32,000 of these, attacked the 19,000 of the two Union corps south of the Chickahominy on the 31st, driving them back some distance, when he was checked by Sumner, who had hurriedly crossed the Chickahominy and struck his left. During the closing hours of the engagement Johnston was severely wounded, and Gen. G. W. Smith succeeded to his command. On the morning of 1 June the battle was renewed, and it ended with the success of the Union troops, who gained the ground lost the previous day. This battle is known as that of Fair Oaks or Seven Pines (q.v.). The Confederate loss was 4,500 and the Union loss 5,700. During this action McClellan had 50,000 men inactive at Cold Harbor, but feared to move them lest his right flank be turned by a force whose strength he did not know. At noon of 1 June Gen. R. E. Lee assumed command of the Confederate army, and at night he ordered its withdrawal to the camps near Richmond, which was done by daybreak next day.

The country was now drenched with torrential rains and great freshets followed carrying away all the bridges, which the Union army was compelled to rebuild. For nearly a month both armies remained inactive, each strengthening its position, General Lee bringing up troops

from every possible quarter until late in June, when, including Jackson's command, he had 80,762 men. McClellan had received McCall's division of McDowell's corps as a reinforcement, and had 92,500 men. On 25 June Porter was on the right of the line, north of the Chickahominy, the four corps of Franklin, Sumner, Heintzelman and Keyes south of it, and on that day, preparatory to a general movement on Richmond, an advance was made in front of Seven Pines, which brought on the battle of Oak Grove (q.v.), with no material result; but it marked the beginning of the "Seven-days' Battles" (q.v.). "Stonewall" Jackson had now been brought from the Shenandoah Valley, and 26 June Lee crossed the Chickahominy with the greater part of his army to turn McClellan's right, cut him off from his base at White House and force him to retreat down the peninsula. Lee attacked McCall's division at Mechanicsville or Beaver Dam Creek (see MECHANICSVILLE, BATTLE OF), and was signally defeated. On the 27th McCall fell back, and Lee, advancing and joined by Jackson, fell upon Porter's corps at Gaines Mill (q.v.), inflicting upon it and Slocum's division of Franklin's corps a bloody defeat. The Federals lost 7,000 killed and wounded and the Confederates many more, but the latter had been victorious. That night McClellan came to a determination, which he had had under consideration, to retreat to James River; his trains were put on the road to cross White Oak Swamp, and move to Haxall's Landing, and Porter's corps recrossed to the south side of the Chickahominy and followed. The bridges across the Chickahominy were destroyed. Fortunately for McClellan General Lee did not correctly understand his movement on the 28th, and he withdrew his right, under cover of his left, which remained in the works fronting Richmond, preventing General Magruder from getting any knowledge of what was going on. Late in the afternoon and night of the 28th Lee came to the conclusion that McClellan was retreating to James River, but gave no order for pursuit until the morning of the 29th, when Longstreet, A. P. Hill, D. H. Hill and Jackson were ordered to recross to the south side of the Chickahominy, and General Magruder, who discovered by sunrise that the works in his front had been abandoned by Sumner and Heintzelman, was ordered to pursue by the Williamsburg road, and General Huger by the Charles City road. At 9 A.M. Magruder overtook Sumner at Peach Orchard or Allen's Farm (q.v.), and a battle resulted, in which Magruder was checked, and after which Sumner fell back to Savage Station (q.v.), where he was again attacked by Magruder late in the afternoon. He held ground until dark, when he fell back across White Oak Swamp, and with Franklin and Heintzelman prepared to dispute the Confederate advance. Lee now concentrated for a heavy blow to cut McClellan's army in two and destroy it. He threw his divisions upon Sumner, Franklin and Heintzelman on the 30th, at Glendale (q.v.), but was unsuccessful. Next morning (1 July) the Army of the Potomac was in position at Malvern Hill, on the James. Lee followed, and in the afternoon attacked and was repulsed with great loss. McClellan was urged to retreat no farther, but

he abandoned Malvern Hill during the night and by morning of 2 July his head of column was at Harrison's Landing. The Confederates did not come up to his position until the morning of the 4th. Lee thought it not judicious to make an attack, and on the 8th marched the main body of his army back to the vicinity of Richmond, and the Peninsula Campaign was ended. The Union loss in the campaign was 16,600 killed and wounded and 7,500 captured or missing. The Confederate loss was 27,000 killed and wounded and 2,000 captured or missing. In both armies the sick-list was very large and many died. Consult 'Official Records' (Vol. XI); 'McClellan's Own Story' (New York 1887); Michie, P. S., 'Life of McClellan' (New York 1901); Webb, 'The Peninsula'; Swinton, 'The Army of the Potomac'; Barnard, J. E., 'The Peninsula Campaign' (New York 1864); Comte de Paris, 'History of the Civil War,' Vol. II; Walker, 'History of the Second Army Corps'; Powell, 'History of the Fifth Army Corps'; Fitzhugh Lee, 'Life of Gen. Lee'; Allan, 'History of the Army of Northern Virginia'; 'The Century Company's 'Battles and Leaders of the Civil War' (Vol. II).

E. A. CARMAN.

PENINSULAR STATE, a name applied to Florida on account of its geographical outline.

PENINSULAR WAR, *The*, sometimes called the War of Spanish (or Portuguese) Independence, a series of important campaigns 1808-13, against Napoleon in the Iberian peninsula, his opponents being the English, Spanish and Portuguese. Canning was a firm believer in the utilization of aroused national feeling against Napoleon in states invaded by the French. Such a feeling had sprung up in Spain in 1808, when Ferdinand, Prince of Asturias, having received the crown of Spain by the abdication of Charles IV, his father, ceded it to Napoleon, who gave it to Joseph Bonaparte 6 June 1808. In spite of brave opposition, the French king entered Madrid 14 July; but six days later three French divisions were forced to surrender, guerrilla warfare increased in force, and Spain showed the first successful national resistance to Napoleon. But before this, by the aid of Charles IV, when he was still king of Spain, a French army under Junot had entered Portugal, and a Portuguese rising followed that in Spain. The provisional government of the insurgents asked help from England, so that, at the close of the year 1808, the future Duke of Wellington had defeated the French at Rorica and at Vimeiro 21 August. Junot by the Convention of Cintra, 30 August, had promised to evacuate Portugal; and, in fine, Canning's policy had proved successful enough to justify itself thoroughly. The campaign in Spain in 1809 was opened by Napoleon himself at Madrid, and all looked gloomy for Spain until July, when Wellington, having dislodged from Portugal a fresh French army under Soult, invaded Spain and won the victory of Talavera de la Reina, 28 July, which effected little because of inadequate support in the field and at home so that the latter part of the year, like the former, was a monotonous series of French successes over untrained Spanish troops. The third year of the war (1810) was taken up by the attempts

of the French armies to complete their conquest of Spain and to drive Wellington from his fortifications at Torres Vedras; but Masséna was forced early in 1811 to retire from Portugal to Spain. He was pursued and defeated by Wellington at Fuentes de Onoro 5 May 1811. On 16 May Portugal was again emptied of French troops by Beresford's victory over Soult at Albuera. In central Spain the French suffered from guerrilla attacks and only in the east, where Suchet controlled Valencia and Aragon, were they successful. In 1812, the year that saw the grand army wrecked in Russia, Wellington completely defeated Marmont at Salamanca 22 July, and Joseph Bonaparte left Madrid, which was occupied by the English 12 August. However, the French held Burgos, and Suchet was still invincible. But the French armies in Spain were weakened by the demands of the German campaign of 1813. Wellington broke communications with Paris, at Vitoria, 21 June, defeated Jourdan—a victory which left Suchet entirely unprotected and forced him to retire—and 31 August stormed San Sebastian, thus breaking the last vestige of French power in Spain and making his way into France itself. There he was equally successful at Saint Palais 15 February, and at Vic-en-Bigorre 19 February, and was still manoeuvring against Suchet when word came of Napoleon's abdication. Consult Napier, W. F. P., 'History of the War in the Peninsula' (London 1828-40); Arceche y Moro, 'Guerra de la independencia' (1868-1901); Shand, A. I., 'The War in the Peninsula' (New York 1898); and Oman, C. W. C., 'History of the Peninsular War' (Oxford 1902).

PENITENTIAL PSALMS, seven psalms in which repentance is expressed and pardon asked of God. In the Authorized Version they are: 6, 32 (Latin numeration 31), 38 (L. N. 37), 51 (L. N. 50), 102 (L. N. 101), 130 (L. N. 129), and 143 (L. N. 142). In the Roman Catholic Church they are used on solemn occasions, and Pope Innocent III (1198-1216) ordered their recitation in Lent. Pius V (1566-72) appointed the Fridays in Lent as proper days for this exercise. We are told that Saint Augustine when he was dying caused these Psalms to be written out on the wall facing his bed, and their classification and name are of great antiquity. In the Anglican Church they are appointed to be used in the services for Ash Wednesday, the Prayer Book direction to that effect having been inserted in the revision of 1662. The most deeply penitential and the most frequently in use is the 51st Psalm, known also as the Miserere.

PENITENTIARY, a word employed in the early Church to designate the priest or presbyter whose office was to receive the private confessions of the people, and to advise as to whether public or private penance was demanded by the heinousness of the offense. The penitentiary had no power to impose penances. The office was abolished in the East by Nectarius, patriarch of Constantinople, during the reign of Theodosius. It still exists in the Roman Catholic Church where penitentiaries are of varied rank. The cardinal grand penitentiary presides over tribunal of penitentiaries at Rome, as a sort of chief justice of the ecclesiastical supreme court. Peni-

tentiary priests are special ecclesiastical officers appointed by the Pope to hear confessions in the three patriarchal churches, of the Vatican, the Lateran and Santa Maria Maggiore. The Council of Trent decreed that every bishop should establish in his cathedral church a penitentiary priest who must be either a doctor, master or licentiate in theology or canon law and not under 40 years of age. His office is to consider and determine especially cases of absolution or dispensation referred to him.

PENITENTIARY, a prison. See **PEN-
OLOGY**.

PENJAMO, pān'hā-mō, Mexico, town in the state of Guanajuato, 35 miles northeast of the Valle de Santiago, in a fertile and well-watered valley on the right of the Rio de Leon and within four miles of the Queretaro-Guadalajara railroads. The birthplace of the Mexican patriot Miguel Hidalgo y Costilla is in the nearby village of Dolores Hidalgo. Pop. about 9,000.

PENJDEH, pēnj'dā, Turkestan, the name of an oasis in lat. 36° 4' north, long. 62° 41' east, the seat of a Turcoman camp, 130 miles north of Herat. It is of irregular form, about 27 miles in extreme length and 20 miles in extreme breadth and has an area of about 300 square miles. It belonged to Afghanistan until 1885. Its importance is derived from its location in the long-disputed boundary region between the English and Russian spheres of influence. Its seizure by the Russians on 30 March 1885 led to elaborate preparations for war; but after various conferences a treaty was arranged in 1887 by which the Russians were allowed to remain in possession. On the breaking up of the Russian Empire in 1917 Penjdeh was lost to Russia. The people keep large flocks, and are expert in the manufacture of cloth and carpets. Pop. about 117,000.

PENN, John, American colonial governor of Pennsylvania, grandson of William Penn (q.v.): b. London, England, 14 July 1729; d. Philadelphia, Pa., 10 Feb. 1795. He was educated in the University at Geneva, came to Philadelphia in 1753, and served in the provincial council as its First Member until after Braddock's defeat, when he left the colony, going back to England, where he remained eight years. He returned as lieutenant-governor in 1763, and his administration was much disturbed by troubles with the Indians, with whom he finally succeeded in forming the treaty of Fort Stanwix in 1768. He was absent in England in 1771-73, but returned with full power as governor, and during the early portion of the Revolutionary period endeavored to steer a middle course, but in 1775 his council was supplanted by the committee of safety. His loyalty being questioned, he was imprisoned for a time in 1777-78, but was released after a few months; however, with the other members of the Penn family, he was stripped of all his proprietary rights, receiving a share of the £130,000 allowed by the legislature for lands transferred to the possession of the State. He also received one-fourth of the annuity of £4,000 which the British government granted to the family. Consult 'Pennsylvania Archives'; Sheperd, 'Proprietary Government in Pennsylvania.'

PENN, John, American statesman: b. Caroline County, Va., 17 May 1741; d. North Carolina, September 1788. He studied law, was admitted to the bar in 1762 and became a successful practitioner, attaining a reputation for eloquence and ability. In 1774 he removed to Greenville County, N. C., and in 1775 was elected to the Continental Congress, where he signed the Declaration of Independence in 1776. He was re-elected for the term 1778-80, and upon the invasion of Lord Cornwallis Penn was placed in charge of the affairs of the State with power nearly that of a dictator; he performed the difficult duties of his trust with much credit, and in 1784 was made receiver of taxes for North Carolina. This office he resigned after a month, and retired to private life.

PENN, Richard, English colonial governor of Pennsylvania, grandson of William Penn: b. England, 1735; d. Richmond, Surrey, England, 27 May 1811. He was educated at Saint John's College, Cambridge, accompanied his brother, John Penn (q.v.), on his return to Pennsylvania in 1763, and in 1764 became a member of the Provincial Congress. He went back to England in 1769, but came again to America to act as deputy-governor in 1771-73, during his brother's absence in England. At the outbreak of the Revolution he sympathized openly with the colonists, among whom he was very popular, and in 1775 acted as the messenger of Congress to England with a petition for various concessions. He did not return to America for many years and then only for a brief visit in 1808. From 1784-1808 he sat in Parliament, after which he retired to private life. His wife, Mary, whom he married in 1775, was a daughter of William Masters of Philadelphia.

PENN, Thomas, English colonial proprietor in America, son of William Penn: b. London, England, 8 March 1702; d. at Stoke Poges, 21 March 1775. He was invested with power of attorney by his brothers John and Richard, and came to Pennsylvania in 1732 to look after the interests of their immense estate. He was a member of the provincial council and remained in the colony until 1741. When the disputes concerning boundaries and taxation were settled Thomas and his brother Richard (John having bequeathed his interest to the former on his death in 1746), were in possession of a feudal estate of 25,000,000 acres with over 200,000 inhabitants, which was exempt from taxation. This condition led eventually to the commissioning of Benjamin Franklin in 1757 to present to Thomas Penn, then in England, a protest known historically as the "Heads of Complaint." In 1760 the long litigation between Thomas and his brother Richard on one side and Lord Baltimore on the other was definitely settled. (See **PENN v. BALTIMORE**). Upon the seizure of the great estates of the Penn family by the State in 1775 Thomas Penn received three-fourths of the State's award of £130,000 for the lands taken. He is reputed to have been one of the founders and a chief supporter of the College of Philadelphia, which afterward became a part of the University of Pennsylvania.

PENN, Sir William, English admiral: b. Bristol, England, 1621; d. Wanstead, Essex, England, 16 Sept. 1670. He early entered the navy and served with rapid promotion. In

1648 he was made rear-admiral and in 1649 captain and vice-admiral of the Irish fleet. In 1652 he was appointed to the same office in the fleet under Admiral Robert Blake. To him was due, in a great measure, the victory of Portsmouth in February 1653. On 2 Dec. 1652 he was appointed general of the fleet. At the termination of the war with Holland, Penn determined to desert Cromwell, and accordingly offered his allegiance and his fleet to the Stuarts. Charles could not then dispose of the fleet and advised him to continue in the service of the Commonwealth until an opportunity favorable to their plans should arise. In 1654 he was appointed general and commander-in-chief of the expedition which in 1655 wrested Jamaica from the Spaniards, and on his return was imprisoned in the Tower, ostensibly on the charge of having absented himself from his duty without leave, but really because his relations with Charles had been discovered. Upon his release a few weeks later he retired to his estate in Munster and there remained until the eve of the Restoration. In 1660 he was knighted and made a commissioner in the navy; his possession of certain Irish estates was confirmed by the king in 1665 and in that year as Great-Captain-Commander under the Duke of York he won the victory over the Dutch off Lowestoft. He held no further command afloat, but was connected with the naval office until his death.

PENN, William, founder of Pennsylvania: b. London, 14 Oct. 1644; d. Ruscombe, Berkshire, 30 July 1718. His father was Vice-Admiral Sir William Penn, who had a remarkably successful career in the British navy. His mother was Margaret Jasper, the daughter of a wealthy merchant of Rotterdam. While the admiral was off on the seas, his wife and little boy resided on one of his estates at Wanstead in Essex. William Penn went to school at Chigwell, nearby, where he was apparently under influences largely Puritan. At the age of 11 a strong religious conviction came suddenly upon him. "He had the strongest conviction of the being of a God and that the soul of man was capable of enjoying communication with him," an experience which profoundly influenced his future life. In 1656 the family removed to Ireland, and here young Penn was given the best of private instruction.

His boyhood days were lived during the Protectorate. The Admiral, after receiving honors and riches from Cromwell, had so timed his change of loyalty as to gather in a good share of the rewards distributed at the time of the Restoration. He was in a condition to send his son to the most aristocratic of Oxford Colleges, and at the age of nearly 16, in the year 1660, William Penn became a "Gentleman-Commoner of Christ Church." The boy was evidently tinged with puritanism; the prayer-book and the surplice savored of papacy, and he joined a little company of students in religious worship not authorized by the Established Church. An Oxford Quaker, Thomas Loe, spoke with power in the city and Penn came under his influence. The results were not exactly Quakerly, however, for in company with a friend, he forcibly tore from the backs of fellow-students the "popish rags," as surplices were called by the zealous puritans of the day.

WILLIAM PENN

For this he was, with others, expelled from the college. He went to his home and announced himself a Quaker. He was now a manly youth of 18, handsome in appearance, and of unusual intelligence. His father had intended him for a high career in the state, and no news could have been more unwelcome than this. True to his convictions, he adopted the speech and manners of the sect and attended their meetings. Exile from home followed, but this simply aroused his determination. His father's friends interceded for him, pointing out that one might rather be proud of a son who eschewed the frivolity and immorality of fashionable society of the days of Charles II. He was sent abroad in the company of persons of high degree, first to Paris, where he entered partially into the circle of fashion; thence to Saumur, the Protestant college, where he laid the foundation of that extensive knowledge of patristic literature so much in evidence in his future writings; thence touring in Italy, where he received a letter from his father calling him home in 1664. The trip had produced its designed effect and the signs of the Quaker had disappeared.

He was then entered as a student at law at Lincoln's Inn, and was given a place on his father's staff. In 1666 he was sent by his father to manage his large Irish estates. He joined the expedition to put down a mutiny in the garrison at Carrickfergus, and procured for himself a suit of armor, in which seems to have been painted the only picture of him made during his lifetime. The picture shows a handsome youth, with hair parted in the middle and long dark locks. His martial ardor was of short duration. Thomas Loe again crossed his path in Cork and Penn became a Quaker never more to falter. He was soon imprisoned with his fellows on a charge of rioting, and this was but the beginning of many and severe confinements which lasted at intervals through his life. His influence soon secured his release. His father was angered by his "thee" and "thou," which the Quakers had adopted as the language of equality, and his refusal to doff the hat, then a symbol of reverence of worship, and drove him from his house. In time they were reconciled and the Admiral on his deathbed in 1670 endorsed the course of his son.

Penn began immediately to preach and to enter into the theological controversy of his time. His supposed unsoundness on the Calvinistic interpretations of the day got him into the Tower. "My prison shall be my grave," he said to the Bishop of London, who asked him to recant as the price of liberty, "before I will budge a jot. For I owe obedience of the Conscience to no mortal man." He was soon discharged due to the influence of the Duke of York, afterward James II, with whom he enjoyed a strong friendship. 'Truth Exalted,' in 1668, was his first important publication; then followed, in the same year, 'The Sandy Foundation Shaken,' 'Innocency with her open Face,' and the most noted and valuable of his works, a book breathing the noblest spirit of Christianity, written in prison, 'No Cross, No Crown.'

In 1670 he was again arrested under the Conventicle Acts. His trial is noted in the records of English jurisprudence. With a

friend, William Mead, they were brought before the Court, upon an illegal indictment and insufficient evidence. Penn conducted the defense and the jury brought in a verdict of *not guilty*. The judge was infuriated and endeavored to browbeat them into another decision, when Penn appeared as their champion, and so enheartened them by his exhortations to firmness that they stood their ground and settled for all time the independence of juries within their proper limitations. His next important work, 'A Seasonable Caveat against Popery' (1670), brought out a principle, further elaborated in 'Great Case of Liberty of Conscience' (1671), which now became one of his guiding standards of life, universal toleration, which soon developed into perfect religious liberty. The last work was written in prison. On his release he made a trip to Holland and Germany, preaching the gospel.

He took advantage of a little surcease from jails to marry, in his 28th year, Gulielma Maria Springett, daughter of Sir William Springett, a woman of great beauty and sweetness. A declaration of indulgence for dissenters issued by Charles II, in 1672, now made his life easier, and with an estate of £1,500 a year left him by his father, he settled at Rickmansworth, in Hertfordshire. He was active for a few years in preaching his doctrine through England by tongue and pen. The indulgence was soon revoked and Penn began the work in which we find him engaged largely through life, of securing releases, by his influence at court, for his suffering friends. In 1675 he wrote a 'Treatise on Oaths,' explaining why Quakers refused to take them. Another soon followed, 'England's Present Interests Considered,' a work devoted to showing the history and progress of civil liberty in the kingdom.

In 1675 his thoughts were first seriously turned to America. Lord Berkeley and Sir George Carteret, who had received from the Duke of York the promise of New Jersey, sold the western half to two Quakers, John Fenwick and Edward Byllinge. They had some difficulty between themselves in the settlement of their relative claims and asked William Penn to arbitrate the matter. Byllinge afterward becoming embarrassed, transferred to Penn and two others his interest for the benefit of the creditors. West New Jersey was opened for sale and the persecuted Quakers found there a haven of rest. Penn wrote to Richard Hartshorne, a settler whom he appointed his agent, "We lay a foundation for after ages to understand their liberty as men and Christians, that they may not be brought in bondage but by their own consent; for we put the power in the people." The colony prospered greatly under the management of Penn and his friends. In 1677 he established his family in Worminghurst, in Sussex, on an estate owned by his wife. In company with George Fox, Robert Barclay and others, Penn paid a religious visit to Holland and Germany. Here he made a convert of the Princess Elizabeth Palatine, granddaughter of James I, a woman of great intelligence, learning and spirituality, who became a devoted adherent and correspondent. More important, historically, however, he began that acquaintance with the Rhine Valley which resulted in a great emigration of its inhabitants to Pennsylvania, in the following century. His journal of the

trip is among his printed works. When he returned he found persecution breaking out anew, many of his friends in jail and their estates confiscated. The plea was that the Papists were intended to be the sufferers and the Quakers were drawn in incidentally. Penn published a plea for liberty, even for Papists—a sentiment which, in that day, required no small courage—and gave rise to a report, from which he afterward suffered greatly, that he was a Jesuit in disguise. In 1679 he wrote an 'Address to Protestants of all Persuasions' to promote general morality, also an address to William, Prince of Orange, on behalf of certain dissenters in Holland. He also became interested in political affairs, identified himself with the Whig party and worked in behalf of the Parliamentary candidacy of the republican Algernon Sidney. He enjoyed great favor at court. His rank, wealth, courteous manners and strong personality gave him much influence, while his Quaker customs and speech seem to have been regarded with good-natured tolerance. This influence he continually exerted for the aid of his suffering brethren and his advocacy of his favorite doctrine of universal toleration. The rest of the life of Penn belongs largely to the history of Pennsylvania. Before entering on this it is well to mention a few of the principal writings of the following years. 'Examination of Liberty Spiritual' appeared in 1681; 'Persuasive to Moderation,' in 1686; 'Fruits of Solitude,' in 1692, being a perfect treasury of wise advice, so that it has recently sprung into fresh popularity and many editions in England and in America, having been a favorite of Robert Louis Stevenson; and about the same time a comprehensive 'Essay towards the Present and Future Peace of Europe,' being a suggestion for an international parliament which has been the basis of a movement culminating in the Hague tribunal; 'Rise and Progress of the People Called Quakers,' in 1695; 'Primitive Christianity Revived,' in 1696. His preaching whether in England or America was incessant. His influence at court, strong under Charles II, was ascendant under James II, suffered an eclipse under William and Mary, and recovered itself under Anne.

He had inherited from his father a claim of £16,000 against Charles II for money loaned and services rendered. In 1680 he asked the payment of this claim in lands in America. The king was willing to be so easily released from a troublesome debt and to satisfy an influential friend. Penn saw an opportunity, for which his New Jersey experience had prepared him, to found a Christian commonwealth devoted to liberty, peace and justice, and to secure a place of rest for his persecuted co-religionists. The deed was signed on 4 March 1681. It made William Penn governor and proprietor of "Pennsylvania," a vast tract, intended to be three degrees in latitude and five in longitude. It was described as bounded on the east by the Delaware River, on the west by Maryland and to extend as far northward "as plantable." He could sell the land on his own terms and to whom he would. He could fix the government, make the laws—subject to the assent of the freemen—appoint magistrates and judges, levy taxes, control the military forces and grant pardons and reprieves, though in all these powers

the Crown reserved a veto. He now went to work with great energy to settle his colony. A few Dutch and Swedes were already on the banks of the Delaware and some English Quakers had drifted over from West Jersey, while the Indians roamed the woods. He addressed these inhabitants, promising them, "You shall be governed by laws of your own making," and sent out his cousin, William Markham, as his deputy. The impossibility of laying out the province in accordance with the terms of the royal grant became manifest as soon as a few latitudes were taken and the long controversy between Penn and Lord Baltimore, continued by their heirs, was not settled for nearly a century. It interfered sadly with Penn's plans for living in his province, and produced bickerings and hard feeling, at times verging on war.

He pushed sales with vigor and immediately the colonists began to arrive. But the subject on which his heart was most set was the "Frame of Government." His first "frame" was extreme republicanism. He abolished primogeniture, gave all the power to the people to initiate the repeal laws, reserving no veto for himself. All taxes were to be collected by law, the courts were to be open to all and no oaths required; penalties were to be light, capital punishment abolished except for murder (the more remarkable, as at this time, there were enumerated 200 capital offenses in the English law); prisons were to be workhouses and all children taught a useful trade. All who professed faith in Jesus Christ were to be eligible to office and all who confessed an almighty God were to have free exercise of their worship. This "frame" showed the working of Penn's mind and probably better expressed his ideas of government than those which followed. In some respects it was modified, but to the one feature of wide religious liberty he adhered with tenacity in the face of considerable opposition. He had pleaded for it in England when a member of a persecuted sect; as the ruler of a State he would be true to his ideals. Leaving behind a beautiful letter to his wife and children, which has been extensively published, he sailed with about 100 others, most of whom were Quakers, for America. On 27 Oct. 1682 he landed at New Castle. This was also his territory, for the Duke of York had transferred to him the land of the present State of Delaware. Stopping at Chester, he went leisurely up the river to the new city which he had named Philadelphia, then partly laid out, and the scene of great building activity.

The celebrated treaty with the Indians was probably made in the summer or fall of 1683. Penn was continually meeting tribes, buying land and cementing friendships. His fairness and liberality won their hearts. At various times he bought all of southeastern Pennsylvania, in sections stretching from "creek" to "creek" and running up into the country a distance measured by the length of one or two days' walk. One of these treaties was held at Shackamaxon (now Kensington) and has been immortalized by West on canvas and Voltaire in print. Penn spent nearly two years in Pennsylvania. He met legislatures and preached in the Quaker meetings, sold land in the country and developed his city, settled disputes and established courts, and hospitably entertained white and red men. The claims of Maryland

were being pressed in London and on 12 Aug. 1684 he embarked for England, expecting to make a brief stay and to bring his family permanently to Pennsylvania.

James II, the great friend of Penn and his father, came to the throne shortly after his arrival and Penn strove to use his influence for persecuted dissenters. As this would embrace Roman Catholics, James at first assented and 1,400 imprisoned Quakers were set free; but political measures demanded the re-enactment of the offending measures and Penn became a courtly intercessor for all sorts of favors. This lasted till the revolution of 1688, except for a second visit to Holland and Germany on a diplomatic mission for James, which Penn turned to religious advantage also, preaching everywhere. From this trip sprang the great emigration of Germans into the Penn province during the early 18th century. Upon the accession of William and Mary, conditions radically changed. All friends of the Stuarts were suspects. Twice Penn was arrested on charges of treasonable correspondence with the banished king and twice acquitted. After each release he began to make preparations to return to Pennsylvania, where his presence was greatly needed to compose the factional differences which had arisen. On his return from the funeral of George Fox, in 1690, he heard that he had been accused again by one Fuller, whom the Parliament afterward pronounced "a cheat," and that a warrant was out against him. He might have gone to America, but he would not under suspicion. He allowed the vessel to sail without him and went into hiding in London. This condition lasted about three years. Various treatises issued from his pen. His friends found him to converse and his opponents to argue theological points, but technically he could not be found by the king's officers. Finally, in 1693, three lords presented his case to King William, giving the assurance that there were no real charges against him. An examination was had and Penn was set at liberty. In the meantime his wife had died. The province and the territories, as Pennsylvania and Delaware were respectively called, were demanding separation from each other, and an apostate Quaker named George Keith, was making an ecclesiastical and political turmoil. In 1692, to add to his other troubles, his executive authority was taken away and given to Benjamin Fletcher, governor of New York, who was totally out of sympathy with the people of the province. Upon Penn's release, his powers were returned to him. In 1696 he married Hannah Callowhill of Bristol. This event was followed by three years of undisturbed ministerial labors which drew around him great crowds of all kinds of people. Finally, on 9 Sept. 1699, he fulfilled his long delayed plan and sailed for America with his family, intending to make it his permanent home. He at first took up his residence at Philadelphia; but when in the country before he had built on his estate at Pennsbury, Bucks County, on the banks of the Delaware, a house of some size. This he now furnished with elegance and in 1700 made it his abode. It was, however, so far from Philadelphia that he found it more convenient to spend his time mainly in that city. He busied himself with affairs of State and Church and the effect of his personal force and wisdom was soon felt in a more wholesome and united feeling in the

little colony. But before two years had expired a movement in England to annex all the proprietary governments to the Crown seemed to demand his presence there. Prior to his sailing he gave the colony a new constitution under which it prospered for 75 years, till the Revolution. He chartered the city of Philadelphia and its principal school, he eloquently urged the politicians to stop their petty quarrels and unite for the good of the State, and leaving his interests largely in the hands of James Logan, on the 3d of November 1701 he and his wife sailed for England, never again to see their colony. The following 10 years of Penn's life were years of turmoil and disappointment, due largely to his own failure to judge character. His appointees to the position of deputy governor, one of whom was his son, were thoroughly unsuited to the task and fomented trouble in the colony, which was fanned by an opposing leader, named David Lloyd. Except in so far as they made Penn's life miserable, they belong rather to the history of the province than to his biography. Still more serious in its personal effects was the financial difficulty incurred by his trust in a tricky steward. Claim after claim was made and allowed without investigation, until finally his whole interest in the province was mortgaged. Finally, rather than pay the fraudulent demand, he allowed himself to be taken to a debtor's prison, where he remained nine months. The matter was compromised by his friends and the claims pared down and discharged.

A little gleam of comfort came over his declining years. His colony, in 1710, came to its right mind, placed his friends in power, and showed its appreciation of his sacrifices for them. During the colonial days ever afterward his name was held in highest honor. The most serious of his financial difficulties were past, and yet his great fortune was gone. He was seriously contemplating selling his interests in Pennsylvania to the Crown, when, on 4 Oct. 1712, in the midst of a letter to Logan, a paralytic stroke came upon him, depriving him of his memory as well as his power of locomotion. His wife gave herself energetically and successfully to his business affairs. He lingered with gradually decreasing mental powers, but with a composed mind, till 1718, when on 30 July he died in his 74th year. Penn was a prolific writer and many of his essays were translated into Welsh, Dutch, Danish, French and German. A collection of his works was published in 1726, with a biography by Joseph Besse, considered the most authoritative of all. Other collections were published in 1771 and 1782. A collection of 'Select Works,' edited (supposedly) by John Fothergill, in 3 vols., was published in London by Phillips in 1825. Consult Buell, A. C., 'William Penn as the Founder of Two Commonwealths' (New York 1904); Clarkson, T., 'Memoirs of the Private and Public Life of William Penn' (2 vols., Philadelphia 1813); Dixon, W. H., 'History of William Penn, Founder of Pennsylvania' (London 1872); Fisher, J. F., 'The True William Penn' (Philadelphia 1900); Hodges, G., 'William Penn' (Boston 1901); Weems, J. B., 'The Life of William Penn' (Philadelphia 1836).

ISAAC SHARPLESS,

*Dean of T. Wistar Brown Graduating School,
Haverford College, Haverford, Pa.*

PENN COLLEGE, a coeducational institution, located in a campus of 25 acres in the northern edge of the city of Oskaloosa, Iowa, under the control of the Friends. In 1866 the Society of Friends made an agreement with the Spring Creek Union College Association by which they had a right to conduct the affairs of the college in accordance with the principles of their society, and in 1873 Spring Creek Union College became Penn College. Four collegiate courses are offered, classical, classical-biblical, scientific and philosophical, for the completion of which the degrees of A.B., B.S. and Ph.B. are conferred. There is also a school of music, a school of commerce, a school of domestic economy, and courses in biology, agriculture and manual training, as well as a preparatory department. A summer session has recently been established. The college possesses a fine art collection and a large museum. In 1918 the library contained 10,000 volumes; the grounds and buildings were valued at over \$80,000; the amount of the productive funds was \$272,000; the annual income \$78,000. The students numbered 555, and the faculty 30.

PENN VS. BALTIMORE, in American history, a case involving the boundaries between Penn's and Lord Baltimore's land grants from the English Crown. Penn obtained a new grant in 1682 from the Duke of York, reaching into Delaware and Maryland; also a letter from the king requesting Baltimore to hasten the adjustment of the boundary. The dispute was as to the boundary line of Maryland in the peninsula between Delaware and Chesapeake Bays, and descended to the sons of Penn, Thomas and Richard, before it was settled. The case was taken to London and decided in Penn's favor. A compromise was arranged in 1732, and enforced by the Court of Chancery in 1760, in accordance with which a line was run by Mason and Dixon, fixing the boundary in 1766.

PENN YAN, pěn yán', N. Y., village, county-seat of Yates County; on Keuka Lake at its outlet, and on Pennsylvania and New York Central railroads, 45 miles southeast of Rochester. It was first settled in 1800, and the village was incorporated in 1833. As some of the settlers were from Pennsylvania, while others were known as "New England Yankees," discussion arose as to the name of the village, but both parties were finally satisfied by the adoption of the present name, Penn Yan, made up from the first syllables of Pennsylvania and Yankee. It has daily steamboat connection with Hammondsport at the head of the lake, and is the trade centre of the largest grape growing region in the Eastern States. The lake outlet affords excellent water power for mechanical industries; and the manufactures include lumber, flour grape juice, fruit baskets, paper, carriages, machinery and metal manufactures. It is a shipping point for great quantities of excellent ice harvested on the lake. It is the site of the Penn Yan Academy, a public high school, founded in 1859, and free to all residents of the district, and a Roman Catholic parish school. Of recent years it has been a popular summer resort. Pop. (1920) 5,215.

PENNACOOK (pen'a-kuk) **INDIANS**, a tribe of North American Indians which in the 17th century occupied both banks of the Merri-

mac River in New Hampshire for some miles above and below where Concord now stands, and which was the site of their principal village. They were the most powerful and influential of the tribes which formed the Pennacook Confederacy, an association of New England tribes of the Algonquian family, who formerly resided in southern New Hampshire, northeastern Massachusetts and southern Maine. The tribes composing the Confederacy were Agawam, Wamesit, Nashua, Souhegan, Amoskeag, Pennacook proper and Winnepesaukee. The first three named were Massachusetts Indians. Other tribes were so closely affiliated with the Confederacy as to be commonly grouped with them: the Wachuset, Coosuc, Squamscot, Winnecourt, Piscataqua and Newichawanoc tribes, but these were not full members with the first named. They made numerous early treaties with the English, but later their alliances were with the French. At one time they were reported to number upward of 4,000, but by 1630 smallpox and disease had reduced this number to 2,500, and in 1674 they were counted as 1,250. Two of the Pennacook tribes, the Nashua and the Wachuset, joined in the King Philip's War of 1675, but the others remained friendly to the whites until some 200 of their number were treacherously seized by Waldron in 1676. Most of them fled to Canada, but some went westward and settled at Schaghticoke, N. Y. In 1700 the scattered remnants of the race gathered at Saint Francis in the province of Quebec, and there their descendants reside.

PENNALISM, an ancient system of tyranny exemplified in torments and impositions to which the elder students (Schoristen) in German Protestant universities used to subject the younger ones, called *Pennales* (pencases), afterward foxes, *Neovisti, cæci* (blind), *vituli* (calves), *innocentes* (guileless), *imperfecti*, *Galli domesticii, dominastrii*, etc. This abuse was carried to a great extent; and books written 200 years ago depict its real barbarism. Whatever the pennals possessed, they had to give up to the schorists, who compelled them to do the most menial services, made laughing-stocks of them, beat and ill-treated them, and all this had to be endured without complaint for one year, when the ceremony of deposition followed. This consisted of a series of symbolical trials (knocking off horns previously put on the pennal's head, combing his hair with a rake, etc.), indicating generally the purgation from impurity and consecration to an intellectual life, after which the former victim became the tyrant of the classman below him. Pennalism was an extreme development of the practice of hazing in the colleges of that day, but degenerated among German students to practices so nearly criminal that in 1661 and 1663 the German empire enacted laws against pennalism in Jena, Frankfurt, Rostock, Wittenberg, and later in Leipzig and Giessen.

PENNAMITE WARS. The three conflicts known as the Pennamite wars resulted from the very common error in Colonial times of making royal grants in England which overlapped when they came to be worked out on the ground in America. In the drawing of the charter for Connecticut by Charles II in 1662, the grant was made to include "all the lands lying west of it from sea to sea." At that time no conception of

the breadth of the continent obtained among the men who were thus laying out grants of land in the new country. In 1681 in the charter given to William Penn, the tract conveyed overlapped the "lands west" of Connecticut, by that part of Pennsylvania lying between the parallels of 41° and 42° north — nearly two-fifths of the whole Penn tract.

The people of the Connecticut colony in the prosecution of a colonization scheme sent out explorers in 1750, who traveled as far west as Ohio. The Woyomack, or as it afterward came to be called, the Wyoming Valley, with its broad fertile bottom, 21 miles long and three miles in width, watered by the beautiful Susquehanna River, received the highest commendation in their reports, and the Susquehanna Company of Hartford was formed to settle a colony there. These lands were at that time supposedly the "property" of the Indians of the Six Nations, and a delegation was sent from Connecticut to Albany, the headquarters of these Indians, to purchase their rights in the Wyoming Valley. The bargain was made, and the price of 2,000 English pounds was duly paid to the Indians. When the Susquehanna Company undertook to place a colony on these lands the settlers were attacked by emissaries of the Penn family, who were striving to hold the lands of Pennsylvania in perpetual fee, and issuing leaseholds only to would-be purchasers. This feudalism was resented by the Pennsylvania settlers, who took sides with the Connecticut settlers and fought the Penn faction. The first battle in which blood was spilled occurred in 1769, and there were several bloody conflicts up to the spring of 1771, when the Penn retainers were thoroughly beaten. This ended the first "war," and there was peace until 1774, when a force of 700 men was gathered by the Penns and sent against the Wyoming Valley settlers, who then numbered many Pennsylvanians among their landowners. The colonists met the Pennamites with about 350 and administered a decisive defeat, after many had been killed on both sides. And thus ended the second Pennamite War. Following the conclusion of the Revolutionary War and the organization of the several States, Congress was asked to decide whether the Wyoming Valley section belonged rightly to Connecticut, who claimed it under the original grant. The decision was in favor of Pennsylvania, and Connecticut was allowed to take a section (afterward known as the Western Reserve) of what is now the State of Ohio, and was then the "Northwest Territory," by way of recompense. The third war now came on. The new State of Pennsylvania rejected the plea of the Wyoming Valley colonists that they had bought their holdings in good faith, and sent two companies of the State militia to drive them out. This they did with considerable severity. The people of Pennsylvania resented this action and sent a sheriff's posse to bring back the evicted settlers. A band was hastily gathered, which included many Pennsylvanians, and the militia were attacked and many were killed on both sides. For some years these conflicts continued, with much bloodshed, and finally the trouble was ended in 1807 by the confirming of the settlers in their holdings upon payment to the State of Pennsylvania of trifling sums to cover the cost of recording the papers. Consult Chapman,

I. A., 'A Sketch of the History of Wyoming' (Wilkes-Barre 1830); Hayden, H. E., 'Bibliography of the Wyoming Valley, Pa.' (Wilkes-Barre 1885).

PENNANT, pen'ant, Thomas, English traveler, naturalist and litterateur; b. Downing, Flintshire, Wales, 14 June 1726; d. there, 16 Dec. 1798. He was educated at Oxford, and early made a specialty of the study of minerals and fossils, first attracting attention by an account of an earthquake felt in Flintshire in 1750, which was published in the 'Philosophical Transactions' in 1856. He served as high-sheriff of Flintshire in 1761. He made scientific tours of the British Isles of which he published delightfully readable accounts, and in 1767 was elected a member of the Royal Society. Though not a profound scholar he acquired a considerable reputation as a naturalist, and had a very wide circle of readers owing to his attractive style. His literary output was immense and covered many popular subjects outside of his chosen scientific labors. Among his works are 'British Zoology' (1766); 'Synopsis of Quadrupeds' (1771); afterward enlarged to the 'History of Quadrupeds' (1781); 'Genera of Birds' (1773); 'Indian Zoölogy' (1781); 'Arctic Zoölogy' (1784); 'Of London' (1790); 'The Literary Life of the late Thomas Pennant, Esq. By Himself' (1793); 'History of the Parishes of Whiteford and Holywell' (1796); 'Outlines of the Globe,' two volumes of which were published before his death, and two afterward (1798-1800).

PENNANT, the name given a small flag or banner, generally used on vessels or nautical stations. Pennants are made of various shapes, and the shape and arrangement indicate the rank of the chief officer on board of the ship which wears them, or the number of the ship, the presence or absence of the officer in command, etc. The pennant is usually very long as compared with its width and tapers to a point. In some instances it is only about twice as long as its width, and the free end is cut into a swallow-tail. This form is called the "broad pennant," and its edges may be parallel to indicate one rank, or taper to the two tips to indicate another. Again, the pennant may be very short, so as to present an almost equilateral triangle.

PENNANT'S MARTEN. The Canadian "pekan," "fisher," or "black cat," the largest of the martens, 24 to 30 inches long and with a black tail 14 to 18 inches long. The fur is generally a brownish shade of black about two inches in length, and is highly esteemed under the commercial title of "American sable." The animal was formerly found plentifully in the United States but is now limited to Canada. See MARTEN.

PENNATULIDÆ, a family of alcyonarian coral-polyps: the sea-pens (q.v.).

PENNELL, pen'el, Henry Cholmondeley, English poet and sportsman; b. in London, 1837; d. 1915. He entered the public service in 1853. After serving in various departments of the admiralty, he was made Inspector of Sea Fisheries in 1866, where he served until he was selected in 1875 to carry out commercial reforms for the khedive of Egypt. Upon his return he was appointed director-general of interior commerce. He was an expert marksman winning

the Grand Prix of Monaco and the Universal Championship for his shooting. Among his well-known books of verse are 'Puck on Pegasus' (1861); 'The Crescent' (1866); 'Modern Babylon' (1873); 'The Muses of Mayfair' (1874); 'From Grave to Gay' (1885). On angling and ichthyology he has written among other works 'The Angler-Naturalist' (1864); 'The Book of the Pike' (1866); 'Fishing Gossip' (1867); 'The Modern Practical Angler' (1873); two volumes in the 'Badminton Library'—'Salmon and Trout' and 'Pike and Other Coarse Fish' (1885); 'The Sporting Fish of Great Britain' (1886), etc. He was for some years editor of the *Fisherman's Magazine and Review*.

PENNELL, Joseph, American etcher and illustrator: b. Philadelphia, 4 July 1860. He studied in the Pennsylvania School of Industrial Art and the Pennsylvania Academy of Fine Arts. He began illustrating for the *Century Magazine* in 1881, and has been a frequent contributor to it and similar magazines ever since. He executed an important series of etchings to accompany the papers on Italian life, by W. D. Howells, and also a long series on English cathedrals published in conjunction with Mrs. Schuyler Van Rensselaer's book on that subject. He has also illustrated several books of travels written by his wife, Elizabeth Robins Pennell, and is himself the author of an important work on 'Pen Drawing and Pen Draughtsmen' (1889). He is also the author of an extensive series of works, among them 'A Canterbury Pilgrimage' (1885); 'An Italian Pilgrimage' (1886); 'The Jew at Home' (1892); an introduction on the art of the illustrator to Vièrgue's 'Pablo de Segovia' (1893); 'Modern Illustration' (1895); 'The Illustration of Books' (1896); 'The Alhambra' (1896); 'The Work of Charles Keane' (1897); 'Lithography and Lithographers' (1900); 'Life of James McNeill Whistler' (with Mrs. Pennell, 1910); 'Pictures of the Panama Canal' (1912); 'The Wonder of Work' (1916). He has been lecturer on illustration at the Slade School of Art, University College, London, and at the Royal College of Art, South Kensington. He has been the recipient of a very large number of awards and prizes and many gold and silver medals. He won the Grand Prize at the Saint Louis Exposition in 1902; the Grand Prix at Milan in 1906; the Grand Prize at London in 1913 and the Grand Prize at Florence in 1915. He has representative works at Luxembourg; in the city of Paris collection; in the Uffizi Gallery, Florence; the Modern Gallery, Venice; the Modern Gallery, Rome; the Berlin National Gallery; the British Museum; the South Kensington Museum; the Guildhall Gallery, London, and also at Dresden, Budapest, Munich, Melbourne, Perth and Adelaide.

PENNSYLVANIA (the "Keystone State") is the southernmost of the group of the North Atlantic States. The sobriquet, Keystone State, was appropriately given to the commonwealth which occupied the centre of the arch formed by the original 13 States. Its area (land surface only) is 45,126 square miles. In general outline Pennsylvania is a rectangle, having one irregular side formed by the Delaware River and a triangular projection at its northwestern corner extending northward to the shore of

Lake Erie. The segment of a circle with a radius of 10 miles drawn from the courthouse at New Castle, Del., cuts a small piece from its southeastern corner. Pennsylvania is 158 miles wide between two parallels of latitude, constituting its northern and southern boundaries, and 302 miles long, measured from the Ohio State line to either of two points on the Delaware, one opposite Port Jervis, N. Y., and the other at Bordentown, N. J., where the river makes its two far eastward bends. Pennsylvania adjoins New York on the north, New York and New Jersey on the east, Delaware, Maryland and West Virginia on the south and West Virginia and Ohio on the west. Its north-west corner lies directly on Lake Erie.

Topography.—The ridge of the Alleghenies divides the State into two nearly equal parts, popularly known as eastern and western Pennsylvania. About one-fourth of the surface is a plateau of an average elevation of nearly 2,000 feet above sea-level, comprising the tier of counties abutting on the northwestern slope of the Alleghenies and the northernmost two tiers of counties from the Delaware to Lake Erie. The plateau descends gradually southward and westward into Ohio. Between the Alleghenies and the Blue or North Mountain range and filling the central part of the State is a complexity of interlocked ridges and valleys curving in parallel lines from the southern boundary northeastwardly. At the foot of the steep wall of the North Mountain, like a moat before a fortress, lies the "Great Valley" of the early settlers, which extends from the Hudson River to central Alabama and is known by many names; in Virginia as the Shenandoah, in New Jersey as the Kittatinny and in Pennsylvania as the Lehigh, Lebanon or Cumberland Valley. It is from 10 to 20 miles wide (in this State), and is limited on the southeast by the South Mountain range. Through the break in this range between Harrisburg and Reading the Great Valley merges into the open country of the southeast. All the ridges of the Appalachian system undergo a considerable lowering before entering the State. The Catskills of New York with summits exceeding 4,000 feet become in Pennsylvania the Pocono Plateau with no elevations greater than 2,000 feet; the Blue Ridge of Kentucky with peaks reaching an altitude of 7,000 feet enters this State as the South Mountain range, which scarcely anywhere attains the height of 2,000 feet, and disappears entirely a little to the west of Harrisburg. It rises again in a ridge of not over 1,000 feet high at Reading, and, passing into New Jersey, becomes the highlands of the Hudson with summits of 3,000 feet. Only a few knobs of the Alleghenies rise to an altitude of 2,700 to 2,800 feet and the North Mountain range, with its narrow, rocky crest, is of the almost perfectly uniform height of 2,000 feet. While destitute of high mountains the surface of the State is everywhere more or less hilly. The southeastern quarter of the State, though but little above sea-level, is a rolling country, and the western section is deeply furrowed by water-courses and broken by short ridges. Western Pennsylvania contains two distinct ranges, Laurel Hill and Chestnut Ridge, running parallel from southwest to northeast about 10 miles apart and enclosing the Ligonier Valley.

Rivers.—The table-land of central and

northern Pennsylvania forms the water parting. A small quantity of the rainfall is drained southward through the Potomac, and a still smaller part is carried away northward by the Genesee River into Lake Ontario. The three great drainage systems are those of the Ohio, the Susquehanna and the Delaware. Beginning with the Water Gap in the Pocono Plateau the otherwise unbroken wall of the North Mountain is pierced by five gateways through which flow, in the order named, the Delaware, the Lehigh, the Schuylkill, the Swatara and the Susquehanna. The Delaware drains only three northeastern counties of the State, the Lehigh enters the former river at Easton, after draining parts of Carbon and Monroe counties and passing in its course the conical mountain at Mauch Chunk, one of the most familiar landmarks of the country. The Schuylkill drains the remainder of the lower anthracite regions and joins the Delaware at Philadelphia. The Brandywine, the lowest of the Delaware's tributaries, may be here mentioned for its historic interest. It flows through the Chester Valley in Pennsylvania and debouches at Wilmington, Del. The Swatara is an inconsiderable stream, but its water gap is like the others mentioned. The Susquehanna divides at Sunbury into two main branches, which spread their watery tentacles over the whole country from the Mohawk Valley in New York to Cambria County in western Pennsylvania. Ascending the North Branch 50 miles, one enters the Valley of Wyoming through another grand mountain gate. Central Pennsylvania is drained mainly by the Juniata, the largest tributary of the Susquehanna and the most picturesque river in the State, winding through this topographical labyrinth, now laughing in the sunlight of a broad valley and then rushing darkly between frowning and over-hanging cliffs. The drainage system of western Pennsylvania is constituted of the Allegheny and the Monongahela and their affluents. The former flows alternately southwest and southeast, and at Pittsburgh is joined by the latter, which rises in Virginia and has a northward course of 80 miles within the State, the united streams forming the Ohio. The Conemaugh, which collects the waters of the highlands west of the Allegheny at Johnstown, and the Youghiogheny, which, like the Monongahela, rises in Virginia, cut through the Laurel Hill range, and, after crossing the Ligonier Valley, break in similar fashion through Chestnut Ridge; the four gorges each rising almost vertically 1,200 to 1,300 feet from the river beds to the mountain tops. The Conemaugh and Loyalhanna unite at Saltsburg, forming the Kiskiminetas, which joins the Allegheny at Freeport; the Youghiogheny joins the Monongahela at McKeesport.

Climate.—The climate of southeastern Pennsylvania is comparatively mild; zero weather is of rare occurrence. The Alleghanies act as a wind break and protect the eastern valley from the northwestern cold waves. The lower Delaware is often filled with ice, mostly drift ice from above and, though navigation is sometimes impeded, it is never closed. Above Philadelphia the river is frozen solid about once in four or five years. The cold spell is usually broken by one or two midwinter thaws. The summer temperature of southeastern Pennsylvania is often above 90° F. in the mid-

dle of the day and the humidity makes the heat very oppressive. The winters in the central and northern mountain regions are quite rigorous, but the summer temperature is more moderate than that of the southeastern part of the State, owing to the elevation and comparative dryness of the atmosphere. The western part of the State has the climate common to the Lower Lake regions. From observations taken at the agricultural experiment station in Centre County for 16 years (1866-1902) the annual rainfall ranged from 30.28 to 43.88 inches. The average monthly temperatures for January ran from 18° to 36.60° F., and the average for July from 65.40° to 76.16°.

Geology.—The geological division of the State coincides with the popular geographical division thereof into eastern and western Pennsylvania; the ridge of the Alleghanies being the divisional line. Western Pennsylvania belongs to the geological province of the Mississippi Valley, and is one vast field of bituminous coal, overlaid and underlaid by Carboniferous sandstone and conglomerate. The uppermost and most valuable of the bituminous coal measures is the Pittsburgh; and from the outlying remnants of the same found on the Broad Top Mountain and in Maryland, and also from the identification of the Pittsburgh with one or two of the deposits of anthracite in northwestern Pennsylvania, it has been conjectured that this coal had its origin in a growth of swamp vegetation almost coextensive with the State. The original northern limit of the Pittsburgh bed in the direction of Lake Erie is now undeterminable, for the whole Allegheny Valley and the upper Susquehanna Valley has been denuded of the same by those slow but potent levelers, frost and rain, though the middle and lower coal measures in these regions have been preserved. Going northward, the middle and lower beds consecutively disappear, until only patches of the lowest workable deposits maintain a precarious existence on the highest land; and in the extreme north the old red sandstone of the Catskill (Devonian) formation, which underlies the Carboniferous sandstone, is exposed in broad bands along all the watercourses. Eastern Pennsylvania belongs to the geological province of the Atlantic seaboard and is partly a region of mountains of Devonian and Silurian age and partly an open country of the still older Cambrian and Archæan periods. A broad continuous belt of Jurassic-Triassic brownstone and trap crosses the latter from west to east, and Cretaceous rocks underlie a narrow strip along the Delaware, below Trenton. A sheet of glacial drift covers the northern part of the State down to a line drawn from Belvidere, N. J., to Olean, N. Y., and curving from the latter place through Warren, Venango and Beaver counties to a point on the western State line, a few miles north of the point of exit of the Ohio River. On the Pocono plateau, in the northeastern section of the State, the old red Catskill sandstone occupies nearly the entire surface. Within a deep trough in the otherwise horizontal outspread of the Catskill formation lie the anthracite deposits of Luzerne County, the best preserved in the State; for so deep is this trough that not only the lower and middle measures and the measure identified with the Pittsburgh have been saved, but there are still higher coal

beds, and above these remnants of still higher rocks, containing Permian fossils found elsewhere in the State only in its extreme southwestern corner. The coal beds of the lower anthracite region lie in a series of parallel folds and rise steeply to the soil at their edges; the inclination of one bed being opposite to that of the bed in the next pocket. An arch described in the direction of an ascending seam and down again in the direction of descent of the next following would rise thousands of feet in air; and this aerial arch would represent the amount of erosion which the strata underlying the coal and the coal measures themselves have undergone. It is estimated that only one ton in a hundred of the original deposits of anthracite has been preserved. Another illustration of the stupendous changes wrought in the topography of Pennsylvania by the frosts and rains of ages is found in the region of the Alleghanies. Wherever the Carboniferous formations (which once covered the entire surface of the State) have been preserved in geological basins, there are the mountain ridges of to-day; where these formations were arched they have been eroded away and their places taken by the valleys of the present time. The Catskill sandstone crops out beneath the Carboniferous escarpment of the Alleghanies on the western side of the Nittany Valley, for instance, in a bold bluff. The same formation is recognizable with an opposite dip on the Broad Top, 20 miles to the east. The lower Devonian and Silurian rocks crop out in their regular order on the flanks of both mountains, and in the valley between; and an arch connecting the old red sandstone bluff with the same formation on the Broad Top would reach an altitude of 21,760 feet at its keystone line, if the measured thickness of the sandstone itself and of the underlying strata be added together. If to these one should add the thickness of the overlying Carboniferous strata, up to and including the Pittsburgh coal bed (which has been preserved on the Broad Top), the total height of these primordial mountains, which have been dissolved in the weathering process of millions of years, would appear to have been over five miles.

Mineral Resources.—Pennsylvania far surpasses any other State in the value of its mineral products. It produces nearly half of all the coal mined in the United States and contains the largest deposits of anthracite to be found anywhere in the world. The production of this variety of coal was about 25,000,000 long tons in 1880; about 50,000,000 long tons in 1900 and now averages about 80,000,000 long tons a year. When mineral fuel was first substituted for charcoal in the blast furnaces only anthracite was used, and for many years the quantity of bituminous coal so employed was relatively small. Since 1875 this relation has been gradually reversed. In 1880 bituminous coal and coke pig iron constituted 35 per cent of the total production; in 1890 it was 61 per cent, in 1900 over 76 per cent and now it constitutes practically the whole output. In the making of steam for motive power in the manufacturing and transporting industries and in the production of illuminating gas, bituminous coal has supplanted anthracite; and the use of the latter is being more and more limited to household purposes.

The most important of the bituminous coal measures of the State is the Pittsburgh in Fayette, Westmoreland, Allegheny and Indiana counties. The bed varies in thickness between 6 and 12 feet, and in the quantity of fixed carbon from 59 to 64 per cent. The production of bituminous coal in Pennsylvania increased from 18,425,163 tons (2,000 pounds) in 1880 to 42,302,173 tons in 1890, and 79,842,326 tons in 1900. Since then the production of bituminous coal in Pennsylvania has increased by leaps and bounds. The output rose to 173,781,217 tons in 1913 and, though production has fluctuated under influence of the abnormal conditions prevailing during some seasons, an estimated annual output of 170,000,000 tons, which was the product of Pennsylvania's soft coal mines in 1920, probably, would not be far from correct. This would mean a nearly ninefold increase in the annual production of bituminous coal in the State during the past 35 years. In the production of coke Pennsylvania continues far in the lead. A considerable proportion of the coke produced in the United States is made in ovens or retorts operated by large corporations that not only mine the coal and make the coke but also operate blast furnaces and steel mills which consume their entire coke product. Much coke, moreover, is a by-product of the gas and other industries. Under these circumstances accurate statistical information, either as to output or values, is difficult to obtain and tabulate. From a collection of the most reliable data it appears, however, that out of a total of from 50,000,000 to 62,000,000 tons of coal consumed per year in the United States in the manufacture of coke 60 per cent is coked in Pennsylvania. Connellsville is the centre of coke production. New installations are rapidly superseding the bee-hive coking ovens and by-products exceeding in value the coke produced will ultimately be saved. Oil was first struck in the vicinity where Titusville now stands on 29 Aug. 1859. Within the next few years hundreds of wells were drilled in the Oil Creek region. The wildly speculative character of the business in its booming days is reflected in the range of petroleum prices from \$19.25 a barrel in January 1860 to 10 cents a barrel in January 1862. The first oil fields have long since become exhausted and, though others have been successively discovered and worked, the State is now outranked as a producer by several States in the Middle Western, Southwestern and Pacific Coast oil fields. In 1922 Pennsylvania's marketed output of crude petroleum amounted to 7,443,000 barrels, which was about 1.36 per cent of the total for the United States. In the total value of its product, however, Pennsylvania still ranks high among the States. Its 1921 output brought \$24,746,000 (or over \$3.00 per barrel) whereas the 15 times greater California product for that year brought not quite nine times as much. In 1921 Pennsylvania produced natural gas to the value of \$32,815,000, which was nearly one-sixth the value of the total output of the United States. At the present time Pennsylvania ranks third among the States in the production and consumption of natural gas, its output in 1921 being 86,144,000 M cubic feet, more than one-sixth the total for the country. This proportion is being maintained. Southwestern Pennsylvania and the adjoining parts of

West Virginia between them produce approximately one-third the total output and there are no indications of the exhaustion of the stores of this ideal fuel. The extraction of gasoline by compression provides the distributors of natural gas with a new source of revenue. Pennsylvania gas is exceptionally rich in carbo-hydrates, and one distributing company is extracting 50,000 gallons of gasoline per day. Since the discovery and development of the Lake Superior and Alabama iron mines Pennsylvania has lost its pre-eminent position as a producer of iron ore. Its output in 1921 was 189,771 tons, about .003 of the total for the United States. The value of stone quarried in this State in 1920 was \$19,067,309 (No. 1 in United States) classified as follows: Limestone, \$12,881,213 (No. 1 in United States); slate, \$2,651,533 (No. 1 in United States); and sandstone, including bluestone, \$3,534,563 (No. 2 in United States). Marble, trap-rock and granite crushed stone for ballast, concrete and road material make up the rest. The stone output of 1921 was valued at \$12,378,202. Portland cement, though in a sense an artificial product—consisting of a mixture of calciferous stone or marl and silicious earths—pulverized and calcined—can be successfully and profitably produced only in localities where minerals containing the required ingredients are found in juxtaposition and in adequate quantity. The region between Cementon, in Lehigh, and Siegfried's Bridge, in Northampton County, Pa., and Phillipsburg, N. J., is the chief centre of cement production in the United States. Nearly the whole output of the country in 1882 was produced in this region. In 1922 the output of the entire country was 114,789,984 barrels, of which number 33,276,093 barrels, or nearly one-third came from the Pennsylvania fields. The marls and other earths used in the production of cement nearly all contain potassium silicates and by slight alterations in the furnaces about 5 per cent of potash is obtained from this material in the process of calcination. Southeastern Pennsylvania produces in considerable quantities combined iron and chromium ores, hematite, magnetic iron and corundum. According to the report of the United States Geological Survey the mineral output in 1921 had a realized value of \$944,688,650.

Forest Products.—Until 1876, when the supply of white pine in this State had become nearly exhausted by the wasteful methods which marked the decade ended in 1870, the timber of Pennsylvania was accounted one of the most valuable of its natural resources. As early as 1810 there were sawed in the State 73,847,640 feet of lumber. Since 1838 Williamsport has been, as it still is, the centre of the lumber industry. Hemlock, once despised, has become the principal variety of timber now cut in this State and constitutes 73 per cent of the entire product of lumber. Hemlock is still found in considerable quantities in northern Pennsylvania, though its exhaustion would be a matter of only a short time if the measures adopted to prevent and discourage waste should fail. Oak, white pine, poplar and spruce rank next to hemlock in importance in the order named. Practically all the chestnut has been killed by the blight and the white pine is menaced by the blister rust. The State still ranks ninth in the

production of lumber, the value of its planing-mill output in 1921 having been \$56,395,093—about 3.8 per cent of the total for the United States. Of the four sawmills in the United States which produced more than 100,000,000 feet, board measure, this State contained one. Since 1901, when the Forestry Department was created and the Reservation Commission was authorized to purchase land "that the State ought to possess for forestry preservation," about 1,000,000 acres of mountain land have been acquired and made into inalienable State reservations. The protection of forests from fires caused by negligence has been the object of considerable legislation, and timber culture is being encouraged by large rebates from taxes.

Agriculture.—The soil of the State, except in the mountains, is everywhere fertile, and even where least adapted to agriculture is suitable for grazing. The southeastern part is excellent for growing cereals. The total farm acreage has not increased greatly since 1850, but the number of farms has grown over 75 per cent. The value of improved farms in the last census year (1920) was \$1,729,353,034 as compared with \$1,051,627,173 in 1900. This represented about 25 per cent of the assessed value of real property in the State. Of the 202,250 farms enumerated 153,498 were cultivated by their owners. The cereal crops raised in 1922 (a short year) were 25,444,000 bushels of wheat; 41,242,000 bushels of oats; 69,212,000 bushels of corn; 5,208,000 bushels of buckwheat (first in United States); 3,740,000 bushels of rye. There were produced also 28,512,000 bushels of potatoes, 4,888,000 tons of hay and 56,760,000 pounds of tobacco. Flour and gristmill products in 1919 were of the realized value of \$69,446,000, which gave the State seventh place in this industry. The State excels in dairy and market garden products and in the production of butter ranks sixteenth of the United States. The 1,315,803 milch cows counted in 1920 yielded 379,882,955 gallons of milk. There are generally more than 10,500,000 chickens over three months old on the farms of the State and nearly 76,000,000 dozen eggs are produced a year. There were 491,000 horses on farms in 1923; 55,000 mules and 506,000 beef cattle. The stock-raising industry remains stationary. The State department of agriculture is making efforts to prove the profitableness of raising beef and latterly the raising of sheep for wool has received encouragement from private associations and the passage of a stringent Dog Law.

Fisheries.—The most valuable fisheries of Pennsylvania are the shad fisheries of the Delaware. The Susquehanna, once famous for its shad, has been depleted by the employment of fish baskets, the building of dams and other injurious and wasteful practices. The annual catch of shad in the Delaware has recently averaged in value \$500,000; that of the Susquehanna does not exceed \$30,000 in the best years and is generally much lower. Delaware sturgeon are verging on extinction; efforts to give protection to the species by interstate legislation and by restocking the streams have not met with much success.

Manufactures.—From a very early period Pennsylvania has held the first rank as an iron producer in America. According to a publication dated 1692 a small quantity of iron had

even then been made in the colony; in 1727 it exported 274 tons of pig-iron to England and in 1756 it was spoken of as the most advanced of American colonies in regard to its iron works. Berks County was the earliest seat of the industry, where Thomas Rutter, apparently a German, erected a forge on Manatawny Creek, three miles above Pottstown, in 1716. Beginning with 1788 the industry was developed to a considerable degree in the Juniata Valley and in 1790 a blast furnace was erected in Fayette County, which remained the main source of supply of the Ohio and Mississippi valleys for many years. Not until 1859 was the manufacture of pig-iron successfully established at Pittsburgh, although that city had produced considerable quantities of steel since 1813. The tremendous growth of the industry, however, dates from 1876. Allegheny County now produces 50 per cent of the pig-iron and 65 per cent of the steel manufactured in this State. The pig-iron produced in the State in 1922 amounted to 9,732,024 gross tons, which was about one-third of the total output of the United States. This represents an increase of 50 per cent, within the limits of a decade. The annual capacity of the blast furnaces of the entire country in 1919 was 50,222,400 gross tons; the capacity of the furnaces of Pennsylvania in that year was 19,739,850 gross tons—closely approaching two-fifths of the total—and in obedience to an abnormal demand they have been recently run as nearly as possible to capacity. The production of rolled iron and steel in Pennsylvania (excluding that of the tin-plate works) was approximately 3,300,000 tons in 1890, 5,500,000 tons in 1900 and 12,143,217 tons in 1919, showing an increase of over 260 per cent in a period of 30 years. From these data some idea may be obtained of the growth of the steel and iron industry in Pennsylvania within less than a generation. The production of tin and terne plates, a new industry in 1890, was valued at \$35,283,360 in 1905. In 1919 the value of this product for the entire country was \$97,405,000, of which the State produced \$58,816,000. The foundry and machine-shop products of the State were valued in 1900 at \$127,292,440, which was nearly twice the value of the output for 1890. In 1919 their value was \$366,383,000, or nearly thrice that of 20 years previously. More than one-half the total number of locomotives built in the United States come from the shops of this State and the Delaware River at Philadelphia has become by far the greatest ship-building centre the world has ever seen. The second in importance of the industries of the State is the manufacture of textile fabrics, its output of silk, woolen, worsted and cotton goods of all kinds (clothing excluded) amounting in value in 1890 to \$134,001,269, in 1900 to \$158,782,087, and in 1919 to \$836,420,398. Pennsylvania ranks second in the production of carpets, with 33 per cent of the entire product of the country; first in the production of thrown silk and pile fabrics of that material, with 35 per cent of the total; second in the manufacture of knit goods (especially hosiery, in respect to which it stands first) with 23 per cent of the total; second in the production of woolen and worsted goods, in which it is exceeded only by Massachusetts, whose output is approximately one-third as against Pennsylvania's one-sixth,

of the total for the country. The German colonists of 1683 are credited with having introduced the manufacture of hosiery in this country; in 1810 there were manufactured in the State 107,508 pairs of stockings; in 1858 there were 700 hand frames in operation, and, indeed, the making of hosiery and other knit goods was a household industry in Germantown and vicinity down to quite recent times. The exhaustion of the hemlock forests of southeastern New York some years after the Civil War caused the tanners to turn their attention to central and northern Pennsylvania, and a great development of the leather industry followed; in 1900 the State ranked first in the tanning and finishing of leather, with products valued at \$55,615,000 or 27.3 per cent of the whole product of the country. In 1919 the State was still far in the lead in this industry, with products of the value of \$211,389,000, over 22 per cent of the product of the entire country. This State has also long led all others in the manufacture of glass, having produced 51.8 per cent of the total in 1870 and \$22,011,130 worth or 38.9 per cent of the vastly larger total in 1900. In 1919 the State's output was valued at \$80,480,000, or 30.7 per cent of the total for the country. The industry is carried on chiefly in the region of Pittsburgh, stimulated by the abundant supply of coal and natural gas, of fire-clay suitable for furnaces and the glass sand of unexcelled quality found in Fayette and Juniata counties. The first glass house west of the Alleghenies was built in 1797 by Albert Gallatin at New Geneva on the Monongahela River.

The following statistical tabulation of all manufacturing industries of Pennsylvania shows the growth thereof during a recent, though comparatively abnormal period of ten years.

	1919	1909
Persons engaged.....	1,323,662	1,002,171
Wage workers.....	1,135,837	877,543
Capital.....	\$6,177,729,968	\$2,749,006,000
Services.....	1,740,829,353	566,524,000
Salaries.....	334,763,215	110,897,000
Wages.....	1,406,066,138	455,627,000
Cost of material.....	4,218,408,628	1,582,560,000
Value of product.....	7,315,702,867	2,626,742,000
Value added by manufactures.....	3,105,294,239	1,044,182,000

The value of the product in 1914 was \$2,832,349,437.

Commerce and Navigation.—The Allegheny and the Monongahela are both navigable about 60 miles from their junction at Pittsburgh, the latter by the aid of locks and slackwater basins. The Ohio from the earliest times and down to the beginning of the railroad era was the highroad of immigration from the East to the Mississippi Valley and continues to be a busy thoroughfare of steamboat traffic. The Delaware is navigable from the sea to Trenton and has great depth along the water front of Philadelphia. The shoals in its lower course have been removed, a channel 25 feet deep at mean low water has been dredged to the sea and a further deepening of the same to 35 feet is projected. The Schuylkill is navigable for large vessels about six miles from its mouth at Girard Point, Philadelphia, and for steamboats (with the aid of dams and locks) as far as Reading. The water of the Delaware does not become brackish until some distance below Wilmington, Del.; Philadelphia, therefore, is

STEEL INDUSTRY

unique in the possession of a deep fresh water harbor within easy reach of the ocean. In 1921 the imports at the port of Philadelphia were valued at \$122,302,015 and the exports at \$130,-671,855. Most of the canals of the State have fallen into disuse, though the Lehigh and Delaware Canal carries stone, bricks, cement and coal in limited quantities. The inland waterborne commerce of the State is conducted mainly on the Delaware and Ohio rivers, while the frontage on Lake Erie gives access to the commerce of the Great Lakes. The Delaware and Raritan and the Chesapeake and Delaware canals now afford, though inadequately, interior water communication with New York, Buffalo and Boston, on the one hand, and Baltimore and the South on the other—and the improvements projected and partly carried out open up incalculable possibilities. There are 148 steam railway companies operating lines in Pennsylvania; the greater part of the carrying business is conducted, however, by 12 railways; the Baltimore and Ohio, the Buffalo, Rochester and Pittsburgh, the Central Railroad of New Jersey, the Delaware, Lackawanna and Western, the Erie, the Lake Shore and Michigan Southern, the Lehigh Valley, the New York Central, the Delaware and Hudson, the Northern Central, the Pennsylvania, the Pennsylvania Company, the Philadelphia and Reading and the Pittsburgh, Cincinnati, Chicago and Saint Louis. Of the foregoing the Northern Central, the Pennsylvania Company and the Pittsburgh, Cincinnati, Chicago and Saint Louis form part of the Pennsylvania system. The Central of New Jersey, the Delaware, Lackawanna and Western, the Erie, the Lehigh Valley and the Philadelphia and Reading carry practically all the product of the anthracite mines to market. The railway mileage of the State, according to a recent report of the Secretary of the Interior, consisted of 9,187 miles of main line and 7,931 miles of branches and spurs, a total of 17,118 miles. In 1860 the total was 2,598 miles. There were in 1922, according to the same authority, 4,870 miles of electric railways in operation within the State. Continuous or connecting lines afford means of communication northward from Chester and Philadelphia to Bethlehem, Scranton, Easton and the Water Gap, and connections can be made via Trenton to New York and the Eastern States.

Banking.—The segregation of the banks of western Pennsylvania with those of the Federal Reserve District of Cleveland has made the consideration of the national banking resources by States unprofitable. The transactions at all the clearing houses within the State for the year ended 30 Sept. 1916 amounted to \$15,895,-707,000. The combined clearings at Philadelphia, Pittsburgh and Scranton for the year ended 30 Sept. 1922 amounted to \$28,284,587,000, approximately. The transactions at Philadelphia increased from \$7,760,336,900 in 1910 to \$21,514,198,000 in 1922, about 150 per cent. The increase at Scranton and at Pittsburgh was nearly as great. Harrisburg clearings in 1922 were \$201,908,000. The annual report of the Comptroller of the Currency of date of 30 June 1922 indicates:

	Number	Aggregate assets
National banks.....	867	\$2,466,734,000
State banks.....	276	391,818,000
Trust companies.....	360	1,499,613,000

The par assets of the banks of discount and trust companies—commercial paper and call loans against collateral—amounted at that date to approximately \$500,000,000 and this capital stock and surplus to \$363,597,000. There were on the same date 2,997 building and loan associations with 1,193,372 shareholders, with aggregate receipts for which they are accountable to members to the amount of \$546,884,501.

State Finances and Government.—The revenues of the State are derived mainly from the following sources, yielding for the year 1922 approximately the following amounts:

Taxes on corporate stock.....	\$35,500,000
Taxes on net earnings of corporations.....	8,000,000
Taxes on collateral inheritances.....	5,600,000
Licenses for motor vehicles.....	12,575,400

Receipts from licenses, official fees and miscellaneous special taxes made up the rest of the State's income, which amounted to \$97,395,983. Real estate is not taxed for State purposes. The total disbursements were \$94,316,419. The State debt in 1922 was \$50,658,320. At the date of the latest available financial report there were outstanding overdue debentures, which had not been presented for redemption and on which interest has ceased to run, of the amount of \$20,505. There are \$500,000 of agricultural script bonds bearing 6 per cent. These sums are partly covered, principal and interest, by cash in the sinking funds amounting to \$6,772,537.

Pennsylvania's delegation in the Congress of the United States is composed of two Senators and 36 Representatives. The administration of the State's business and the execution of the laws is distributed between the executive department and numerous boards and commissions. The executive department consists of the governor, lieutenant-governor, secretary of state, attorney-general, auditor-general, State treasurer, secretary of internal affairs and superintendent of public instruction. The governor, lieutenant-governor, auditor-general, treasurer and secretary of internal affairs are elected; the secretary of state, attorney-general and heads of other departments and commissions are appointed. The governor, whose term is four years, and who is not eligible for re-election, is invested with the veto and pardoning power. The former may be exercised with respect to single items of appropriation bills. No pardon can be granted by the governor except on recommendation of the lieutenant-governor, secretary of state, attorney-general and secretary of internal affairs, or any three of them; these officials constituting the board of pardons. The governor may refuse a pardon notwithstanding the recommendation of the board. The general assembly consists of two branches, the senate and house of representatives, and meets biennially in the odd numbered years at Harrisburg, which since 1810 has been the capital. The senators, 50 in number, are elected for four years in such manner that the terms of one-half the number expire every second year. The house contains 208 members elected for a term of two years. The compensation to members of the general assembly is \$1,500 and 20 cents mileage for the regular biennial session and \$500, besides mileage, for any extraordinary or special session. The judiciary is composed of the Supreme Court, the Superior Court, an Intermediate Court of

Appeals and the County courts. The Supreme Court has original jurisdiction in cases of injunction when a corporation is a defendant, and the judges thereof are ex-officio justices of Oyer and Terminer; ordinarily, however, courts of Oyer and Terminer and Quarter Sessions are held by county judges, who also preside over Orphans' courts, and as judges of Common Pleas have jurisdiction in the first instance over all civil actions.

Population.—Pennsylvania has (United States Census Bureau returns, 1920) a population of 8,720,017. The growth of population by decennial periods is indicated below:

1790.....	434,373	1860.....	2,906,215
1800.....	602,265	1870.....	3,521,951
1810.....	810,091	1880.....	4,282,891
1820.....	1,049,458	1890.....	5,258,014
1830.....	1,348,233	1900.....	6,302,115
1840.....	1,724,033	1910.....	7,665,111
1850.....	2,311,786	1920.....	8,720,017

Of the 1920 population 284,568 were negroes and 2,732 were of Indian, Mongolian and other non-European races. The native-born whites numbered 7,044,876, of whom approximately 90 per cent were born in the State. There were 4,750,071 of native parentage, 2,294,805 of foreign or mixed (foreign and native) parentage, and 1,387,850 foreign born. The rural population was 35.7 per cent of the total, which compares with 21.6 per cent for New Jersey, 17.3 per cent for New York. Of the total population 4,429,020 were males and 4,290,997 females. There were 2,452,768 women in the State 21 years of age and over in 1920. The males 21 years of age and over numbered 2,586,323, of whom 727,190 were foreign-born whites, and 103,137 were negroes. Foreign-born white females 21 years and over numbered 546,843 and female negroes 21 years and over numbered 88,089. The total vote cast in the State in the presidential election of 1920 was 1,849,692. The density of the population of Pennsylvania in 1920 was 194.5 to the square mile. The figures above given can, generally speaking, be brought down to date by increasing them 2 per cent for each elapsed year, which is the method adopted by the Census Bureau in making its estimates.

The number of persons in Pennsylvania who were engaged in manufacturing industries in the last three census years is shown below:

YEAR	Total number	Males	Females	Per cent male	Per cent female
1919...	1,323,662	1,060,165	263,497	80.1	19.9
1914...	1,060,562	844,300	216,262	79.6	20.4
1909...	1,002,171	802,548	199,623	80.1	19.9

Political Divisions.—The State is divided into 67 counties. The present constitution forbids special legislation, but the Act of 25 June 1895 divides cities into three classes and, under the guise of general laws for each class, Philadelphia is legislated for by itself, being the only municipality answering the description of a city of the first class. The second class of cities includes those containing a population of 100,000 and less than 1,000,000 and covers Pittsburgh, Reading and Scranton. Cities of less than 100,000 population constitute the third

class. The commission form of government has been made mandatory in this class by a general act. The principal cities of the third class with their population in 1920 follow:

Allentown.....	73,502	Hazleton.....	32,277
Altoona.....	60,331	Johnstown.....	67,327
Beaver Falls.....	12,802	Lancaster.....	53,150
Bethlehem.....	50,358	Lebanon.....	24,643
Bradford.....	15,525	Lock Haven.....	8,557
Butler.....	23,778	McKeesport.....	46,781
Carbondale.....	18,640	Meadeville.....	14,568
Chester.....	58,030	Monongahela.....	8,688
Coatesville.....	14,515	New Castle.....	44,938
Connellsville.....	13,804	Oil City.....	21,274
Corry.....	7,228	Pittston.....	18,497
Du Bois.....	13,681	Pottsville.....	21,876
Duquesne.....	19,011	Titusville.....	8,432
Easton.....	33,813	Uniontown.....	15,692
Eric.....	93,372	Wilkes-Barre.....	73,833
Franklin.....	9,970	Williamsport.....	36,198
Harrisburg.....	75,917	York.....	47,512

The principal boroughs of Pennsylvania, some of which are more populous and otherwise more important than many of the incorporated cities, are given below, with counties where located and population at the last census:

Braddock (see North Braddock), Allegheny.....	20,879
Bristol, Bucks.....	10,273
Carlisle, Cumberland.....	10,916
Carnegie, Allegheny.....	11,516
Chambersburg, Franklin.....	13,171
Columbia, Lancaster.....	10,833
Conshohocken, Montgomery.....	8,481
Darby, Delaware.....	7,922
Dunmore, Lackawanna.....	20,250
Farrell (South Sharon), Mercer.....	15,586
Greensburg, Westmoreland.....	15,033
Homestead, Allegheny.....	20,452
Mahoning City, Schuylkill.....	15,599
Monessen, Westmoreland.....	18,179
Mount Carmel, Northumberland.....	17,469
Nanticoke, Luzerne.....	22,614
Norristown, Montgomery.....	32,319
North Braddock, Allegheny.....	14,928
Old Forge, Lackawanna.....	12,237
Phoenixville, Chester.....	10,484
Plymouth, Luzerne.....	16,500
Pottstown, Montgomery.....	17,431
Punxsutawney, Jefferson.....	10,311
Shamokin, Northumberland.....	21,204
Sharon, (see Farrell), Mercer.....	21,747
Shenandoah, Schuylkill.....	24,726
Steelton, Dauphin.....	13,428
Sunbury, Northumberland.....	15,721
Warren, Warren.....	14,272
Washington, Washington.....	21,480
West Chester, Chester.....	11,717

Charities and Correction.—Provision is made for the care of the criminal, indigent, insane and other defective and dependent persons in numerous State institutions, under the general supervision of the board of public charities. The correctional institutions, aside from the county jails, are the Eastern and Western penitentiaries, the former at Philadelphia and the latter at Pittsburgh; the State Industrial Reformatory at Huntingdon and the Reform School at Morganza. The Philadelphia House of Refuge, the male department whereof is at Glen Mills, Delaware County, though a local institution, receives State aid and accepts commitments from all counties. The contract system was abolished by law in 1881, and the inmates of prisons and reformatories are required to be employed "in behalf of the State" or "in behalf of such institutions." The penitentiaries are supported in part by appropriations from the State treasury. The other needed revenues are derived from the labor of convicts, profits of manufacturing, payments by the United States for the support

of Federal prisoners and by the counties to make good any deficiency of support by labor of their convicts. The convict inmates of all correctional institutions, workhouses, county jails, the Industrial Reformatory, the Eastern and the Western penitentiary, at the date of the latest officially published reports were 9,923. The House of Refuge at Glen Mills had 1,186 and the Reform School at Morganza 500 inmates. The population of the almshouses was 17,802. The State hospitals for the insane, five in number, and located at Harrisburg, Danville, Norristown, Warren and Dixmont; the State asylum for chronic insane at Wernersville; the Homeopathic State Hospital at Rittersville and the State Hospital for the Criminal Insane at Fairview at the date of the latest published official report held 10,876 patients. The county-care hospitals held 7,919 insane patients; there were 832 in private hospitals and sanatoria and about 150 in almshouses and jails. The number of insane persons cared for in these various institutions was 19,800, of whom 10,530 were males and 9,270 females. Institutions for the feeble-minded at Polk, Spring City and Elwyn care for 3,435 defectives; four institutions for the deaf and dumb give instruction in oral speech and other training to 970; there are 336 inmates of institutions for the blind, 19,145 in home for children and the aged and friendless, 10,910 in State and private hospitals and 525 in sanatoria. The total population of the correctional and charitable institutions of Pennsylvania at date of the latest official report was 64,732. It is the policy of the State to give liberal aid to private charities and the money grants considerably exceed \$2,000,000 a year. The unsystematic, haphazard manner in which the appropriations are distributed and the multiplication of applicants for State bounty lay open the present method to just criticism. There remain to be mentioned as State institutions the five hospitals for injured miners—one in the anthracite region, one in the middle field and three in the bituminous coal fields—and, finally, the Soldiers' and Sailors' Home at Erie.

Education.—The system of public instruction of the State dates from 1834, when the Common School Law was passed. The system is under the direction of the State superintendent. There are 2,582 school districts, each district generally comprising a township. The directors of the district assess the local rates. The supervision of instruction is by county superintendents and their assistants. The more important of the third-class cities have their own superintendents and the great cities have autonomous systems under local boards of education. The total number of public schools in the States is 40,655. Of these 331 are first-grade high schools, 275 second-grade high schools and 368 are third-grade high schools. There are 66 county superintendents, 79 assistant county superintendents and 123 district superintendents. There are 42,727 teachers, 9,163 males with salaries averaging \$68.63 per month, and 33,564 females, whose monthly stipends average \$50.55. The whole number of pupils for the school year ended July 1922, was 1,624,915. Attendance at school between the ages of 6 and 14 years is compulsory. The constitution of 1873 requires the general assembly to appropriate not less than \$1,000,000 a

year to the common schools; the sum regularly appropriated is over \$7,000,000, besides \$300,000 for free tuition of students at the State Normal School and \$250,000 for other purposes. The total expenditure for the entire system in 1921 was \$111,459,798. Manual and vocational training have become features of prime importance in public instruction in Pennsylvania. Boys and girls between the ages of 14 and 16 who leave school to go to work are required to attend school not less than eight hours a week. For these, continuation classes are provided, which are located when feasible at the industrial plants where the pupils are employed. More than 30,000 pupils attend private schools and academies; there are more than 3,000 on the average in attendance in manual training and trade schools; more than 7,000 attend business colleges and more than 5,000 receive instruction at collegiate and other institutions for orphans. There are in the State 16 theological seminaries, seven medical colleges, four colleges of pharmacy, five dental colleges and four law schools. The Pennsylvania State College is one of the "land grant" colleges founded under the act of Congress of 1862. The names of the private collegiate institutions in the State, with their religious denominations, if any, are given in the following table:

NAME OF INSTITUTION	Denomination
Allegheny College, co-ed.	Methodist-Episcopal.
Bryn Mawr, female.	
Bucknell University, co-ed.	Baptist.
Dickinson College, co-ed.	Methodist-Episcopal.
Franklin and Marshall College.	Reformed Ch. in U. S.
Geneva College, co-ed.	Reformed Pres.
Grove City College, co-ed.	
Haverford College.	Friends.
Lafayette College.	Presbyterian.
Lebanon Valley College, co-ed.	United Brethren.
Lehigh University.	
Moravian College and Theological Seminary.	Moravian.
Muhlenberg College.	Lutheran.
Pennsylvania College, co-ed.	Lutheran.
Pennsylvania Military College.	
Saint Vincent College and Seminary.	Roman Catholic.
Susquehanna University, co-ed.	Lutheran.
Swarthmore College, co-ed.	Friends.
Thiel College, co-ed.	Evangelical-Lutheran.
University of Pennsylvania, co-ed.	
Ursinus College, co-ed.	Reformed Church.
Villanova College.	Roman Catholic.
Washington and Jefferson College.	Presbyterian.
Waynesburg College, co-ed.	Cumberland Pres.
Western University of Pennsylvania, co-ed.	
Westminster College, co-ed.	United Presbyterian.
Wilson Female College.	Presbyterian.

Newspapers and Other Publications.—In 1900 there were in Pennsylvania 1,795 establishments engaged in printing and publishing with 16,991 wage-earners and products valued at \$36,455,629. In 1919 the number of establishments was 2,457, the wage-earners employed numbered 26,456, and the products had increased in value to \$165,344,000. The first printing press in the State was erected at Philadelphia in 1686, the first paper mill in the United States was established at Germantown in 1693. Franklin in 1787 stated that he was interested in the establishment of 18 and that there were then in operation 48 such mills in the State. In the middle of the 18th century there were some lively political wars of words carried on in the province and pamphlets were as numerous here as sermons in New England. In 1810 it was estimated that half a million volumes were printed annually at Philadelphia

and for half a century after the Revolution as it had been for half a century before, this city was undoubtedly first in the printing industry. The first daily paper in the United States was established here in 1784. By 1810 the number of newspapers had increased to 73, of which eight were dailies—a larger number than published in any other city of the country at that time. The output of the periodical press in 1919 was valued at more than \$106,667,000 (17th rank in State) and the aggregate circulation per issue of all (1,204) publications, according to the most recent information obtainable, was 20,364,679 copies, classified as follows:

PUBLICATIONS	Number	Aggregate circulation per issue
Daily.....	201	3,047,247
Sunday.....	29	1,612,115
Weekly.....	653	6,154,412
Monthly.....	191	6,001,752

Semi-and tri-weekly.....	23	3,549,153
All others.....	62	

HISTORY.

The Swedes Colony.—The earliest settlements of white men on the western shore of the Delaware River were those of the Swedes. Though Henry Hudson, in the service of the Dutch East India Company, had turned the prow of the *Half Moon* into Delaware Bay in 1609; though Cornelius May, a Dutch navigator, in 1616 explored the bay and river, giving his own name to one and the name of a Frisian town (Hindlopen) to the other of the outer capes; though the Dutch West India Company in 1623 formally took possession of South River, now the Delaware, built Fort Nassau on the present site of Gloucester, N. J., and later on, Fort Beversrede on the Schuylkill—the Dutch came merely as traders. The Swedes were real colonists, Gustavus Adolphus, the Swedish champion of Protestantism in Germany, is believed to have entertained a rather large scheme of colonization in America; but the king's preoccupation by his contest with the German emperor hindered the development of the plan, and his death at Lützen ended it. In a more modest form the project was taken up by Chancellor Oxenstierna and in December 1637 two small vessels filled with Swedes and Finns set sail for America. The expedition was led by Peter Minuit, who had been director-general in the plantation of New Amsterdam. Heedless of the protests of either the English in Virginia or the Dutch in New Netherlands, the doughty Peter proceeded to build a fort on the present site of Wilmington and buy from the Indians all the west shore of the South River from Bombay Hook to the Schuylkill. He was drowned in the West Indies in the following year and was succeeded by one Hollander, who brought another ship load of colonists and enlarged the boundaries by purchasing the west bank up to Trenton Falls. In 1642 came John Printz, with two war-ships and an armed transport and fortified with a commission to administer justice, maintain the Lutheran religion and defend New Sweden against all comers. Printz, who was a native of Holstein, appears to have been a person of distinction. He had been a lieutenant-colonel in the Swedish service and lived to become a

general. He was accompanied by 54 German families, mainly from Pommerania. He strengthened Fort Christina (Wilmington) and established another, armed with cannon, on Tinicum Island; where he also erected for himself a mansion and pleasure house and built a yacht. The settlers cultivated tobacco, wheat, rye and barley; they raised cattle and had a flourishing mill on Cobb's Creek. Fort Casimer, which Peter Stuyvesant had established in the locality where New Castle, Del., now stands (in order to overawe the Swedes), was captured by Printz and enlarged. At last, in 1655, while Governor Printz was absent from the colony, the Dutch sent an overwhelming force of 750 men down from New Amsterdam and the Swedes capitulated. The colony henceforward shared the vicissitudes of New Netherlands; it was captured by the British in 1664, recaptured by the Dutch 10 years later, and finally ceded to Great Britain by the treaty of peace signed February 1675, when it was annexed to the domains of the Duke of York in America. The colony included about 200 families and, a few years before the arrival of Penn, received some accessions from the English Quakers who had begun to settle in West Jersey in 1675. "The Three Lower Counties on the Delaware" were transferred to William Penn by the Duke of York in 1681 and were attached to Pennsylvania until 1701, when Penn consented to a separate assembly for the "Territory," by which name the counties became known. The social and political relations between "Territory" and "Province," however, continued most intimate, even after the separation; it was not unusual for the residents of one colony to sit in the legislature of and to occupy high official positions in the other down to Revolutionary times, when the "Territory" became the State of Delaware.

Penn's Experiment in Government.—

"This day my country was confirmed to me under the great seal of England, by the name of Pennsylvania," wrote Penn, in a letter of date 5 March 1681 (the charter bears date March 11th). He had proposed to name it New Wales, "being as this a pretty, hilly country"; and when this was objected to, he suggested Sylvania. "They added Penn to it," he continued, "and though I much opposed it and went to the King to have it struck out, he said it was past, and would take it upon him; nor could twenty guineas move the under Secretary to vary the name; for I feared lest it should be looked on as a vanity in me and not as respect in the king, as it truly was, to my father." The charter, which was granted partly in extinguishment of a debt due from the King (Charles II) to Admiral Penn, the father of the first proprietor, conveyed a tract lying between the 40th and 43d parallels of north latitude and extending from the Delaware River westward five degrees of longitude. Beside making Penn the sole and absolute proprietor of the land it invested him with power to frame the laws, subject to the consent of the freemen, to appoint judges and other officers, impose taxes, suppress piracy and levy troops. To the British Parliament was reserved the right to lay imposts and to the Privy Council Committee on Trade and Plantations the right to annual provincial laws, which were

required to be submitted to that body within five years after enactment. The Proprietor thus had an absolutely free hand for half a decade, at least, to conduct his "holy experiment." To the men of the tail end of the 17th century, still in the throes of a sanguinary religious conflict which had devastated Europe for more than 150 years, the idea of founding a state without an established church, and wherein all creeds were to be placed on a footing of complete equality, must have appeared as hare-brained as do the tenets of scientific nihilism to the average citizen of our times. The notion of establishing in a howling wilderness an unarmed community, conscientiously obedient to the doctrine of non-resistance, must have seemed a manifestation of insanity. What could be expected of such a community but that it would be annihilated by its savage neighbors or be wrecked by internal anarchy? But, nothing daunted, Penn proceeded with framing a constitution for his colony. His magnetic personality had enabled him to smooth out differences and preserve harmony in the intensely individualistic sect to which he belonged and he doubtless, imagined he could sway a Quaker assembly with like success. His expectations to permanently reside in and to personally superintend the upbuilding of his model State were doomed to be disappointed, however. He arrived at New Castle in the ship *Welcome* on 27 Oct. 1682, and in less than two years he was called back to England by the state of the controversy over the Maryland boundary. Political and financial complications detained him there until 1699. His departure was the signal for the outbreak of dissensions. Penn's first "Frame of Government" was a compound of feudal, monarchical, aristocratic and democratic elements. The proprietor was the lord paramount of the soil and all the colonists were his tenants; he claimed the right not only to appoint the judges, but of organizing the courts; the assembly had the power to assent or to reject proposed laws, but the initiative in legislation as well as supreme judicial and administrative authority was vested in the council, which was thus a copy in miniature of the British House of Lords and Privy Council rolled into one. The assembly chafed under the restrictions placed upon its action. It could not inaugurate but it could frustrate legislation. It impeached its speaker for no apparent reason than that he was more reasonable than "the witless zealots" who made "a monkey-house of Mr. Penn's Assembly"—the quotations are from a letter of Penn's deputy, Governor Blackwell. A clerical adventurer named Keith about this time was threatening to cause a schism in the Quaker brotherhood and the colony resounded with shrill invectives from the orthodox—for Keith, though a man of no principles, was eloquent and had no equal in this respect in the province. Penn's friend, James II, the former Duke of York, had been deposed and William of Orange had succeeded to the throne. William well understood for what purpose his enemy Louis XIV had sent Frontenac back to Canada in 1691 invested with vice-regal powers; he determined to put the colonies in a condition to effectively defend themselves. Colonel Blackwell, an old Cromwellian soldier, whom Penn had appointed his deputy, perhaps with such a contingency in

view, was unable to extract a penny of money from the assembly for military purposes. Two commissioners sent to Pennsylvania from New York at King William's command reported that the colony was prepared neither against an Indian attack from the west nor against the French privateers who infested the estuary of the Delaware. To the foremost warrior of that warlike age this seemed a trifling with fate. The Proprietary charter was revoked in 1692 and Governor Fletcher of New York instructed to take over the direction of affairs in Pennsylvania. On giving his promise to the Privy Council to "provide for the safety and security" of the colony, to transmit to the assembly the king's orders, and on expressing his assurance that the colony would "supply such quotas of men and defray such part of the charges as his majesty might deem necessary to preserve his dominions in North America," Penn was re-instated in his proprietorship in 1694. During his second brief term of residence in the colony, from 1699 to 1701, Penn urged and secured the passage of laws to suppress piracy and contraband trade, a subtle distinction between police and military measures enabling him to reconcile his conscience to these enactments. He could not, however, prevail over himself to advocate the warlike policy imposed upon him by royal command; and his promise remained unfulfilled. A second, and probably final, revocation of his charter being impending Penn hurried back to England, as the event proved, never to return. By the sudden death of King William the charter was saved; but the assembly had been made to dimly comprehend that it represented a polity and not a denomination and, on the renewal of war with France in Queen Anne's time, voted money to the use of her gracious majesty—to be sure, with an artless effort to conceal the purpose for which it was granted. Less consideration was shown for the founder. "O, Pennsylvania, what hast thou cost me?" wrote Penn in 1705. "About £30,000 more than I ever got, two hazardous and fatiguing voyages and my son's soul." The reference is to William Penn, Jr., a scapegrace, whose escapades had scandalized sober Philadelphia and who died shortly after a brief and boisterous career as member of the Pennsylvania council. Though pecuniary profit was the last thing considered by Penn, it certainly was not an unreasonable expectation that the colony would afford him an income commensurate with the sacrifices he had made. He had expended over £50,000, the greater part of his patrimony, in establishing the same. The quit-rent demanded for land was low, but the payments were spasmodic; the receivers were derided and occasionally maltreated. The sales of land up to 1710 amounted to 91,000 acres, bringing a total of £10,640. But the assembly exhibited supreme indifference to Penn in his financial distress. When reminded by the proprietor that he had received no support from the colony for 20 years an excise tax was ordered in 1700 for his benefit; but in the following year the income therefrom was directed to be paid into the public treasury. Disillusioned, and harassed by the fear that he would leave his family ruined, Penn entered into negotiations with the Crown to surrender his proprietary rights. A stroke of paralysis prevented the consummation of the agreement.

A Quaker Republic.—But the experiment in Quaker government was not wholly a failure. The last act of Penn before leaving the colony in 1701 was the promulgation of a new constitution. The assembly became the sole law-making power, the council an appointive advisory and executive body; the proprietor resumed the right of veto, which he had in the beginning and of his own free will renounced. David Lloyd, a Welsh Quaker, the best lawyer in the province, assumed the leadership of the popular party. He was an unscrupulous politician, a lover of power and a persistent personal enemy of William Penn; but in him the assembly found its master. Whatever else may be said to the discredit of David Lloyd it cannot be denied that he was an uncompromising democrat and made the assembly a workable political machine. Governor Evans (1704-09) spoke truly when he said that "the proceedings of the Assembly from the beginning of the century indicated a purpose to reverse the methods of government according to the English Constitution and to establish one more nearly resembling a republic in its stead." When the House assumed the right to prorogue itself at will it became practically the most independent legislative body in the British Empire. Although the veto of the proprietor or his deputy governor was absolute, the assembly, holding the purse-strings of the province, was in the end able to get anything it seriously desired. As for the right of the Privy Council or their lordships of the Board of Trade to annul provincial laws, the assembly could, if it would, re-enact them; when they would stand good until again repealed—and this expedient the House did not hesitate to employ on occasions. After a struggle of nearly a quarter century between the assembly on the one side and the proprietaries and the British Privy Council on the other, over the organization of the colonial judiciary, the courts were finally organized (in 1722) substantially as first proposed by the House. The county courts, or courts of common pleas, were made the main depositories of judicial power; all cases, civil and criminal, were triable in the first instance by tribunals of the vicinity in which the cause of action arose. No provincial imitation of the English King's Bench could send forth a Jeffreys to hold bloody assizes, the local courts were not to be dominated by certiorari, mandamus and quo warranto, and their proceedings were reviewable, generally speaking, only on appeal of one of the parties to an action. To this day the judiciary system of Pennsylvania retains practically the organization thus provided under Lloyd's influence. The attempt to undermine the Quaker democracy by requiring all public functionaries to take oaths of office, and by compelling jurors and witnesses in judicial proceedings to be sworn, ended in failure, although the victory in this case involved a sacrifice of Penn's mild penal code. The scruples of the Quaker juries, however, continued to give assurance against the taking of human life as a penalty for petty crimes. "It is our great happiness," said Andrew Hamilton, speaker of the assembly in 1739, "that instead of triennial assemblies, a privilege which several other colonies have in vain endeavored to obtain, ours are annual and for that reason less

liable to be practised upon or corrupted. We sit upon our own adjournments when we please and as long as we think necessary and are not to be sent a-packing in the middle of a debate and disabled from representing our just grievances to our gracious sovereign. . . . We have no officers but what are necessary . . . and those generally elected by the people or appointed by their representatives. Other colonies swarm with unnecessary officers nominated by the governors, who make it a main part of their care to support them notwithstanding their oppressions. . . . Our foreign trade and shipping are free from all imposts except those small duties payable by the law of Great Britain. The taxes we pay for carrying on the public service are inconsiderable, for the sole power of raising and *disposing* money is lodged in the Assembly, who appoint their own treasurer and to them alone is he accountable. Such is our happy state as to civil rights." In the constitution of 1701, as in all the previous "Frames of Government," Penn had given the foremost place to the proviso for the unconditional equality of all religious creeds. The proviso was esteemed rather lightly by the assembly; they had "liberty enough for Englishmen," and some would have preferred to disqualify all but Quakers. Even Penn's secretary, Thomas Logan, wrote to him that "most of us do not value it at so many pence." Penn was ahead of his times, but liberty of conscience was doubtless one of his most beneficent legacies to the colony. Another, of the utmost advantage, was his Indian policy. Firmly convinced that the natives could be won by justice, he would permit no land to be opened to settlement without consent of the aboriginal occupants. In several instances the claims of five or six tribes asserting title to territory acquired by the proprietary from one of them were successively satisfied. The famous Treaty of Shackamaxon, however, involved more than a mere land purchase. In Penn's description of Pennsylvania he says: "We have agreed that in all differences between us, six of each side shall end the matter"; and from this and the Indian traditions it may be inferred that the compact was an arbitration treaty. Governor Byrd of Virginia, who certainly could be suspected of no predilections in favor of Quakers, in 1734 put his testimony on this subject in writing thus: "The truth is they have observed exact Justice with all the natives bordering on them . . . which has saved them from many wars and massacres, wherein the other colonies have been indiscreetly involved." In this manner Penn and the Quakers contributed much to the security of the American frontier; as for Pennsylvania, down to Braddock's defeat, "she scarcely knew an alarm." Peace, abundance and religious and civil liberty, were blessings which few if any other communities of that era enjoyed. Small wonder that the colony grew with unparalleled rapidity; it would have been strange if it had not. Within 20 years of the first settlement the province contained nearly 25,000 white settlers, besides 6,000 Indians and nearly as many negroes. By 1750 its capital city was the market centre for a population of probably 150,000. In 1723 about 85 vessels entered the port; its imports amounted in value to £16,000 and its exports to £90,000. By 1752 the

ships annually visiting the port numbered 453, and its foreign trade had grown in value to £320,000.

German and Other Foreign Accessions.—From the first the Quaker community received non-English accessions. A company of Friends of Welsh nationality bought large tracts of land west of the Schuylkill. Such names as Merion, Bryn Mawr, Radnor and Cynwyd still proclaim the Welsh origin of these townships. The sale of land within their "Barony" to others than Welshmen evoked protests from these particularists and their "meetings" performed nearly all the functions of government, even ordering such matters as the establishment of ferries and the erection of line fences. But the purpose, if it ever existed, of maintaining a Welsh imperialism in imperio was not long sustained. Their leading men soon took active parts in the political life of the province. The same vessel which brought over the Welsh in 1683 carried Francis Daniel Pastorius, the founder of Germantown and a signer, perhaps the originator, of the first American petition for the abolition of slavery. Pastorius and his company were German Quakers. The Mennonites had been hounded up and down the country from Lake Geneva to the North Sea for a century, when, falling in with Penn's missionaries and encouraged by letters from Pastorius, a party of them, headed by William Rittinghuysen, set out for Pennsylvania in 1688, joined the Germantown colony and were followed in time by nearly the whole body of the sect. To the Dunkers, who came to Germantown in 1719, belonged Christopher Sauer, the printer of the first Bible in America in a European language. The Moravians, adherents of the pre-Lutheran reformer John Huss, had become almost annihilated in the religious wars of the 17th century. A remnant of the sect was given asylum on the estate of Count Zinzendorf in Silesia. This refuge was called Herrenhut (Shelter of the Lord), an almost literal translation into German of the name Bethlehem. Their noble protector found the means of transporting the Moravians to America. Georgia, their first stopping place, was abandoned for the more congenial surroundings of Pennsylvania; and here they were joined by Count Zinzendorf in 1734, who publicly renounced his title of nobility and led his little band to a new Bethlehem on the Lehigh. The Moravians, who were men of deep learning and refined manners, attained considerable success in their effort to civilize their Indian neighbors and to instil into their more backward kinsmen higher ideals of living.

All told the Germans in Pennsylvania in 1710 did not exceed 3,000 in number. Beginning with that year a tide of immigration set in which was to impress upon a large section of the Commonwealth characteristics that have persisted to the present day. The Palatines, as they have been called without sufficient regard for historical accuracy, were not the victims of religious bigotry; they belonged to regularly established churches, the Reformed and the Lutheran—wherefore they were called "church people" to distinguish them from the "Sects." The cause of their emigration *en masse* is obscure. The devastation of their homes during a century of conflict, first, in the Thirty Years' War, by Swedes and Imperialists, and later by the armies of Louis XIV

and his German, English and Dutch foes who made their country a common battleground; the hard winter of 1708-09 and inducements believed to have been held forth by the government of Queen Anne—all these probably contributed to the result. In 1709 from 12,000 to 15,000 of these wretched and half-famished people were gathered in London, sustained by public and private charity. Many died, a few returned to Germany, others were scattered to various parts of England; about 3,000 became settled in Ireland and a nearly equal number were given passage to America. The uncouth and destitute wanderers were looked upon with disfavor by the authorities at Philadelphia; they did not long trouble the latter with their presence, however, but pressing beyond the tracts occupied by the Quakers they took up lands mostly in Berks and Lancaster counties and in the Lebanon and Lehigh valleys, where their skill in husbandry soon made them fairly prosperous and contented. The German immigration into Pennsylvania exceeded in number all others in colonial times; in the year 1749 alone 12,000 landed at Philadelphia. "I remember," wrote Franklin in 1753, "when they modestly declined intermeddling in our elections, but now they come in droves and carry all before them. Of the six printing houses in the province two are entirely German, two half German half English and but two entirely English. They have one German newspaper and one half-German. Advertisements intended to be general are now printed in Dutch and English. The signs in our streets have inscriptions in both languages and in some places only German. They begin of late to make all their bonds and other legal instruments in their own language, which are allowed good by our courts. . . . and I suppose in a few years interpreters will be needed in the Assembly to tell the one half of our legislators what the other half say." At the outbreak of the Revolution the population of the State was about 300,000, and Franklin's remark that it consisted one-third of Quakers, one-third of Germans and one-third of miscellaneous and refractory elements was substantially correct. By this time the Swedes and Welsh had been merged with the English-speaking population; but the so-called Palatines constituted a seemingly impermeable mass. In the Revolutionary period they, conjointly with the Scotch-Irish Presbyterians, dominated the government. During the first quarter of the 19th century, and even later, the Germans held the balance of power in Pennsylvania politics, a fact to which the succession of early State governors with German names bears witness. Even at the present day many of the inhabitants of the German belt can speak no other tongue than "Pennsylvania Dutch"; and in a recent sensational criminal trial, when some of the witnesses were unable to give their testimony in any other language, neither judge nor jury nor the prosecutor nor counsel for defense required the services of an interpreter.

The Era of Franklin.—The sons of Penn by his second marriage were in almost every respect the opposites of their father. They had abjured Quakerism and entered the Church of England; they possessed none of his intellectual gifts and were parsimonious and grasping. Thomas Penn, who succeeded to the proprietor-

ship by right of primogeniture, inaugurated his career by cheating the friendly Delawares. The latter had ceded a tract of land to the west of the Delaware River, extending from the latitude of Trenton northward as far as a man could walk in a day and a half; the new proprietor caused the distance to be measured off in a 36-hour relay race by two trained athletes. This transaction became known in history as the "Walking Purchase." The quarrel was further embittered when the Delawares, who had threatened to defend their homes, were ordered off the land by their suzerains—the Six Nations of the Iroquois Confederacy—to whom the proprietors appealed. The colony now for the first time had a vindictive and savage foe on its frontier. Pennsylvania was but little affected by the third of the wars between France and Great Britain, in which the American colonies were more or less involved and which broke out in 1744. There was some apprehension from privateers in Philadelphia, and Franklin's appeal in his pamphlet, 'Plain Truths,' roused the people who were not Quakers to organize a volunteer force and to build and equip a fort on the river just below the city; there was some desultory fighting in the Indian borderland; Thomas Penn's deputy proclaimed the Delawares and Shawnees public enemies and magnanimously offered rewards for Indian scalps. The intelligence of the New England militia's expedition to Louisburg seemed like news from another continent. The assembly remained unmoved by Franklin's terrible description of a defenseless community, "subject to the wanton and unbridled rage, rapine and lust of negroes, mulattoes and others, the vilest of mankind," such as constituted the crews of privateering vessels in those times. Many Quakers resigned their seats, however, and surrendered other official positions, being unwilling to serve under a government which had committed the sin of declaring war. The peace of 1748 endured only for a short time. The decisive conflict between France and England for colonial empire in America was drawing near. The Seven Years' War, in which Frederick of Prussia earned his title of "the Great," and in which England under Pitt gained Canada and India, began in Europe in 1755; in America the gravity of the situation was recognized two years earlier. At the Congress of Albany in 1754 the Pennsylvania assembly was represented by Samuel Norris and Benjamin Franklin; the proprietary by John Penn. One of the main objects of the Congress was to deter the Six Nations, hitherto the strongest bulwark against the savage allies of France, from casting their lot with the enemies of the English settlers. That at such a time, when the American colonies were preparing to defend their very existence, the proprietors should have imperiled all for private gain seems incredible, but such was the fact. In the "Western Purchase," which was consummated at the Albany conference, the Indians were deceived into conceding their favorite and jealously guarded hunting grounds, the boundaries being described by the compass, which they did not understand. Part of the Iroquois openly espoused the French cause; the remainder became lukewarm and unreliable friends. The disaster of Braddock threw the undefended colony open to the murderous onset

of its now numerous native enemies. In the fall of 1755 the savages, after overrunning the outlying settlements, pressed through the passes of the Blue Mountains on the heels of the fleeing British regulars. Every post brought to the council at Philadelphia heartrending appeals for help; the assembly and the governor, acting under instructions from the proprietary, were deadlocked; no money bills could be passed. Troops of frontiersmen rode through the city threateningly brandishing their weapons; a party of Germans laid the corpses of their countrymen, scalped within 65 miles of the capital, at the door of the State House. The Quaker peace policy was denounced in unmeasured terms from the backwoods pulpits. On this occasion, however, the assembly did what it could. It had voted money to aid Massachusetts in the expedition to Cape Breton and, the grant having been vetoed, it had adopted the suggestion of Franklin to draw upon the Loan Office, as it had a right to do without the consent of the executive. There was not a stiver in the treasury of that institution, but an issue of interest-bearing bills of credit payable in a year served the purpose. The assembly was prepared to levy a tax to provide for the defense of the province, but the governor's instructions from the proprietary were to sign no supply bills unless the estates of the latter should be expressly exempted from taxation. "He who would purchase present security at the cost of essential liberty," insisted Franklin on the other side, "deserved neither security nor liberty"; and so the deadlock continued until late in the fall of 1755. Intimidated at last by the indignation aroused in England by the reports of their meanness, the proprietors agreed to "donate" £5,000, approximately their share of the proposed levy. Under the pressure of necessity the assembly yielded the point, voted the money and left the proprietary estates untaxed. A volunteer regiment was speedily recruited by Franklin, who proceeded to the frontier with part of his force to supervise the construction of a line of forts. Blackened ruins everywhere told their fearful tale. The savages had not even spared their own kin; Gnadenhut, a settlement of Indians who had been civilized and Christianized by the Moravians, had been wiped out. The Moravians, themselves, though relieved from military service by special act of Parliament, were found by Franklin to be "in good posture for defense." The trouble subsided gradually during 1756; the voluntary organization of the Scotch-Irish frontiersmen into companies of rangers had a good effect; the destruction of Kittanning in January 1757 by the Pennsylvania levies compelled the hostile Indians to retire behind the guns of Fort Du Quesne. A treaty of amity was concluded later in the year with the Delawares and Iroquois at Easton, and the Ohio Indians were persuaded by Moravian missionaries to give up the war. The French dismantled and abandoned their stronghold; when rebuilt it became Fort Pitt. So far as Pennsylvania was concerned the conflict was ended. There was to be a tragic epilogue to the French wars, however. Peace had scarcely been concluded between France and Great Britain in 1762 when the American frontier was again ablaze and the scalping parties of Pontiac ravaged all Pennsylvania west of

the Susquehanna. Eight fortified outposts fell in a single day, though Fort Pitt was saved by Colonel Bouquet, who proved a better soldier than Braddock. Maddened by fear and by their sufferings a body of Scotch-Irish rangers, the "Paxton Boys," so named for the principal settlement of their vicinity, fell upon the remnant of the Conestoga tribe—some 20 harmless people, who eked out a miserable existence by weaving baskets and binding brooms. Every man, woman and child of them was butchered. The expressions of horror in Philadelphia over the deed of blood evoked recrimination from the backwoods; treating with the heathen instead of exterminating them was pronounced ungodly, and the calamities which had come upon the province were declared to have been visitations in punishment of a sinful and irreligious policy. Here was a contrast, indeed, with the Quaker point of view. When the Moravian Indians, for better security, had been removed to Philadelphia the "Paxton Boys," swollen by rumor to an army, swooped down on the city, vowing to annihilate the red-skinned Ishmaelites as well as anybody who dared defend them. In the excitement several hundred young Quakers joined the defenders, musket in hand. The affair fizzled out. It was Franklin again who relieved the situation. He interviewed the rioters, received their petition and induced them to disperse. But the backwoodsmen were able to point out the inconsistency of those who would fly to arms to protect Indian "heathen" and leave Christian white men exposed to the rapine of wolfish savages. With the return of peace the quarrel with the proprietary once more came to the fore. It was discovered that the "donation" of £5,000 was to be paid in dribblets, as money could be extracted from tenants whose quitrents were in arrears. The proprietors at last shut off all remonstrances by announcing that they would receive none. This filled the measure. They had reserved the best land for speculative purposes, yet required property thus held for private gain to be relieved of all burdens, as though it were public domain. They would contribute nothing to the defense of the province, including their own possessions; yet they would not consent to a law to establish a militia unless they should have the appointing of the officers and thus control the force. They had constituted themselves as a non-resident and irresponsible cabal, whose secret instructions their deputy, the governor, was under bonds to carry out, and now they denied the right of petition, one of the most valued privileges secured to freeborn Englishmen by the Bill of Rights. The question submitted to the electors by the assembly in 1764, whether the king should not be requested to take over the government of Pennsylvania as a Crown colony, was answered affirmatively after the hottest political campaign the province had ever known. Franklin was defeated of re-election, but he was commissioned to present a petition of the assembly to the above effect to the king's council in London. The petition was duly presented, but was not pressed, other and graver issues having meanwhile arisen; but the revolt against the proprietary was a premonition of the coming revolution.

Boundary Controversies.—Colonel Mark-

ham, Penn's first deputy, had scarcely arrived at New Castle in 1681 when he became involved in a boundary dispute with Lord Baltimore. The 40th parallel, named in the royal charter as the southern boundary of Pennsylvania, was supposed to be the latitude of New Castle but to the consternation of Markham and the gratification of Baltimore it was found that the 40th degree ran to the north of the site of Philadelphia. The proprietor of Maryland also claimed title to all the western bank of the Delaware River up to his northern line. But a reservation in the Maryland charter, which excluded lands "previously settled," saved the three southern counties for Penn—the Swedes' colony being held to constitute a previous settlement within the meaning of the grant. On other points the position of Lord Baltimore was apparently impregnable. He sent an armed force into the peninsula and established a fort on the Susquehanna near Columbia. At this point his proceedings were stayed by the Privy Council, but not until 1763, when it had been located and surveyed by two English surveyors, Mason and Dixon, was the divisional line between Maryland and Pennsylvania definitely fixed. It follows lat. 39° 43' 26.3" N. The Virginia claim, founded in part on the vaguely worded charter of that colony, had a more substantial basis in the grant by George II in 1749 to the Ohio Company of 500,000 acres on the "Forks of the Ohio" for the purpose of establishing a settlement as a barrier to the French. The company and the proprietors arranged a *modus vivendi*, however, and the action of Lord Dunmore, governor of Virginia, who assumed control of nearly the whole of Westmoreland County, caused Fort Pitt to be rebuilt, and on 25 April 1774 issued a proclamation commanding the militia to "repel the insults of Pennsylvania" and the inhabitants to decline payment of quitrents for land "freely given" by Virginia, was evidently intended to provoke dissensions between the colonies then falling into line in united opposition to the British Crown. In 1779 the differences between Pennsylvania and Virginia were amicably settled by a joint commission. The determination of the northern boundary was begun when David Rittenhouse, who was commissioned by Gov. John Penn to locate the line in 1775, fixed a mark on the Delaware River in lat. 42° N. for its starting point. The line was surveyed to Lake Erie in 1786 and 1787 pursuant to acts of the legislatures of both States and confirmed in 1789. The "Erie Triangle" formed part of the claims of both Massachusetts and New York in the Northwest Territory, which they ceded to the United States in 1781 and 1785, respectively. The triangle was thereupon purchased from Congress by Pennsylvania and the transaction was confirmed in a deed or warrant signed by President Washington in 1792. The Connecticut claim had for its basis Yankee cheek and the Connecticut charter of 1662, which purported to grant to the governor and company the territory bounded on the east by Narragansett Bay, on the north by Massachusetts and "with this breadth stretching westward to the South Sea," that is, the Pacific Ocean. A settlement of boundaries had been arranged with the authorities of New York before 1683; but the intervention of a few thousand square miles of neutral territory was

not enough, in the opinion of the calculating New Englanders, to prevent their territory taking up its march across the continent on the further side of New York. Certain citizens of Windham County, Conn., in 1753 petitioned the General Court to organize them as the Susquehanna Company and give them a quitclaim of 16 square miles of land on both sides of the Susquehanna River. The plan was approved and an inflow of settlers from Connecticut to the new country in the Wyoming Valley almost immediately began. The company was joined by the most prominent people in Connecticut; it bolstered up its title with purchases from the Indians, 10,000 square miles of which were laid out into shares, townships were surveyed and mills and cabins built. The War of Pontiac caused the suspension of operations for a time, but in 1769 when "Forty Fort" was built, five townships created, each five miles square, and each offered to 40 settlers who would defend the same, the proprietors of Pennsylvania took notice of the proceedings. They in turn leased lands to settlers who would agree to defend them and the manors of Stoke and Sunbury were established. Now began what is known as "the Pennamite and Yankee War." The Pennsylvania garrison at Wilkesbarre was besieged by the Yankees. "Forty Fort" was stormed by the Pennamites. Alternately the latter were imprisoned in the New England forts and the New Englanders, taken by sheriffs' posses, locked up in Philadelphia. The Pennsylvania assembly refused to interfere because the disturbances did not affect the general government and the inhabitants of Wyoming continued to extend their settlement, passing laws, collecting taxes and even establishing a militia. The Connecticut legislature in 1773 resolved to support the colony. The proprietary, so stingy when the protection of settlers from Indian war parties was required, readily enough found means to defend its land titles. But when Governor Penn, in December 1775, sent an armed force of 500 men to dispossess the trespassers, and the latter had repulsed the invaders at Nanticoke with loss of life on both sides, the Continental Congress was moved to interfere. The combatants were directed to desist from hostilities until a legal determination of the dispute could be had. On petition of the supreme executive council of Pennsylvania, Congress, in 1782, nominated commissioners who decided that Connecticut had no claim to the territory. Connecticut acquiesced in 1800.

The New Commonwealth.—At the outbreak of the Revolution there was not anywhere in America a legislative body more democratic and more firmly opposed to the tyrannic exercise of royal prerogatives than was the Pennsylvania assembly. It promptly elected delegates to the Continental Congress, and voted money to aid Massachusetts in the conflict with the royal army. It went as far in resistance as Quaker scruples against war and violence would permit and had, rather reluctantly, consented to the appointment of a Committee of Safety (of which Franklin became president), empowered to call the people to arms. Government by Quaker meeting, however, would no longer serve. When Congress early in 1776 passed a resolution advising the colonies to organize governments fitted to meet present exigencies the Com-

mittee of Safety prescribed qualifications for electors, whereby all "enemies of liberty" were disfranchised and ordered a Constitutional Convention. The convention met on 15 July, declared the existing government unfit, adopted a "Bill of Rights and Constitution for the Commonwealth of Pennsylvania" and delivered the same to the assembly, which, uttering a feeble protest, adjourned on 16 September, never to meet again. The convention as a council of safety assumed the whole political power of the province. The Quakers as a body withdrew from public affairs. They were, rather unjustly, however, included with the Tories. They would not surrender their conscientious scruples against shedding blood, but they bore without complaint the heavy burdens imposed by the revolutionary council of safety on non-combatants and many of the younger men, undeterred by the fear of being "disowned" by the disciplinary meetings, joined the Revolutionary army. From 1776 to the end of the war Pennsylvania was Washington's base of operations; from hence he executed his raids into New Jersey and marched down to victory at Yorktown. Except during the occupation of the city by the British, under General Howe, from the fall of 1777 to the summer of 1778, the Continental Congress sat in Philadelphia. The Paoli massacre, the bivouac of the Continental army under Washington at Valley Forge and the reign of the mob following the withdrawal of General Howe, were the most stirring military and political events of the Revolution in Pennsylvania save one—the tragedy of Wyoming. The annihilation of the Connecticut settlement in 1778, while the able-bodied men were absent serving in the ranks of the Continental army, was the crowning infamy of British rule in America. The outrage was terribly avenged in 1779 when 3,000 men under General Sullivan marched into the country of the Six Nations, who with some English soldiers had committed the atrocity, and broke their power for mischief for all time. The constitution of 1776 created a legislature, the general assembly, consisting, like the provincial assembly, of a single chamber. The prejudices of the time against concentrated power were reflected in the institution of a plural executive, the supreme executive council. A council of censors to be elected once in seven years, and empowered to order impeachments, to rectify injustice in the levy of taxes and to direct the repeal of improper laws, was to act as a curb on possible legislative, executive and judicial tyranny. The general assembly thus tied could accomplish little. It secured from the proprietors in 1779, for a consideration of £130,000, a transfer of their property, exclusive of their manors and private estates, some of which belong to the Penn family to this day; in 1780 a law was passed giving freedom to all children born of slaves after that date; it procured the ratification by Pennsylvania of the Federal Constitution on 12 Dec. 1787, within three months after its submission to the States, and by this prompt action probably saved it from defeat. The frame of government of 1776, however, proved unworkable and on 2 Sept. 1790 a new State constitution, modeled on the recently adopted Constitution of the United States, was formally proclaimed. Thomas Mifflin, a "fighting Quaker"

and a Democrat, became the first governor of the State. He was twice re-elected serving until December 1799. During his term occurred the "Whisky Rebellion" (q.v.) and the "Hot Water War." The latter, a mere tumult in the German counties, was caused by a misunderstanding of the nature of the house tax ordered by Congress in 1798 and by the harangues of John Fries, an itinerant auctioneer with a stentorian voice and a gift of repartee, which nearly cost him his neck. The "traitor" was pardoned by Washington. The discovery of the utility of anthracite as fuel led to the canalization of the Lehigh River in 1818, and this and the improvement of the navigation of the Schuylkill in 1825, with a view to bringing the product of the lower coal fields to market, gave the impetus to the construction of State works on a scale which, for those times, was colossal. The ridge of the Alleghenies seemed to have been created for the purpose of thwarting the people, but they would not be balked. The rivers which could not be made navigable were to be paralleled by canals and were to be connected one with the other so that continuous water communication should be established between eastern Pennsylvania, central New York and the Mississippi Valley. The main lines to the West was to run by way of the Juniata, the Conemaugh and a portage railway, whereby boats were to be lifted over the intervening mountain. Before 1829 the State owned 450 miles of canals and had expended \$6,000,000 in construction. The works undoubtedly had a beneficent effect; they increased traffic and thus promoted the public welfare. But they exercised a corrupting influence in politics and nearly bankrupted the State. By 1840 the Commonwealth owned 726 miles of railways and canals, which had cost \$26,500,000, and 200 miles were under construction; the entire income from them was required or had been pledged to pay interest on the debt incurred, and State stocks had become "an unsalable drug in the market." The State had been made the victim of gross frauds by contractors; the principle of short tenures and rotation in office applied to surveyors, engineers, etc., was not conducive to efficient and economical management; the most profitable branch of the business, the carriage of passengers, was farmed out to private corporations especially created for that purpose by pliant legislators. The total receipts from the public works from 1830 to 1859 amounted to \$32,270,712.55; the expenditures were \$30,400,433.07. The debt of the State, before rock bottom was reached, amounted to nearly \$41,000,000. The works were finally sold, the main line to the Pennsylvania Railroad in 1856, nearly all the rest in 1857—the State realizing about \$11,000,000 from the sale. The deliberate verdict of the people on State ownership was expressed in the Constitutional Amendment of 1857, forbidding partnerships between the Commonwealth and transportation, banking and other companies, and limiting the borrowing powers of the legislature to \$750,000. Down to 1860 Pennsylvania was normally a Democratic State, though by a small majority; and the Whigs occasionally controlled the government—sometimes through coalitions, as with the Anti-Masons in 1835 and the "Know-Nothings," in 1854. "As goes Pennsylvania so goes the Union," had been a maxim in American

politics for two generations, and when Andrew J. Curtin, the first Republican governor, was elected in October 1860 by a majority of 30,000, the supporters of Lincoln were justified in their hope, to be realized a month later, that they would carry the country. Six days after the bombardment of Fort Sumpter, two regiments of Pennsylvania troops marched into Washington—the first to arrive in defense of the national capital. The first call for volunteers in the Civil War was responded to by nearly twice the 75,000 required, and Governor Curtin was enabled to organize a reserve of 11 regiments besides the 14 which constituted the quota of the State. Altogether Pennsylvania contributed 362,284 men to the Union armies, exclusive of militia. The State was thrice invaded; the invasions of 1862 and 1864 were mere raids, but it was "the high tide of the Confederacy" which rolled into Cumberland Valley in July 1863 and was forced back at Gettysburg. Among the generals who commanded in that three days' battle Geary, Hancock, Meade and Reynolds were natives of the State.

Since the Civil War the history of the Commonwealth has been mainly the history of its industries and commerce. A new constitution was adopted in 1873, which effected many important changes, chiefly in the restriction of the powers of the legislature and of common carriers. The abuses which had grown out of special legislation and the passage of "omnibus" bills were enjoined with searching minuteness; municipal and other corporations were thereafter to be organized only under general laws, and a whole article, containing 33 sections and many sub-sections, was devoted to an enumeration of the things which the general assembly should not be permitted to do. Railroads and canal companies were forbidden to make any "undue or unreasonable" discrimination in rates or in the furnishing of cars or motive power; to own, lease or control competing and parallel lines or to engage in manufacturing, mining or other business except that of transportation—the convention anticipated the Interstate Commerce Law by more than 10 years. The financial panic of 1873 and the succeeding years of industrial stagnation were attended, as are all crises in human history, by serious social disturbance. The story of the reign of terror instituted in the anthracite regions by the "Molly Maguires" (q.v.) in 1873 pertains to the history of crime rather than of industry, and the "Mollies" were a sprout from foreign soil. The railway riots of July 1877, which centred in Pittsburgh, cannot be dismissed, however, as having been manifestations of imported lawlessness. The local authorities displayed lamentable weakness in permitting the mob to grow to dangerous dimensions; they were guilty of something worse than negligence if the testimony that the militia were fired on from a police station be credible. In 1892 again forcible methods to prevent a reduction of wages plunged a part of the Commonwealth into a state bordering on civil war when the military and the striking steel workers confronted one another at Homestead. But contempt for the law may be shown in other manner than by the commission of crimes of violence. The secret traffic agreement, which was a most potent factor in the upbuilding of

the oil monopoly, was in direct conflict with the constitutional provision against unfair preferences by carriers; the combination of the anthracite mining and carrying companies circumvents, if it does not violate, the letter and spirit of the constitution of 1873. The great

strike of the anthracite miners in 1902 disclosed the progressive perfection attained in the organization of the labor unions. The consent of the parties to arbitration, though reluctantly given was an acknowledgment of the superior rights of the general community. One outcome of the

LIST OF GOVERNORS OR EXECUTIVES OF THE DUTCH AND SWEDISH COLONIES ON THE DELAWARE
AND OF THE PROVINCE AND COMMONWEALTH OF PENNSYLVANIA.

COLONIAL GOVERNMENTS.

Peter Minuit, Governor of New Sweden.....	1638-1641
Peter Hollender, Governor of New Sweden.....	1641-1643
John Printz, Governor of New Sweden.....	1643-1653
John Pappegoya, Governor of New Sweden.....	1653-1654
John Claude Rysinghe, Governor of New Sweden.....	1654-1655
Peter Stuyvesant, Governor of New Netherlands.....	1655-1664
Col. Richard Nicholls, Governor of New York.....	1664-1667
Col. Francis Lovelace, Governor of New York.....	1667-1673
Anthony Colve, Governor of New Netherlands.....	1673-1674
Sir Edmund Andross, Governor of New York.....	1674-1681

PROVINCIAL GOVERNMENT.

William Penn, Proprietor.....	1681-1718
William Markham, Deputy Governor.....	June 1681-June 1682
William Penn, Governor in person.....	Oct. 1682-June 1684
Thomas Lloyd, President of the Council.....	Aug. 1684-Dec. 1686
Capt. John Blackwell, Deputy Governor.....	Dec. 1686-Jan. 1690
Thomas Lloyd, President of the Council.....	Jan. 1690-Mar. 1691
Thomas Lloyd, Deputy Governor for Province.....	Mar. 1691-April 1693
William Markham, Deputy Governor for Lower Counties.....	April 1693-Mar. 1695
William Markham, Deputy Governor under the Crown.....	Mar. 1695-Dec. 1699
William Markham, Deputy Governor under the Proprietor.....	Dec. 1699-Nov. 1701
William Penn, Proprietor and Governor.....	Nov. 1701-April 1703
Andrew Hamilton, Lieutenant-Governor.....	April 1703-Feb. 1704
Edward Shippen, President of the Council.....	Feb. 1704-Feb. 1709
John Evans, Lieutenant-Governor.....	Feb. 1709-July 1717
Charles Gookin, Lieutenant-Governor.....	May 1717-July 1718
Sir William Keith, Lieutenant-Governor.....	1718-1746
John, Richard and Thomas Penn, Proprietors.....	July 1718-July 1726
Sir William Keith, Lieutenant-Governor.....	July 1726-Aug. 1736
Patrick Gordon, Lieutenant-Governor.....	Aug. 1736-Aug. 1738
James Logan, President of the Council.....	Aug. 1738-May 1746
George Thomas, Lieutenant-Governor.....	1746-1776
Thomas Penn and John, son of Richard, Proprietors.....	May 1746-May 1747
George Thomas, Lieutenant-Governor.....	May 1746-Nov. 1748
Anthony Palmer, President of the Council.....	Nov. 1748-Oct. 1754
James Hamilton, Lieutenant-Governor.....	Oct. 1754-Aug. 1756
Robert Hunter Morris, Lieutenant-Governor.....	Aug. 1756-Oct. 1759
William Denny, Lieutenant-Governor.....	Oct. 1759-Nov. 1763
James Hamilton, Lieutenant-Governor.....	Nov. 1763-April 1771
John Penn, Lieutenant-Governor.....	April 1771-Oct. 1771
James Hamilton, President of the Council.....	Oct. 1771-Aug. 1773
Richard Penn (brother of John), Lieutenant-Governor.....	Aug. 1773-July 1776
John Penn, Lieutenant-Governor.....	

GOVERNMENT OF THE COMMONWEALTH.

Benjamin Franklin, Chairman Committee of Safety.....	17 Sept. 1776-4 Mar. 1777
Thomas Wharton, Jr., President Executive Council.....	5 Mar. 1778-23 May 1778
George Bryan, acting, vice Wharton, deceased.....	23 May 1778-1 Dec. 1778
Joseph Reed, President Executive Council.....	1 Dec. 1778-8 Oct. 1781
William Moore, President Executive Council.....	14 Nov. 1781-8 Oct. 1782
John Dickinson, President Executive Council.....	7 Nov. 1782-18 Oct. 1785
Benjamin Franklin, President Executive Council.....	18 Oct. 1785-14 Oct. 1788
Thomas Mifflin, President Executive Council.....	5 Nov. 1788-20 Dec. 1790
Thomas Mifflin, Governor.....	21 Dec. 1790-17 Dec. 1799
Thomas McKean, Governor.....	17 Dec. 1799-20 Dec. 1808
Simon Snyder, Governor.....	20 Dec. 1808-16 Dec. 1817
William Findlay, Governor.....	16 Dec. 1817-19 Dec. 1820
Joseph Hiester, Governor.....	19 Dec. 1820-16 Dec. 1823
John Andrew Shulze, Governor.....	16 Dec. 1823-15 Dec. 1829
George Wolfe, Governor.....	15 Dec. 1829-15 Dec. 1835
Joseph Ritner, Governor.....	15 Dec. 1835-15 Jan. 1839
David Rittenhouse Porter, Governor.....	15 Jan. 1839-21 Jan. 1845
Francis Rawn Shunk, Governor.....	21 Jan. 1845-9 July 1848
William Frame Johnston, Governor.....	26 July 1848-20 Jan. 1852
William Bigler, Governor.....	20 Jan. 1852-16 Jan. 1855
James Pollock, Governor.....	16 Jan. 1855-19 Jan. 1858
William Fisher Packer, Governor.....	19 Jan. 1858-15 Jan. 1861
Andrew Gregg Curtin, Governor.....	15 Jan. 1861-15 Jan. 1867
John White Geary, Governor.....	15 Jan. 1867-21 Jan. 1873
John Frederick Hartman, Governor.....	21 Jan. 1873-21 Jan. 1879
Henry Martyn Hoyt, Governor.....	21 Jan. 1879-16 Jan. 1883
Robert Emory Pattison, Governor.....	16 Jan. 1883-18 Jan. 1887
James Addams Beaver, Governor.....	18 Jan. 1887-20 Jan. 1891
Robert Emory Pattison, Governor.....	20 Jan. 1891-15 Jan. 1895
Daniel H. Hastings, Governor.....	15 Jan. 1895-17 Jan. 1899
William A. Stone, Governor.....	17 Jan. 1899-15 Jan. 1903
Samuel W. Pennypacker, Governor.....	20 Jan. 1903-15 Jan. 1907
Edwin S. Stewart, Governor.....	15 Jan. 1907-17 Jan. 1911
John K. Tener, Governor.....	17 Jan. 1911-19 Jan. 1915
Martin G. Brumbaugh, Governor.....	19 Jan. 1915- Jan. 1919
William C. Sproul.....	Jan. 1919- Jan. 1923
Gifford Pinchot.....	Jan. 1923-

arbitration was the judicial recognition of the principle of collective bargaining. Since 1860 Pennsylvania has been overwhelmingly Republican. The late Governor Pennypacker became official authority for the statement that the Commonwealth "has no ills worth mentioning." There were political evils, plenty of them, in the good old times, and such as exist are, perhaps, no greater and no more incurable than those which have been grappled with and remedied in other days. While not marching in the forefront, Pennsylvania's legislators have kept step with those of the more progressive sister States. A public service commission with adequate powers has been created. Child and woman labor laws according to the best models have been passed and a system of workman's compensation and State insurance against the accidents of industry has been established, which has many points of excellence. The election laws have been radically reformed, but the ballot law remains one of the worst in the country. The long continuance in power of one party, whose managers feel secure against effective criticism through their command over majorities counted by the hundred thousand, is no doubt an evil in itself. Under such conditions a really healthy political life is impossible. Broadly speaking, the community has advanced steadily, ethically as well as materially; the course of human progress has eddies and cross-currents here as elsewhere. Experience, as Franklin remarked, keeps a dear school, but the lessons of this hard task-mistress, once they have been thoroughly mastered, are as likely to be heeded in the future as they have been in the past.

STEPHEN PFEIL,

Formerly Editor of the Philadelphia Press.

PENNSYLVANIA, University of, located at Philadelphia. In 1749 Benjamin Franklin published a pamphlet entitled 'Proposals Relating to the Education of Youth in Pennsylvania,' and shortly afterward 24 citizens of Philadelphia associated themselves for the establishing of an "academy." They joined with the new institution a charitable school which had been in existence since 1741 and the building occupied by this school became the home of the two schools so combined. The academy classes were first opened in 1751 and the free charitable part of the institution was maintained until well into the 18th century, when the charitable feature was merged into free scholarships in the college. In 1753 the treasurer obtained a charter from the proprietors of the colony of Pennsylvania in which the institution was designated as a "college and academy." In 1761 the college was in need of funds, and Dr. Smith, the provost, was sent to England to raise money for an endowment. There he met the commissioner from King's College (now Columbia) who had come on a similar errand, and they agreed to aid each other; through the influence of the archbishop of Canterbury, they obtained a circular letter from the king to all the churches, and succeeded in raising a considerable amount of money for each college. During the Revolution the college did not prosper; the attention of students was diverted by the stirring events of the time and the city was for a time occupied by British troops; hence the college was closed for over a year and a half and the buildings used for other purposes, being the meeting place of the Congress for several days in July 1778. In 1779 the legislature, on a pretext that the original plan of the college was not being carried out, seized its rights and properties and transferred them to a new organization, called the "Trustees of the University of the State of Pennsylvania"; in 1789 the property was restored, and in 1791 the old college and the university united under the corporate name of the University of Pennsylvania. For several years (1802-29) the university occupied the house which was built for the residence of the President of the United States, when it was expected that Philadelphia would become the national capital; and later new buildings were erected on the same site. In 1872 the university was moved to its present site in West Philadelphia and the original group of four buildings erected. The most marked growth has taken place since that time; the work of the old departments extended and many new buildings added.

The first professional department established was that of medicine, founded in 1765, being the first medical school in the United States. Lec-

tures in law were given in the university as early as 1790, but the law department did not receive its present organization till 1850. The university was among the earliest to undertake systematic instruction in science, technology and engineering. In 1852 it was resolved to establish a department of mines, arts and manufactures, and professorships in geology and mineralogy, civil engineering and mining; also two regular courses in science were offered. In 1874 John Henry Towne, a trustee, made the university the residuary legatee of his estate; whatever sum might accrue from this bequest to form a portion of the endowment fund of the university, and the income from it to be devoted exclusively to the payment of the salaries of professors and instructors in the department of science. In recognition of this gift the department was named the "Towne Scientific School of the University of Pennsylvania." The present organization of the university includes: the College, the Graduate School, the Law School, the School of Medicine, the University Hospital, the Wistar Institute of Anatomy and Biology, the Laboratory of Hygiene, the School of Dentistry, the School of Veterinary Medicine, the Veterinary Hospital, the University Library, the University Museum, the Flower Astronomical Observatory, the Department of Physical Education, the Wharton School, the Towne Scientific School, the School of Education, the Henry Phipps Institute, the Graduate School of Medicine, the Evans Institute. The School of Arts confers the degree of A.B. Electives were first introduced to a slight extent in 1867; and the number of elective studies for the junior and senior years were increased in 1887. In 1893 the group system was established, by which privilege of election in certain subjects was carried into the first two years.

The Wharton School of Finance and Commerce is intended to give special training to students who expect to enter banking, insurance, railway service, manufacturing, law and public service, social work or accounting. Graduate courses are also offered to advanced students in the same general fields. The object of the Wistar Institute of Anatomy and Biology is to afford facilities to post-graduates and advanced students; it is a distinctive corporation with separate funds, but organically united with the university so as to constitute one of its departments. The library is one of the original departments of the university, and contains many interesting historical documents; it includes several special libraries, and contained (1919) nearly 500,000 volumes. The University Museum (organized 1889) was made a department of the university in 1891; in 1902 E. W. and C. H. Clark founded, in this department, the Clark Research Chair of Assyriology. Women are admitted to a number of the courses. The present site of the university is on rising ground, half a mile west of the Schuylkill River; the buildings number 33; among them are Houston Hall, the centre of the student social life, College Hall, the library, the University Museum and the gymnasium. Among the notable new buildings are the laboratories for engineering and medicine, which together have cost \$1,500,000. Much attention is paid to systematic physical culture and to general athletics. There is an athletic

field (Franklin field) which is equipped with a gymnasium and a stadium which accommodates nearly 25,000 persons. The final control of athletic sports is vested in the Council on Athletics.

The students have a number of large debating societies, dramatic societies and musical clubs. The Greek letter fraternities are well established, 43 having chapters, many of which have attractive fraternity houses. Consult Lippincott, H. M., 'The University of Pennsylvania' (1919).

PENNSYLVANIA, Western University of. See WESTERN UNIVERSITY OF PENNSYLVANIA.

PENNSYLVANIA COLLEGE, a non-sectarian institution of learning at Pittsburgh, Pa., founded in 1870. Its faculty numbers 19; the average annual enrolment of students is 185; tuition fees are \$120; living expenses, board, etc., \$250 to \$350; the productive funds amount to \$420,000; total income, including tuition and incidental charges, \$83,840. The college colors are orange-blue. The library contains over 5,000 volumes. The graduates since enrolment number 1,242.

PENNSYLVANIA COLLEGE OF GETTYSBURG, located at Gettysburg, Pa. It was chartered in 1832 under the auspices of the Lutheran Synod of Pennsylvania. In 1850 the charter was modified to incorporate Franklin and Marshall College, and the Franklin professorship was endowed by the funds thus obtained. When in 1863 Pennsylvania was threatened with invasion a company formed mainly of students of the college was the first to respond to the call for volunteers and became Company A of the 26th Emergency Regiment. Though this took away the majority of the students the college remained in session until the day of the battle of Gettysburg. The college buildings were used for hospital purposes, and it is estimated that they sheltered at least 500 wounded Confederates. The college offers two regular courses, classical and scientific, leading respectively to the degrees of A.B. and B.S.; and provision is made for special work for those who are not candidates for a degree, and for graduate work leading to the degrees of A.M., M.S. and Ph.D. There is also a preparatory department. The work of the junior and senior years is partially elective. In 1888 all departments of the college were opened to women, the preparatory department being already open to them; there is no women's dormitory, however, and the number entering is small. The buildings include (1916) four dormitories, recitation hall (containing the library), the chapel, the chemical laboratory, the astronomical observatory, the gymnasium and the academy. The library contains over 37,500 volumes, including the regular college library and the libraries of the two literary societies. In 1916 the annual income was \$60,000; the students numbered 447, and the faculty 28. The courses of study are arranged in 10 groups as follows: Greek and Latin; Latin and Modern Languages; History and Political Science; Chemistry and Physics; Biology, Chemistry and Physics; Commerce and Finance; Civil Engineering; Municipal Engineering; Mechanical Engineering; and Electrical Engineering. The first three courses lead

UNIVERSITY OF PENNSYLVANIA

1 Dormitory Terrace

2 Campus — Library and College Hall Tower

to the degree of A.B. while the last seven lead to the degree of B.S.

PENNSYLVANIA COLLEGE FOR WOMEN, located at Pittsburgh, Pa. It was founded in 1869 under the auspices of the Presbyterian Church. The collegiate department offers a classical and a literary course and confers the degree of A.B. Instruction is given in music and art, and there is also a preparatory department. A department of social service gives special training in that sphere of effort, and practical work in the field is arranged for in connection with the widely diversified philanthropies and charities of the city of Pittsburgh. In 1923 the grounds and buildings were valued at over \$600,000; annual income figures not available. The library contained 5,000 volumes; students numbered 221 and faculty 31.

PENNSYLVANIA DUTCH, a dialect, partly English and partly German (often corrupt), spoken by the descendants of the original German settlers of parts of Pennsylvania.

PENNSYLVANIA-GERMAN SOCIETY, a patriotic-historical association organized 15 April 1891, at Lancaster, Pa., to collect, preserve and publish letters, papers and documents relating to the biography, genealogy, history and folklore of the Pennsylvania-Germans in America, and to gather into a permanent library all books pertaining thereto. The members must be direct descendants of early German or Swiss emigrants to the colony of Pennsylvania. There are about 400 members, embraced in three classes: regular, associate and honorary. Meetings are held annually. The Society has published 25 volumes of their proceedings, together with much historical material, and of late years has reprinted many of its earlier volumes.

PENNSYLVANIA HISTORICAL SOCIETY, organized in Philadelphia, 2 Dec. 1824, and incorporated 2 June 1826, is famous for its valuable collection of material, historical and genealogical, relating to the State, its founders and prominent families. Notable are the records and papers of the Penn family, the Charlemagne Tower collection of American colonial laws, first editions of Bradford, Franklin and Christopher Saur books, early American printed handbills, pamphlets, portraits and relics. The subscribed publication fund of the society amounts to \$40,000. Since 1877 the *Pennsylvania Magazine of History and Biography* has been issued quarterly and now comprises over 40 volumes; besides 14 volumes of *Memoirs of the Society*; one of *Bulletins*; one of *Collections*; one on 'Pennsylvania and the Federal Constitution' and an historical map of the State. In the library are over 5,000 volumes of manuscripts, about 260,000 special pamphlets and over 152,000 bound books.

PENNSYLVANIA RAILROAD COMPANY, The. The incorporate name of one of the great transportation systems of the United States. It controls and operates the network of railroads east of Pittsburgh and having its centre in the State of Pennsylvania. A second corporation organized in 1871, with a present capitalization of \$80,000,000, is called the Pennsylvania Company and controls and operates the railroads of the system west of Pittsburgh. The railway, ferry, canal and other

transportation lines, owned, operated or controlled by, or affiliated in 1915 with, the Pennsylvania Railroad system have an aggregate mileage as follows: East of Pittsburgh, 6,519.02 miles; west of Pittsburgh, 5,303.99; making a total of 11,823.01 miles. The company owns and operates directly, east of Pittsburgh, a total mileage of 4,541.04, in five divisions, as follows:

Eastern Pennsylvania Division.....	1,339.55 miles
Western Pennsylvania Division.....	741.69 miles
New Jersey Division.....	541.08 miles
Central Division.....	1,112.62 miles
Northern Division.....	806.10 miles
Total.....	4,541.04 miles

The first-named division is composed of the original parent lines of railroad, several of which had their beginning in the early half of the 19th century. On 7 April 1826, the Pennsylvania legislature granted a charter to the Columbia, Lancaster and Philadelphia Railroad Company. In 1832 among other roads incorporated were the Harrisburg, Portsmouth, Mount Joy and Lancaster and the Philadelphia and Trenton. In 1833 the Columbia Railroad was built.

Early History.—On 13 April 1846 an act to incorporate the Pennsylvania Railroad Company was passed by the State legislature. The capital of the company was fixed at \$7,500,000. The company was authorized to build a road to connect with the Harrisburg, Portsmouth, Mount Joy and Lancaster Railroad, and to construct a line to Pittsburgh or any other place in the county of Allegheny, or to the town of Erie. On 25 Feb. 1847 Governor Shunk granted a charter to the company. The grading of the first 20 miles of road west of Harrisburg was under contract 16 July 1847 and 40 miles additional on 26 November. On 1 Sept. 1849 the first division, extending from Harrisburg to Lewistown, a distance of 61 miles, was opened to travel. On 15 Feb. 1854 cars run through from Philadelphia to Pittsburgh. On 31 July 1857 (pursuant to provisions of an act of the Commonwealth of Pennsylvania of 16 May 1857) the Commonwealth of Pennsylvania sold and conveyed to The Pennsylvania Railroad Company, inter alia, a line of railroad and facilities between Philadelphia and Columbia, Pa., known as the Philadelphia and Columbia Railroad, with power to operate and extend the same. In 1861 the Harrisburg, Portsmouth, Mount Joy and Lancaster Railroad was leased by the Pennsylvania Company for 999 years, which gave the corporation the ownership of the through line from Philadelphia to Pittsburgh.

Civil War Period.—J. Edgar Thomson, the chief engineer of the company, under whose direction the road was built, was elected president of the company 2 Feb. 1852. In 1858 Col. Thos. A. Scott was appointed general superintendent of the road; he became vice-president in March 1860. It was Colonel Scott who, at the outbreak of the Civil War, was appointed to take charge of government railroads and telegraphs. He was instructed by Simon Cameron, Secretary of War, after the destruction of the Northern Central Railway, to open a line of communication from Washington to Philadelphia and the North and East. The

Pennsylvania Railroad Company at once placed all its resources at the disposal of Colonel Scott, and a route via Annapolis and Perryville was placed at the disposal of the government in a few months.

In 1862 the Philadelphia and Erie Railroad passed to the control of the Pennsylvania Company under a lease for 999 years. Meanwhile the road had improved its main lines and branches, and in 1864 began the use of steel rails and the development of their manufacture.

Western Lines.—The next important undertaking was to aid the construction of lines west of Pittsburgh. The Pittsburgh, Fort Wayne and Chicago Railroad was the first of these to be built, work on which commenced 4 July 1849, extending 468 miles from Pittsburgh to Chicago, and being the essential link in the chain which was to bind the Atlantic Seaboard and the Mississippi Valley. On 7 June 1869 this road was leased by the Pennsylvania Railroad Company for 999 years; as was also Newcastle and Beaver Valley Railroad, the Massillon and Cleveland Railroad, the Akron Branch Railroad and the Lawrence Railroad, all in Ohio. On 6 Nov. 1867 the Pittsburgh and Steubenville Railroad was sold at auction and was purchased by the Pennsylvania. In 1869 the leases were signed for the control of the Pittsburgh, Cincinnati and Saint Louis Railroad and its numerous branches. In 1869 the Cincinnati and Muskingum Valley and the Saint Louis, Vandalia and Terre Haute, and the Terre Haute and Indianapolis roads were added, thus extending the line to the Mississippi River at Saint Louis. In March 1870 the Erie and Pittsburgh was leased and in October 1871 the Cleveland and Pittsburgh was also leased for 999 years. In the same year the Pennsylvania purchased a controlling interest in the Jeffersonville, Madison and Indianapolis, extending from Indianapolis, Ind., to Louisville, Ky. Other roads, large and small, were added to the system from time to time, embracing important direct and connecting lines in Ohio, Indiana, Illinois, Michigan, Kentucky, West Virginia, Missouri and other States.

Eastern Development.—After the Civil War the Pennsylvania made rapid progress east of Pittsburgh. Between 1868 and 1872 the company leased the Philadelphia and Trenton Railroad; Camden and Amboy Railroad and the United New Jersey Railroad and Canal Company; and in 1873 completed the Baltimore and Potomac Railroad, and built the Baltimore Tunnel. Further acquisitions of connecting lines have since been made from time to time, including the Allegheny Valley Railway, the Western New York and Pennsylvania Railway, Cambria and Clearfield Railway and the Northern Central Railway. Numerous branch lines were built in the mining and lumber districts, the principal of which was the Schuylkill Valley Railroad, from Philadelphia to Pottsville, Pa., and Wilkesbarre, which brought the anthracite coal region in touch with the main line. The company has a four-tracked line from New York to Pittsburgh, a double-tracked line from Pittsburgh to Chicago. A tunnel under the Hudson River, with a terminal in New York City, and an extension to Long Island, opened 8 Sept. 1910, is one of the more recent improvements instituted by this company, affording great transportation facilities to all points men-

tioned. The tunneling of the two rivers and Manhattan Island was the most notable piece of underground engineering ever undertaken. See NEW YORK CITY.

The company has water lines on Chesapeake Bay and Long Island Sound, covering a distance of 2,000 miles of water transportation.

Finances.—The general income account of the Pennsylvania Railroad for the year ending 31 Dec. 1915 shows total operating revenues of \$196,628,170.10; total operating expenses, \$142,736,560.83; net operating revenue, \$53,891,609.27. The operating revenues are from lines directly operated and include freight, passenger, mail, express, other transportation and incidental maintenance of equipment, traffic, transportation, general and miscellaneous. After deducting taxes and uncollectible railway revenues, the railway operating income was \$46,250,924.68. Income from securities and other sources brings this up to \$66,626,245.34; deducting fixed charges from this leaves a net income of \$42,425,322.32.

Traffic Statistics.—The traffic statistics for all lines owned, operated or controlled by, or affiliated in interest with, the Pennsylvania Railroad system, both east and west of Pittsburgh, for 1915 were as follows:

PASSENGER			
			Number of passengers
			1915
			Comparison with 1914, decrease
Lines east of Pittsburgh and Erie.	140,879,300	9,073,329	
Lines west of Pittsburgh and Erie.	31,111,793	2,090,871	
Total.....	171,991,093	11,164,200	

FREIGHT			
			Number of tons
			1915
			Comparison with 1914, increase
Lines east of Pittsburgh and Erie.	182,187,383	8,553,398	
Lines west of Pittsburgh and Erie.	157,740,337	17,256,957	
Total.....	339,927,720	25,810,355	

Equipment.—The following figures show the equipment available for service on lines of the Pennsylvania system east and west in 1910:

Locomotives of all kinds.....	7,373
Passenger, express and mail cars.....	6,706
Freight cars.....	276,619
Maintenance of way, car equipment.....	4,536
Floating equipment, ferry boats, tugs, barges, etc	448
Total.....	295,682

The number of employees 31 Dec. 1910 in the service east of Pittsburgh was about 150,000; west of Pittsburgh about 60,000; making a total of 210,000. Applying the statistics of the last census that there is an average of five persons dependent upon the head of each family, it would seem that there are more than a million of people who depend directly upon the operations of the road for their means of subsistence. In addition, there are the employees of many industries supplying rails, cars, locomotives, etc., besides merchants of all classes in the cities and towns located along the roadway, whose prosperity is largely dependent thereon. The company asks and insists upon faithful service from

PENNSYLVANIA STATE COLLEGE

its employees. It administers a fund which takes care of them in cases of sickness or accident, and when their days of usefulness are over it provides them with a pension which cares for them in their declining years. The company also maintains an Employees Saving Fund, so that employees may leave on deposit with the company such portion of their wages as they may desire, upon which a stipulated rate of interest is allowed.

PENNSYLVANIA STATE COLLEGE,

The, located at State College, Pa., is one of the chain of "land-grant" colleges established in 1863 by the State and Federal governments under the Act of 1862. It was first chartered in 1855 as a Farmer's High School and in 1861 it graduated a class of 11, probably the first graduates in a purely agricultural course in the United States. It is beautifully situated on a plateau of the eastern slope of the Alleghany Mountains, 1,200 feet above sea-level. The total valuation of property under college control is \$3,306,422.66. About 1,400 acres of land are used for campus, farm and experimental purposes. The buildings number 35, harmonizing in location, architecture and building materials according to the school groups. There are six schools—Agriculture, Engineering, Home Economics, Liberal Arts, Mining and Natural Science—offering a total of 42 four-year courses of study. Courses in the Liberal Arts lead to the bachelor of arts and in other schools to the bachelor of science. Engineering and master's degrees are conferred on graduates after one year of study. The doctorate degree is not given. Short courses are offered in agriculture, industrial engineering, milling engineering and home economics. A summer session in which only teachers of Pennsylvania are permitted to register is a novel feature. A winter course of one week during the holidays for farmers and home-makers attracts over 1,000 students annually.

The experimental work of the college is conducted in an agricultural, an engineering and a mining experiment station, under Federal and State appropriations. The agricultural extension division maintains county agricultural agents in nearly every county of the State, offers correspondence courses, organizes boys' and girls' clubs, holds institutes and sends experts to help solve farming problems. The engineering extension division organizes and conducts apprentice schools in manufacturing plants and industrial centres. The liberal arts extension supplies lecturers, topics and material for clubs, and organizes public school debating leagues. Military drill and gymnasium practice are required of all students during the first two years in college, under instruction of officers detailed from the United States army. All forms of college sports are fostered; 40 acres of the campus are set aside for play- and drill-grounds. The trustees number 31, being divided into four classes: Ex-officio State officials; appointed by the governor; chosen by the alumni; and elected by delegates representing the learned societies of the State.

The following statistics are given for the college year ending 30 June 1923: Total instructors, 631; experimental and extension staff, 311. Total enrollment of college, 3,259; summer session, 2,688; grand total, 5,947. Total

in engineering apprentice schools, about 3,500; in correspondence courses, 4,500. Number of volumes in library, 85,200. The total income of the college from the United States, from State appropriations and from all other sources, was in 1922-23 \$2,307,799.

PENNSYLVANIAN SERIES, in geology,

one of the three principal subdivisions of Carboniferous time having the Permian above and Mississippian below. It occupies extensive areas in many parts of the United States, including the great coal measures of Pennsylvania, and the Central-Eastern and Southeastern States as far west as eastern Nebraska and Oklahoma. Farther west it consists mainly of limestone deposited in moderately deep water, a condition unfavorable for coal accumulation. Some geologists class the Pennsylvanian as uppermost Carboniferous, others regard it as a separate system or period.

PENNY, a British coin and money of account, in value the 12th part of a shilling. It was at first a silver coin weighing about 22½ grains troy, or the 240th part of a Saxon pound. Till the time of Edward I the penny was so deeply indented by a cross mark that it could be broken into halves (thence called half-pennies) or quarters (four-things or farthings). A "gold penny" was coined in 1257 during the reign of Henry III. It had the value of 20 silver pennies of that time. Edward I in 1300 reduced the weight of the penny to a standard, ordering that it should weigh the 20th part of an ounce, that is, 22 grains. Edward III reduced its weight three times, leaving it at 18 grains. Edward IV reduced it in 1464 to 12 grains and Henry VIII, in 1527, to 10½ grains. It was still further reduced to 8 grains under Edward VI in 1552, and at last, in the reign of Elizabeth, it was fixed at 7½ grains, or the 62d part of an ounce of silver. This proportion was observed up till the introduction of the bronze coinage in 1860. George III coined a copper penny in 1797. It weighed one ounce and did not come into favor because of its clumsiness. The intrinsic value of the bronze penny is about half of that of the old copper coin. The bronze of which the present British penny is coined is composed of copper, 95 per cent; tin, 4 per cent; and zinc, 1 per cent. Copper pennies were coined by the American colonies prior to 1780. See NUMISMATICS.

PENNYPACKER, Samuel Whitaker,

American jurist and author: b. Phoenixville, Pa., 9 April 1843; d. Schwencksville, Pa., 2 Sept. 1917. He received his education at the Grovemont Seminary at Phoenixville and at the West Philadelphia Institute. As a member of the 26th Emergency Pennsylvania regiment he participated in the first engagement at Gettysburg (1863). He then studied law at the University of Pennsylvania and after admission to the bar was elected in 1868 president of the Law Academy of Philadelphia. His legal productions include four volumes of 'Supreme Court Reports,' a volume of 'Colonial Cases,' a 'Digest of the English Common Law Reports' and he also assisted in the publication of 45 volumes of the 'Weekly Notes of Cases.' In 1889 he was appointed judge of the Court of Common Pleas No. 2 and was elected for two terms of 10 years each, acting for five

years as president judge of that court. In 1902 he became governor of Pennsylvania and in that capacity instituted several notable reforms. During his administration a law was passed requiring newspapers to print the names of their owners and editors and making them responsible for negligence; the State constabulary, the health department and the highway department were created and a new capitol building was erected. Governor Pennypacker's session was particularly stormy. He repudiated his party, which opened his administration to violent criticism, and led a war on the easy divorce system of Pennsylvania. Economy and vigor marked his term. He was later president of the Historical Society of Pennsylvania, a trustee of the University of Pennsylvania and held positions of honor in various German and Netherlandish societies. He was author of 'Pennsylvania in American History'; 'Pennsylvania, the Keystone'; 'Settlement of Germantown'; 'Historical and Biographical Sketches'; 'Annals of Phoenixville' and numerous other historical documents. In 1915 he was appointed chairman of the Public Service Commission of Pennsylvania, which office he held until his death.

PENOBSCOT BAY, pē-nōb'skōt, a bay on the southern coast of Maine. It is about 35 miles long and nearly 28 miles wide at its mouth. It is really an estuary, the current of the Penobscot River which flows into it being submerged. The tide waters extend beyond the head of the bay up the river for 20 miles. There are a number of small inlet harbors along the shores and it contains a number of islands, the largest being North Haven, Vinal Haven and Deer Isle.

PENOBSCOT EXPEDITION, in American colonial history the attempt of the Massachusetts Bay colonists in 1779 to dislodge a party of British from the peninsula of Maja-bagaduce, where the city of Castine, Me., now stands. A British force of 700 soldiers had come down from Nova Scotia, seized the peninsula and started to build a fort. It had already become evident that the American colonies were likely to obtain their independence and the fort in Penobscot Bay was intended to establish a northern limit to their territory. A force of 1,500 Americans were sent out from Boston in 19 ships, 13 of which were armed privateers, and three warships of the colony. A combined land and naval attack was planned. The land force debarked and gallantly assaulted the fort, which had been completed on only three sides. Three small British vessels closed the entrance to the harbor and made such a strenuous defense that the commander of the fleet, Captain Saltonstall, refused to attack. After a few days of fruitless action a British fleet appeared on the scene and forced the expeditionary ships to flee up the Penobscot. Three of the ships were captured and nine ships and seven brigs were burned to prevent their falling into the hands of the British. The Americans lost 474 in killed, wounded and prisoners. The losses of the British were 70 in killed, wounded and missing. The remainder of the expedition, including the commanders, made their way across the country to Boston where Captain Saltonstall and General Wadsworth

were publicly censured. General Lovell was acquitted of blame.

PENOBSCOT INDIANS, a North American tribe of the Algonquian family, formerly residing along the both sides of the Penobscot Bay and the Penobscot River, in Maine. They were the most numerous and most influential tribe in the Abnaki Confederation. On the site of the present city of Bangor a chief village was established where the French founded a mission in 1688. The Penobscots took an active part on the side of the French in all the American colonial wars until 1749 when they made a peace treaty with the English. About 250 of these Indians remain, residing at Oldtown, a few miles above Bangor.

PENOBSCOT RIVER, a river in Maine, the headquarters of its western branch being on the northwest boundary of the State, in Somerset County, near the Canada line. It flows eastward into Piscataquis County and passes through Lake Chesuncook, then southeast through Lake Pamedumcook and the Twin Lakes, after which it receives the eastern branch, also known as the Sebouis River, then east to the southwest corner of Aroostook County, where it turns and flows south by west to Penobscot Bay. It receives as its most important tributaries the Mattawaumkeag from the east and the Piscataquis from the west. It is about 350 miles long, the largest river in Maine, and navigable for large steamers for 26 miles from its mouth and for small river steamers for many miles higher up. The river is a swift-flowing stream along its upper and middle course and furnishes water power for many mills. In times past it was a noted salmon stream. The headwaters are in the pine forests and the rough timber is brought down to the mills by floating or rafting. The output of the winter's work in the lumber camps is thus brought to the lumber mills in the spring when the waters, ice-locked for several months, become free. It drains an area of 8,500 square miles. Bangor, at the head of tidal water, is the most important city on its banks. Other towns are Castine, Orrington, Bucksport, Belfast, Frankfort and Prospect.

PENOKEE RANGE, same as Gogebic Range. See IRON ORE DISTRICTS.

PENOLOGY. Penology (from Greek, *ποινη*, penalty or expiation, and *λογος*, theory or science), is the study of punishment for wrongdoing or for crime, both from its deterrent and reformatory aspects. It is often confounded with criminology, the study of crime, and is frequently used as synonymous with it. From a scientific viewpoint the study of penology is the study of the aims for which punishment may be inflicted. Punishment may be deterrent, preventive, retributive or reparative.

Under certain circumstances where the danger to the community is great and the temptation to commit the offense is strong, it is often believed to be necessary to impose punishment which is severe. The offender may, in such cases, be punished without serious consideration being given to his moral guilt or his responsibility. In such a case the culprit suffers for the sake of the community in order that his punishment may deter others from

wrongdoing through the awakening of fear within them.

Punishment may be made preventative by the taking of the culprit's life or by shutting him up within prison walls permanently. The habitual criminal is frequently committed to prison for life. Strictly speaking, if the purpose of society in imposing such sentence is preventive, the word "punishment" is wrongly applied. In such cases society is usually attempting to protect itself and not to make the offender pay for his offense. The third purpose for which punishment is inflicted is to reform the offender himself. This aspect of punishment has been emphasized during this century. This form of punishment demands a radical change in many obsolete methods, including those of the old-fashioned prison with its antiquated administrative practices, equipment and administration. This form of punishment recognizes that the offender must be prepared to return to society through the building up of his physical well-being and of his moral life.

Punishment may be retributive in that it may be made to gratify the feelings of the person injured. Where the victim realizes that the law will swiftly and adequately punish the offender, he is slow to take action contrary to society's law. When on the other hand the victim feels the law will give him no redress, he may take things into his own hands and inflict punishment himself, or take part in its exercise, in accordance with the prompting of the mob mind, as in the case of lynching.

Finally, punishment is reparative when the wrongdoer is detected and punished in such a way as to gratify the disinterested feelings of moral indignation of the public.

In recent years the reformatory aspects of punishment have been emphasized almost to the exclusion of the other aspects because it is now believed that reformatory punishment includes deterrence, prevention, retribution and reparation either as inherent or incidental features. It is the only satisfactory and thorough-going form of punishment. In recent years, therefore, penology has been concerned more about the criminal than with his crime. Its aim is chiefly to make the punishment fit the criminal rather than the crime. Penology usually treats of methods of studying the individual offender in order to study his character. It assumes that he is abnormal; it emphasizes the necessity of discovering all the points of difference between him and the so-called normal man. Penology treats of the methods which may be used to determine the proper classification of the offender so that treatment of him may be based upon careful inquiry. It emphasizes all the different methods or systems of treatment which are calculated if possible to make him normal, that is, to render him capable of associating in free society with "normal" men. In a word, it aims to effect his rehabilitation. Penology also emphasizes and treats of the studies of the offender which should be undertaken in order to discover the causes of delinquency, so that society and government may be taught how to prevent the development of abnormal persons whom we call offenders or criminals. From this point of view penology concerns itself chiefly with preventive meas-

ures and only in a secondary sense with the rehabilitation of the offender.

The study of the individual offender has produced different classes of thinkers. Among the most interesting of these were the so-called "criminologists" led by Lombroso, the great Italian savant, who claimed that they had discovered a criminal type of "instinctive" or "born" criminal, a creature who had come into the world predestined to evil deeds, and who surely could be recognized by certain stigmata—certain physical, even moral birthmarks, the possession of which presumably ineradicable, foredoomed him to the commission of crime. The traits were defined as follows: "Various brain and cerebral anomalies; receding foreheads; massive jaws; prognathous chins; skulls without symmetry; ears long, large and projecting (the ear *ad ansa*); noses rectilinear; wrinkles strongly marked, even in the young and in both sexes; hair abundant on the head, scanty on the cheeks and chin; eyes feline, fixed, cold, glassy, ferocious; bad, repellant faces. Much stress is laid upon the physiognomy; and it is said that it is independent of nationality; two natives of the same country do not so nearly resemble each other as two criminals of different countries. Other peculiarities are: Great width of the extended arms (*l'envergure* of the French); extraordinary ape-like agility; left-handedness as well as ambidexterity; obtuse sense of smell, taste and sometimes of hearing, although the eyesight is superior to that of normal people. 'In general,' to quote Lombroso, 'the born criminal has projecting ears, thick hair and thin beard, projecting frontal eminences, enormous jaws, a square, protruding chin, large cheekbones and frequent gesticulation.' So much for the anatomical and physiological or mental characteristics, so far as they have been observed. Moral insensibility is attributed to him, a dull conscience that never pricks, and a general freedom from remorse. He is said to be generally lacking in intelligence, hence his stupidity, the want of proper precautions both before and after an offense, which leads so often to his detection and capture. His vanity is strongly marked and shown in the pride taken in infamous achievements rather than personal appearance."

Out of this study of the physique and appearance of the individual grew a celebrated system of identification called the Bertillon method, an invention of Alphonse Bertillon, who was born in Paris in 1853, which was adopted by penologists. Later, Sir E. R. Henry adopted the finger print system as a basis for the detection of crime by the identification of the criminal. Measurements of the skull, the cranium, the shape of the forehead, the face, the slant of the eye and the length of the forearm, were for a long time considered fundamental in studies of this sort. Such studies of externals probably reached their climax in the monumental work of Dr. Charles Goring, published in 1913, entitled 'The English Convict,' in which he presents an intensive statistical study of 4,000 male convicts. Dr. Goring gave 12 years to the study of this data. His published work marks the close of an epoch in which penologists placed reliance upon external measurements to discover the character

of the individual offender and the proper classification of the offenders.

The inadequacy of the system was established by Dr. William White in his review of Dr. Goring's book. He said: "Taking the more limited concept of 'thief,' one man may steal under the influence of the prodromal stage of paresis, who has been previously of high moral character; another man may steal under the excitement of a hypodermic attack; another may steal as a result of moral delinquency; another as a result of a high-grade mental defect; and another under the influence of alcoholic intoxication, etc., and so on; and how by any possibility a grouping of these men together can give us any light upon the general concept of 'thief' is beyond my power to comprehend."

In more recent years penology has been profoundly influenced by the development of modern scientific studies in the fields of botany, anthropology, physiology, psychiatry, neurology, pathology and bacteriology. Penology is not a science but is rapidly assuming many of the aspects of science. It has leaned heavily upon all of the sciences and has utilized the methods developed in such diverse fields as are represented by such subjects as education, public health work, sanitation, engineering and architecture.

At the present time the methods for studying the individual adopted by hospitals for the insane have been adopted by penologists not only in studying but also in treating the offender. The monumental study of offenders which is the product of the use of such methods of study is Dr. William Healy's 'The Individual Delinquent,' which strangely enough was published in 1913, the same year that Dr. Goring brought out his monumental work. The adoption of these methods was brought about naturally in a course of years and for several years the penal codes of some of the American States have recognized different degrees of accountability in determining the punishment for crime. Many of them provide that the criminal who is insane is not responsible for his actions, but only very recently has the idea been extended to other forms of insanity such as feeble-mindedness and epilepsy. This broadening of the field of investigation to determine responsibility has led penologists to give attention to hereditary and to environmental factors in determining the criminal's responsibility under the statutory and moral law.

As a preliminary to the study of crime, penology insists upon a study of the individual offender to ascertain: (1) His exact identity; (2) the salient facts concerning his family history; (3) his environment; (4) his criminal record; (5) his mental and physical condition; (6) his attitude toward society; (7) any circumstances which call for leniency or severity in his case.

When these facts have been determined, then the study of penology emphasizes the necessity for classification of the offender so that he may be dealt with intelligently. His case is studied to ascertain: (1) His physical and mental status; (2) his physical and mental age; (3) his character and conduct; (4) the nature and cause of his delinquency; (5) the training he requires to fit him for his return to society.

There are those who are handicapped mentally or physically, or both; there are the inebriates, the habitually idle, the unskilled, the youthful and the aged; there are those who are old in body but children in mind. From the viewpoint of character and conduct, there are the capable and the hopeful, the capable and wilfully delinquent, and the incapable and the unfit. From the standpoint of the nature and cause of the delinquency, there are the casual and environmental and social offenders, the constitutional or habitual offenders and the symptomatic offenders. These latter are interesting cases. They are usually the assassins of our Presidents, the poor derelicts who imagine themselves as rich as Cræsus, the perverts, the degenerates and the parasites.

For the public welfare, and in order that the proper methods and places of treatment may be provided for offenders, penology treats of prisons and institutions and of methods of conducting them so that society may be protected adequately and safeguarded thoroughly, and, further, so that the individual offender may be reformed. Great diversity of treatment is required, which calls for wide differentiation in prison architecture, prison location, prison equipment and prison administration, including discipline.

Institutional government or discipline has imitated but has lagged behind the development of government in the outside world. The different forms of government or discipline may be divided as follows: (1) The autocratic; (2) the benevolent despotic; (3) the mixed autocratic and benevolent despotic; (4) the mixed benevolent and Hamiltonian republican; (5) the Jeffersonian democratic.

In reviewing carefully the development of government and discipline of correctional institutions, more or less pure examples of each of the foregoing types of government are in evidence. In the case of the autocratic form of discipline, which is distinctly a repressive system, the individual is subordinate entirely to the will of the superior government. In this way it is a pure autocracy, modeled after the severest examples of the autocratic state. The benevolent despotic system was carried out by Sir Walter Crofton, director of Irish prisons, from whom it gained its name. Under this system, the superintendent of a prison is a benevolent despot, but his despotism is tempered with both benevolence of purpose and expediency of action. Another development of discipline which has characterized some of our older reformatories and better State prisons was partly autocratic and partly despotic. While to outward appearances the discipline is conducted according to the autocratic system, kindness and cheerfulness so permeate the plan as to provide work and activities which are developmental and reformatory in character. In the case of the so-called mixed benevolent and Hamiltonian republican system, classification and promotion are based on individual effort and self-government is granted as far as possible to that group which is deemed deserving and capable of exercising such control. The Jeffersonian democratic system is the self-government plan of control. It is a system which may be applied in special institutions where the best prisoners are collected, that is, institutions from which the incorrigible, the low grade,

feeble-minded, the degenerate, the seriously abnormal, the insane, the old rounders and the feeble inebriates have been removed.

The best type of prison government is that which is best synchronized with the stage of development with the group of offenders to which it is applied. The aim of penology is to determine the form of government which is best suited to meet the needs of the particular individual under consideration. It emphasizes the necessity for the proper equipment to meet the needs of the particular kind of government which is instituted.

Under the stimulus of the idea of probation, judges were lead to regard institutional treatment as a last resort, as a hopeless refuge of the hopeless offender. More recent studies have demonstrated the inadequacy of such treatment, so that modern penologists insist that the offender shall be carefully studied and his treatment determined in the light of such a study. If his condition demands and warrants release instead of commitment to an institution, then he is recommended for release. If he is in need of hospital treatment or of training, then he is sent to an institution equipped properly to furnish treatment or education, or both.

The penalty as exacted by society in accordance with the teachings of modern penologists is claimed by them to be not less but more severe than the penalty exacted in accordance with the so-called old penology, which attempted to mete out the exact amount of punishment to balance the offense. Under that system, the culprit "paid the penalty" and then was free. Under the more modern system, he is to be deprived of his right to direct himself until such time as he is able and willing to conduct himself normally in accordance with the will of society as it is expressed through government. According to the teachings of this branch of penology, the mere surrender of freedom acts as a more powerful deterrent to the individual than any of the old forms of punishment. Retribution is made to the satisfaction of the victim and of society under a system of treatment through a period of time in such a way as not to offend the better impulses and instincts of any. Under this branch of penology the study of a person being thus punished may also yield results of great value in correcting environmental conditions which are found to be productive of crime.

*Commissioner of Department of Institutions
and Agencies, State of New Jersey.*

PEÑÓN DE CORÓN, pā-nōn' dā kō-rōn', or "**CROWN PEAK**," now known as **CORON ISLAND**, an island of the Calamianes group of the Philippines, lying south of the eastern extremity of Busuanga Island and northeast of Palawan; area, 42 square miles. It is a rocky and precipitous peak 1,200 feet in height, 1½ miles from north to south and six miles across its northern end. The southern end terminates in a sharp, steep point called Calis. The soil is sterile and unfitted for agriculture, and the chief employment of the inhabitants is the gathering of edible birds' nests, composed of the salivary secretions of the swift (q.v.). The birds' nests of Peñón de Corón are of the finest quality and are unrivaled in the market, the Chinese paying double their weight in silver for them. The nests from Coron are nearly always entirely free from foreign substances. On the neighboring islands, also frequented by the swifts, the birds add grass and bits of moss to their nests, which consequently bring much lower prices.

PENROSE, Boies, American lawyer and politician: b. in Philadelphia, 1 Nov. 1860; d. Washington, D. C., 31 Dec. 1921. He was graduated from Harvard College in 1881; read law with Wayne MacVeagh and George Tucker Bispham, and was admitted to the bar in 1883. He then practised his profession in Philadelphia for several years; was a member of the Pennsylvania House of Representatives from the eighth Philadelphia district in 1884-86; and of the Pennsylvania State senate from the sixth Philadelphia district 1887-97, and was president pro tempore of the senate in 1889-91. He was a delegate to the Republican National Conventions of 1900, 1904, 1908 and 1916; was chairman of the Republican State Committee in 1903-05; was a member of the Republican National Committee after 1904 except 1912-16; was elected to the United States Senate, to succeed J. Donald Cameron, for the term beginning 4 March 1897; re-elected in 1903, 1909, 1914 and 1920. For some time prior to his death he was chairman of the Senate Finance Committee and a powerful factor in national politics.

PENSACOLA, pèn-sa-kōla, Fla., city and county-seat of Escambia County, on the

west shore of Pensacola Bay, 10 miles north of the Gulf of Mexico, 48 miles east of Mobile and 204 miles west of Tallahassee. It is on the line of the Louisville and Nashville and the Pensacola, Mobile and New Orleans railroads. The city has an excellent land-locked harbor with from 30 to 33 feet of water on the bar. The climate here is mild and very healthful, the sanitary and quarantine regulations precluding any danger from yellow-fever. The city has gas, electric-light, water and street railway plants. There is a United States navy yard at Warrington seven miles nearer the Gulf and two forts, Pickens and McRee, at the entrance to the harbor, and Fort Barrancas within. The remains still exist of the old Spanish forts of San Bernardo and San Miguel. There is a State armory, Federal government building, opera-house, courthouse and 11 public school buildings. Pensacola is a considerable commercial centre, having a large domestic trade in lumber, fish, naval stores, hides, tallow, cotton, wool, iron, phosphate and coal. There are a commercial fertilizer factory, several cotton presses, sawmills and planing mills. The city has three national and several private banks. Since 1910 extensive developments have been in progress, many large and handsome buildings erected, among them some great hotels; and a series of beautiful parks laid out.

Pensacola Bay was visited in 1528 by the Spanish explorer, Panfilo de Narvaez. The first settlement there was in 1559. The city was first permanently settled in 1696, by a colony of Spaniards from Vera Cruz, Mexico. In 1719 it was captured by the French, but was restored to Spain in 1723. The British secured possession of the town in 1763, but in 1781 it was again captured by the Spanish. In the War of 1812 (q.v.) it was taken by General Jackson. The United States took permanent possession of the city in 1821, in accordance with the treaty of 1819. The navy yard was soon afterward established. Pensacola had a population in 1890 of 11,750 and in 1900 of 17,750. The population in 1910 was 22,982. In 1920, the population according to the United States Census Bureau, was 31,035.

PENSACOLA BAY, an inlet of the Gulf of Mexico in the western part of Florida, extending 25 miles inland and covering about 200 square miles. The northern extension of the bay divides into two parts, West Bay extending up the valley of the Escambia River, and East Bay with two branches extending up the Blackwater and Yellow rivers. It is only one mile wide at the entrance between Santa Rosa Island on the east and the mainland on the west; the bar has 30 to 33 feet of water. Pensacola Bay proper is about 10 miles wide; it is land-locked and affords an excellent harbor. On the western shore, 10 miles from the entrance, is the city of Pensacola. A United States navy yard and naval hospital are at Warrington, also on the west shore and about three miles from the entrance. The bay is defended by Fort Pickens on the Santa Rosa Island and Fort McRee on the outer bar attached to the mainland, and Fort Barrancas on the inner shore of the bay.

PENSACOLA BAY IN THE CIVIL WAR. After the secession ordinance of 10

Jan. 1861, the State authorities seized Fort McRee, Fort Barrancas, north of it, and the navy yard on the west shore, and demanded the surrender of Fort Pickens, located on Santa Rosa Island to the east of the entrance to the bay. But it was resolutely held by Lieut. A. J. Slemmer and a small body of United States regulars, which soon were reinforced by a detachment of Wilson's Zouaves of New York and a small blockading squadron. The garrison and marines made night raids on the navy yard, on 2 September burning the dry dock, and on the 13th burning a vessel fitting out as a privateer. The Confederates in turn attempted to surprise and capture Wilson's troops. For this purpose an expedition of 1,000 men under Gen. R. H. Anderson crossed over to Santa Rosa Island and landed several miles east of Fort Pickens. It was the early morning of 9 October. Anderson divided his force into three battalions, one 260 strong under Col. John K. Jackson, the rest about evenly divided under Cols. James Chalmers and J. Patton Anderson respectively.

After a march of three or four miles, the shooting of a sentinel by some one of Chalmers' command gave the alarm to the Federal camp. Jackson's battalion of Georgians then pushed through thickets to the middle of the island, driving the Federal outposts before them and stormed the camp, which they found deserted. Here they burned the storehouses and sheds. As daylight came before arrangements could be made for further concerted action, General Anderson ordered all back to the boats. During the withdrawal a sharp skirmish occurred with two companies of Federals that attempted to intercept the retreat. While the troops were embarking, an unavoidable delay enabled the Federals to come up and open fire, by which several Confederates were killed or wounded. The total Confederate loss in this affair was officially stated as 18 killed, 39 wounded and 30 captured. The total Union loss reported was 64.

PENSÉES. Pascal's 'Pensées,' or 'Thoughts,' have been called the greatest masterpiece in French prose. Yet the work is incomplete, even fragmentary, and it is impossible to say what was in detail the author's proposed argument. Pascal had long planned a great work on religion which should express from his point of view its defense or justification. The period was one of great religious turmoil, characterized not only by the disputes of the Jesuits and the Jansenists, but also by what was considered the subtly corroding influence of the worldly indifferentists or unbelievers, known as "libertines." It was to a considerable degree against these last that Pascal's projected work was directed. He also wished to refute the scientists who, in his opinion, allowed too much power to the freedom of lay and independent rationalism. He had all the ardor of the new convert, and only illness and early death prevented him from completing this great apology of his faith.

There were many difficulties in the way of posthumous publication. Pascal's nephew brought out the first edition in 1670, in which the material was somewhat arbitrarily arranged. For over a century this remained the standard version, but now it is possible to read the 'Pensées' both in reprints of the disorderly

primitive manuscripts and in new systematic classifications more suited to modern readers.

Pascal was influenced in the composition of the 'Pensées' by such works as the Bible and the writings of Jansenius, as well as by lay authors like the sceptical moralists, Epictetus and Montaigne, whose arguments Pascal used to justify his own progress from scepticism to faith.

The underlying concept of Pascal in the 'Pensées' is that man stands in the midst of nature apparently a helpless victim of cruel and ruthless forces. Yet he has an inward conviction that there must be some motive for this state of things. We get consolation and even comfort if we are willing to believe that our suffering expiates the sin of our first parents' wrongdoing. This conviction is reached, not merely by cold reasoning but by an inner feeling or intuition, and it throws us headlong and lovingly into the arms of faith.

To-day so many of Pascal's thoughts have become familiar by frequent repetition and have so entered into the commonplaces of literature that we find it difficult to realize their profundity and novelty in his own day. Some passages extend over several pages, some are mere unfinished scraps, some, indeed, occur in duplicate or triple form, but they are full of personal and religious feeling expressed in lyric prose. Therefore, however little some persons may sympathize with what they consider the morbid and neurotic sensitiveness of Pascal, none the less he has an irresistible appeal to many. At no time has he been more studied than now when the reaction against the scientific, materialistic rationalism of the 19th century has led many philosophers to draw parallels between their religious position and that of Pascal.

Important modern editions of the 'Pensées' are those of L. Brunschvig (two editions, 1897 and 1904, small and large), with a reclassification of the text; Michaut, G. (1896), a reprint of the manuscript; Gazier, A. (1907), a reprint of the text of the first edition. Consult also other editions by Havet and Fougère.

CHARLES H. C. WRIGHT.

PENSIONS. A pension is in its essence a gratuity, and as such is to be sharply distinguished from any form of insurance, to which the beneficiary contributes. The idea has been advanced that a pension is to be considered a deferred payment of salary—on the understanding that the salary had been an inequitable compensation. The courts have not sustained this view but have ruled that there is no inherent right of the pensioner to the pension, but that it is charity pure and simple. In its specific form, however, it is generally recognized as being a reward for continuity of service—a protection extended to a faithful employee when he is no longer able to remain effectively at his post as in the case of civil service and police pensions; or as a tangible recognition of a valuable service rendered to the state, as in the case of maternity pensions and military pensions.

The several systems of pensions which have been developed from charitable and socialistic investigations may be grouped largely into two classes: public and private. The former includes (1) old age pensions; (2) invalid or disability pensions; (3) maternity pensions;

(4) widows' or mothers' pensions; (5) civil service pensions; (6) municipal pensions; (7) military pensions; (8) teachers' pensions. The latter includes various systems of pensioning retired clergymen and college professors, and the industrial or employees' pensions of private concerns. All systems which are based in whole or in part, directly or indirectly, upon voluntary or compulsory contributions by the beneficiaries belong properly to the domain of insurance (q.v.).

Old Age Pensions.—The idea of the old age pension system is to do away with the wholly unsatisfactory almshouse as the ultimate refuge of the dependent aged by providing them with means of retaining their own individual homes. The basic principle of such pensions is well set forth in the preamble to the New Zealand Pension Act, thus: "It is equitable that deserving persons who, during the prime of life, have helped to bear the public burdens of the Colony by payment of taxes, and to open up its resources by their labor and skill should receive from the Colony a pension in their old age." The pension under the New Zealand law, which may be instanced as typical, and the most generous of all, is up to a maximum of \$2.50 per week, or \$130 a year. It is payable to all persons except Chinese and other Asiatics, and civil service employees (otherwise provided for) reaching 65 years of age and who have been residents of the colony for 25 years, and who have for the five years immediately preceding application lived a sober and reputable life; whose income does not exceed \$250 a year, and whose accumulated property does not exceed \$1,300. Under these conditions about one-third of the persons of 65 years of age and over in the colony are recipients of pensions.

In Australia similar laws are in force for men of 65 and women of 60, if of 20 years' residence. In Victoria, however, there is a condition that no pension shall be given to such persons as are physically able to earn their living. In New South Wales a graduated pension is paid, the maximum of \$130 per annum to a pensioner whose income does not exceed \$130 per annum, and decreasing as the private income increases, so that those who receive privately \$260 per annum are not entitled to any pension. The pension is also reduced by another scale based on the value of personal property owned by the applicant. Any one owning \$1,950 in property, although without a stated income, is not entitled to draw a pension.

By the revised (1908) Pension Act of Great Britain a pensioner must be at least 70 years old, and have been a British subject for at least 20 years. His yearly income must not exceed \$156. The pension is scaled according to the private income and ranges from a minimum of 24 cents up to a maximum of \$1.20 a week, the aggregate of the income and pension not to exceed \$3.12 per week.

In the United States two unproductive attempts have been made within recent years to establish an old age pension system. The Wilson bill (61st Cong. 2d sess., H. R. No. 14494) introduced 14 Dec. 1909, proposed the organization of all persons of 65 years upward into the "Old Age Home Guard of the United States Army"; enlisting both men and women who had been residents of the United States

for 25 years, and citizens for 15 years, and who were possessed of less than \$1,500 of property, and with an income of less than \$240 per annum. The "pay" of "privates" in this army was to be \$120 per annum, subject to certain deductions in case of a private income larger than \$300 per year. The Berger bill (62d Cong. 1st sess. H. R. No. 13144) introduced 31 July 1911, aimed to provide a pension for all persons reaching 60 years of age, and having been citizens of the United States for 16 years; and whose average income for the previous year had not been more than \$6 a week. The pension in such case was to be \$4 a week. In case of a larger private income the pension should be reduced accordingly, so that the aggregate of income and pension should not exceed \$10 per week. In the case of a married couple not legally separated, and both of pension age and circumstances, the pension of each should be three-fourths of the standard pension for a single person.

In Canada a government annuity system takes the place of an old age pension. In France and Germany the pensioner is required to contribute during his productive years, the government and the employer each contributing also to the pension fund. This is actually old age insurance.

Invalid Pensions.—A disability or invalid pension is one granted to a person permanently disabled by disease or injury. The invalid pension system of Australia is typical, and is the best purely gratuitous system so far developed. The applicant must have attained the age of 16 years, and have been continuously a resident for at least five years. He (or she) must be permanently incapacitated for work and have been incapacitated while in Australia. The rate of the pension is fixed by the commissioner or one of his deputies, and must not exceed \$130 per annum; and the aggregate income of the pensioner, including the pension, must not be over \$260 per annum. Australia began to pay invalid pensions 15 Dec. 1910. On 30 June 1917 there were 26,781 of these pensions current, 157 of these being paid to persons of 16 years of age, of whom 76 were males and 81 females. Of the whole number, 93.6 per cent received the maximum pension of \$6.25 every fortnight. During the year 5,142 pensions had been granted, 2,729 to males and 2,413 to females. The fortnightly expenditure amounted to \$164,475.

In Great Britain the old age pensions are made to apply to persons incapacitated at an age below the standard age at which applications may be made. There is also a similar provision in the Civil Service Pension Law.

In the United States "invalid pensions" are paid to men in the military service who are disabled by wounds or by disease contracted while in the service. These pensions are distinguished only in classification from the regular military "service pension."

Maternity Pensions.—The maternity pension is one given to a woman at and for a time following the birth of her child. It is considered a better provision than the medical and surgical advice given gratuitously in some countries. It may be given as a lump sum, or in a series of weekly payments continuing from 2 to 12 weeks, and in some cases begin-

ning two weeks before the birth. In Great Britain and Australia it is paid in one specified sum. In Switzerland and France it is a serial payment running from 4 to 12 weeks, or during the "nursing" period. By the Netherlands law of 1913 and the German law of 1915 the aid is given for three months after the birth. In some other countries, as Rumania and Denmark, the mother is required to contribute the whole fund from her wages, to be paid back to her when her child is born. In most countries a provision for aid at maternity is a part of the scheme of health insurance, and hence not a pension.

Widow's Pensions, called in some localities "mothers' pensions," are intended to provide a widowed mother, or one divorced or deserted, with the means necessary to keep her family together, and to bring up her children at least to the age of 16 years. In some States the "mothers' pension" is granted to the mother when the father is incapacitated for work. The term is doubtless a misnomer, the expressed intent being care of the children, and "children's pension" would more accurately describe the gratuity. The usual requirements are that the child shall live with the mother; that the mother is a proper person physically and mentally to bring up the child; and that except for the pension the child would have to be sent for support to a public institution. The first widows' pension law in the United States was passed by the Missouri legislature in 1911. It was general in character, but by its limitations as to population, it applied only to Kansas City. In the same year Illinois passed a broader law. The idea has spread rapidly and at the close of 1917 31 States had adopted it, and a provision of some kind for widows with dependent children had been incorporated into their statutes. These States are Arizona, California, Colorado, Florida, Idaho, Illinois, Iowa, Kansas, Maine, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New York, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, South Dakota, Tennessee, Texas, Utah, Washington, Wisconsin and Wyoming. A comprehensive digest of these various State laws may be found in the editions of 'The World Almanac.'

Civil Service Pensions are those granted to employees of the State upon their superannuation, or, in some cases, on the abolition of an office which had been adequately and faithfully administered by the displaced official. It is commonly graduated upon a basis of continuous service for a certain minimum period. In the English law the pensioner must have served at least 10 years and be over 60 years when retired, or, if under 60 he must be certified as permanently incapable of discharging his official duties. The pension is figured on a basis of 1/80 of his former salary for each year of service, not to exceed in all 40/80. There is also a provision for a graduated bonus in addition, based on the length of service, but this forms no part of the pension.

In the United States the only civil service pensions are those granted to Federal judges, who may retire after 70 years of age. The pension is equal to the salary where the length of service has been 10 years or more. Eight

of the States similarly pension their retired judges.

Municipal Pensions.—In the United States the only municipal pension systems are for the police and firemen, the principle involved being that the men constituting these forces are often called upon to risk their lives or their health for the benefit of the community which they serve. The city of Rochester, N. Y., also pensions the widows and children of policemen or firemen who lose their lives in the discharge of their duty, and of those who are incapacitated while on duty. Some 300 American cities have municipal pension systems, but in some of them the fund is in part contributed by the members of the force on a fraternal insurance plan. In the principal European cities the pension is wholly gratuitous, and is equal to the former salary. In the United States the retirement pension is generally half the former salary.

Military Pensions are those granted to soldiers and sailors of the army and navy, for service of the State under hazard. In the United States, pension legislation was first enacted by the different States, for the relief of those who were wounded or disabled in service during the War of the Revolution, but in 1789 by an act of Congress the general government assumed the payment of such pensions as had been granted by the States, and this provision was continued by subsequent legislation. Later on, pensions were granted to the widows of Revolutionary soldiers, and in 1861 the pension rolls contained the names of 63 survivors of that war and 2,728 widows of Revolutionary soldiers. The last survivor was Daniel F. Bakeman, of Freedom, Cattaraugus County, N. Y., who died 5 April 1869, aged 109 years six months and eight days. On 30 June 1910 the rolls still contained the name of one daughter of a Revolutionary soldier, the daughters having been pensioned by special acts of Congress. The amount disbursed to Revolutionary pensioners up to 30 June 1916 was approximately \$70,000,000.

War of 1812.—On 14 Feb. 1871 an act was passed by Congress granting a pension of \$8 per month to the survivors of the War of 1812 who rendered a service of 60 days, and to their widows provided they were married to such soldiers or sailors prior to the treaty of peace 17 Feb. 1815. The act of 9 March 1878 reduced the period of service to 14 days, and made no limitation as to date of marriage in case of widows. By subsequent legislation the pension to widows was increased to \$12 per month. On 30 June 1916 the pensioners of the War of 1812 were 115 widows. The amount disbursed under said acts up to 30 June 1916 was \$45,991,744.

Indian Wars.—On 27 July 1892 Congress enacted a law granting pensions to those who served 30 days in the Black Hawk, Creek, Cherokee and Florida War with Seminole Indians from 1832 to 1842 and to their widows. On 27 June 1902 the benefits of this act were extended to the survivors of the Florida and Georgia Seminole Indian War of 1817-18; the Fevre River Indian War of Illinois of 1827; the Sac and Fox Indian War of 1831; the Sabine Indian disturbances of 1836 and 1837; the Cayuse Indian War of 1847-48 on the Pacific Coast; the Florida wars with the Seminole In-

dians from 1842 to 1858; the Texas and New Mexico Indian War of 1849-56; the California Indian disturbances of 1851-52; the Utah Indian disturbances of 1850-53, and the Oregon and Washington Territory Indian wars from 1851 to 1856, and to their surviving widows. The pension is fixed at \$8 per month. The number of pensioners on the rolls under these acts on 30 June 1916 was 2,578, consisting of 676 survivors and 1,902 widows; the amount disbursed thereunder up to said date was \$13,790,299.

Mexican War.—By an act of 29 Jan. 1887 Congress granted a pension of \$8 per month to the surviving soldiers and sailors of the war with Mexico, provided that they actually served 60 days with the army or navy of the United States in Mexico, or on the coasts or frontier thereof, or en route thereto, in the war with that nation, or were actually engaged in a battle in that war, and were honorably discharged; and to such officers and soldiers and sailors as may have been personally named in any resolution of Congress for any specific service in the war; and to the surviving widows of such officers and enlisted men. The conditions under which title is granted under the act are that the soldier or sailor must be 62 years of age, or if under that age he must be disabled from causes not incurred while in any manner voluntarily engaged in or aiding or abetting the late rebellion against the authority of the United States. The provisions of this act were subsequently extended to Powell's Battalion of Missouri Mounted Volunteers and to Gray's Battalion of Arkansas Volunteers, and by the act of 3 March 1903 the pension to survivors was fixed at \$12 per month. Widows of officers and enlisted men who served as above stated are entitled to pension on the same conditions as to age, disability or dependence, as apply to such officer or soldier, but their pension is not subject to increase, nor are the descendants of survivors entitled to pension under those acts. The number of Mexican War pensioners on 30 June 1916 was 4,298, consisting of 513 survivors and 3,785 widows, and the total payments to them on that date had amounted to \$50,422,229.

Civil War.—There are two distinct systems of pensioning on account of service in the Civil War. Under the acts of 14 July 1862 and 3 March 1873 any officer, soldier, sailor or marine, disabled by reason of wound or injury received or disease contracted in the service of the United States, and in the line of duty, may be pensioned for such disability during its continuance. In case of his death from causes originating as above set forth, his widow or his child or children under 16 years of age become entitled to pension. If he left no widow, or child under 16, his dependent mother, father, or orphan sisters and brothers are entitled in the order named.

Under the acts of 27 June 1890 and 9 May 1900 any officer, soldier, sailor or marine who served 90 days or more in the military or naval service of the United States during the war of the Rebellion, who had been honorably discharged therefrom, and who was suffering from disability of a permanent character, not the result of his own vicious habits, which incapacitated him from the performance of manual labor in such a degree as to render him

unable to earn a support, was entitled to pension under these acts of not less than \$6 per month nor more than \$12 per month.

In case of the death of any person named above, his widow becomes entitled to pension, provided she married him prior to 27 June 1890, and that she is without other means of support than her daily labor. If she remarries or dies, the child or children of such soldier or sailor under the age of 16 years become entitled. The act of 9 May 1900, which is an amendment of the act of 27 June 1890, provided that in determining inability to earn a support each and every infirmity shall be duly considered, and the aggregate of the disabilities shown be rated. It is also provided that a widow may have title to pension if she is left without means of support other than her daily labor and an actual net income not exceeding \$250 per year. On 30 June 1916 there were 362,277 invalid pensioners of the Civil War and 286,080 widows, minor children and dependent relatives. The amount of money paid to pensioners of the Civil War up to 30 June 1916 was \$4,765,075,021. The rates of pensions to invalids under the general law range from \$6 per month to \$100 per month, there being various intermediate rates for different degrees of disability. The rates of pensions to widows and dependents range from \$8 per month to \$30 per month and are governed by the rank held by the husband on the date his fatal disease was incurred in the service. In 1918 an amendment was made to the General Pension Act of 11 May 1912, reading: "From and after the passage of this act the rate of pension for any person who served ninety days or more in the military or naval service of the United States during the Civil War, now on the roll or hereafter to be placed on the pension roll and entitled to receive a less rate than hereinafter provided, shall be \$30 per month. In case such a person has reached the age of seventy-two years and served six months, the rate shall be \$32 per month; one year, \$35 per month; one and a half years, \$38 per month; two years or over, \$40 per month: Provided 'That this act shall not be so construed as to reduce any pension under any act, public or private.'"

The Supreme Court of the United States has decided that "no pensioner has a vested legal right to his pension. Pensions are the bounties of the government, which Congress has the right to give, distribute, or recall at its discretion."

An act of Congress, approved 21 Dec. 1893, provides, however, that a pension shall be deemed and held by all officers of the United States to be a vested right in the grantee to that extent that payment thereof shall not be withheld or suspended until after due notice to the grantee of not less than 30 days, the Commissioner of Pensions shall decide to annul, vacate, modify and set aside the decision upon which such pension was granted.

Laws have been enacted from time to time for the purpose of protecting pensioners from any diversion of their pensions either by their own acts or by the acts of others. Any pledge, mortgage, sale, assignment or transfer of any right, claim or interest in any pension shall be void and of no effect. The holding of a pension certificate as collateral security for any

debt or promise, or the retention of a certificate and refusal to surrender it upon proper demand, are misdemeanors, and punishable by heavy fine, upon conviction.

War with Spain and Insurrection in the Philippine Islands.—The provisions of the acts of 14 July 1862 and 3 March 1873 apply to those who served in the war with Spain and the insurrection in the Philippine Islands, and up to 30 June 1916, 28,472, including invalids, widows and dependents, had been pensioned on account of such service, and 1,164 special pensions had been granted. The amount disbursed to them was \$53,744,668. An act of 1918 provides for widows and minor children of officers and enlisted men who served 90 days or more in the War with Spain, the Philippine insurrection, or in China. The law grants a widow without means of support other than her daily labor and an actual net income not exceeding \$250 per year, \$12 per month during widowhood, and \$2 per month for each child under 16, until 16 unless insane, idiotic or otherwise permanently incapable. For the comprehensive scheme of insurance, allotments, pensions, etc., in the War of 1914-18 see **WAR RISK INSURANCE**.

Regular Establishment.—The acts of 14 July 1862 and 3 March 1873 also apply to those who have served in the army and navy in time of peace since 4 March 1861, and to those who are now in the military or naval service. The number of pensioners on the roll of the regular establishment on 30 June 1916 were distributed as follows: invalids, 15,553; widows, 2,937; minor children, 221; dependent mothers, 1,208; dependent fathers, 169; brothers, sisters, sons and daughters, 6; helpless children, 8; a total of 20,102. The total amount disbursed to 30 June 1916 in this classification was \$39,098,319.

Army Nurses.—Under the act of 5 Aug. 1892 all women employed by the surgeon-general of the army as nurses, under contract or otherwise, during the late War of the Rebellion for a period of six months or more, and who were honorably relieved from such service, are granted a pension of \$12 per month, provided they are unable to earn a support. On 30 June 1916 the pension rolls bore the names of 252 pensioners under this act.

Total Disbursements for Pensions.—From 1 July 1790 to 30 June 1865, a period of 75 years, the disbursement for pensions amounted to \$96,445,444.23. From 1 July 1865 to 30 June 1916 the disbursements for the payment of pensions were \$4,993,114,894, making the actual total disbursements in pensions since the beginning of the government \$5,089,560,338. Adding to this amount the cost of maintenance, namely, \$131,375,055, it will be seen that the pension system since the foundation of the government has cost \$5,220,935,393, which sum is exclusive of the establishment of soldiers' homes.

Number of Soldiers and Sailors of the Various Wars.—Revolutionary War, 184,038; War of 1812, 286,730; Mexican War, 78,718; Indian wars, 83,993; Civil War, 2,213,363; Spanish War, 312,000; Philippines and China, 146,151; total 3,304,993. The average pension paid to each enlistment has been \$919.

Pension Agencies.—Pensions are paid quarterly through the 18 pension agencies located in different parts of the country. The President is authorized by law to establish agencies for the payment of pensions, wherever,

in his judgment, the public interests and the convenience of the pensioners require. Pension agents are appointed by the President by and with the advice and consent of the Senate, and they are required to give bond, with good and sufficient sureties, for such amount and in such form as the Secretary of the Interior may approve.

Teachers' Pensions.—In the United States only five States have granted State-wide gratuitous pensions to teachers. They are Arizona (1912); Maine (1913); Maryland (1902); New Hampshire (1915); and Rhode Island (1907). In Maryland, the pension begins after 25 years of service, and the amount is \$200 a year; in Rhode Island the pension begins after 35 years of service and the amount is half of the average annual salary for the five years next preceding; but must not exceed \$500 per year. New Jersey has two pension laws; the one in force previous to January 1908, and applicable only to teachers in service previous to that date is in terms the same as that of Rhode Island. The other law provides for teachers' compulsory contributions. Virginia makes annual contributions of State funds to the pension fund, but requires a contribution from teachers of 1 per cent of their salaries. Massachusetts permits all cities except Boston to pension their teachers if the people so decide at the polls. Boston has a small private fund of its own. Alabama in 1915 passed a pension law permitting the pensioning of teachers in communities of more than 80,000 and less than 82,000 population. These figures limited the application of the law to Mobile County.

In Europe nearly all countries have teachers' pension laws in operation. Russia's law dates from 1819; England's from 1848; France's from 1858. Other countries in which such laws are in force are Australia, Austria, Belgium, Finland, Ireland, Japan, Norway, Serbia, Spain, Sweden and Switzerland. In South America, the Argentine Republic and Chile have most generous teachers' pension laws. In Canada the provinces of Ontario and Quebec must be included in the list. In Mexico, also there is a non-contributory provision for retired teachers.

Among the private pension systems are many for retired teachers from famous schools, notably in England. The other classes of private pensions as noted above are as follows:

Clergymen's Pensions.—These are paid from the private funds of the church organizations in which the pensioner has been active. In England where the Church is a state institution the pension is called "Ecclesiastical," and under the peculiar conditions is a public pension.

Collegiate Pensions.—The principal provision for the pensioning of college professors is "The Carnegie Foundation for the Advancement of Teaching." This organization was incorporated by an act of Congress and approved by the President 10 March 1906, with the avowed purpose of providing retiring pensions "for the teachers of universities, colleges, and technical schools in the United States, Canada and Newfoundland, who are in need of the aid, and who have not served in sectarian institutions." It is a duty of the administrators to approve the institution from which the applicant comes as one of college grade. There is

an age limit of 65 years, and 15 years of service, but the rules are not rigid, each case being judged on its merits. Provision is also made for the widows of pensioners. The "retiring allowance" as the pension is termed is not to exceed 80 per cent of the salary previously received and in any case cannot exceed \$4,000. The average pension has been about \$1,600. The number of pensioners is about 350 and the annual expenditure about \$550,000.

Industrial Pensions.—The effect of the pensions granted to the employees of the larger industrial concerns has been to ensure the continuance of experienced men in their service. It is thus a benefit to the employer as well as the employee, and experience has shown that the system can be carried at an expense of only 1 per cent of the wage scale. In some of the establishments where the system has been introduced, the employees have been asked to contribute half of the expense, but in the large majority of cases the pension is wholly gratuitous. The American Express Company's plan is typical. It is in amount half of the average salary for the preceding 10 years, and is paid to an employee for not less than 20 years' service when he becomes incapacitated through age or injury while in the company's service. Other industrial concerns who provide pensions for their aged employees are the E. I. du Pont de Nemours Powder Company, the Gorham Manufacturing Company, the International Harvester Company, the Philadelphia Electric Company, the Public Service Corporation of New Jersey, the Standard Oil Company, the United States Steel Corporation, Wells, Fargo and Company, and the Westinghouse Air Brake Company. The Armour Company and Morris and Company are conspicuously in opposition to the gratuitous pension. They require a 3 per cent contribution to the pension fund from all their employees except unmarried women.

Nearly all the transportation companies retire their long-service employees with pensions, at 60 years if they ask it, and at 65 years under compulsion. The system adopted by most railroads is on a basis of 1 per cent of the average monthly pay received for the preceding 10 years, multiplied by the number of years in the company's service. The pensions are granted also to men permanently incapacitated while in the company's service without regard to age. (See ANNUITIES; PAUPERISM). Consult Squier, L. W., 'Old Age Dependency in the United States' (New York 1912); and annual reports of the Bureau of Labor and of the Commissioner of Pensions.

PENTACLE. See PENTAGON.

PENTACRINUS. See CRINOID.

PENTATEUCH, pen'tā-tūk'. The Hebrew Old Testament consists of three parts, *Law*, *Prophets* and *Writings*. The first of these, containing five books sometimes called the *Five Books of Moses*, is called *Tōrah* or *Law*, because it embodies practically the entire legal system of the Hebrews. The five-fold division goes back to very early times, for the early rabbis speak of the *five fifths of the Law*, while the Early Church fathers, beginning with Tertullian, employ the term *Pentateuch*, which is still in common use among Christians. *Pentateuchos* means "five-roll," that is, the five-roll book. Primarily, the word *teuchos* denotes

the box or chest in which the roll was kept, but in the course of time it came to be used of the roll itself. The five-fold division coincides with the contents. Genesis clearly forms a book by itself, and so does Deuteronomy; Leviticus has characteristics of its own, which separates it from the books on either side. This leaves Exodus and Numbers, the opening words of the former (Ex. i, 1-7) and the closing words of the latter (Num. xxxvi, 13), showing that each is considered complete in itself. In this article only subjects dealing with the Pentateuch as a whole are considered. See articles *GENESIS*; *EXODUS*; *LEVITICUS*; *NUMBERS*; *DEUTERONOMY*.

2. The Hexateuch.—Modern scholars add to the first five books the book of Joshua, which results in a six-roll book, or a *Hexateuch*. Joshua is joined to the others because "its contents, and still more, its literary structure, show that it is intimately connected with the Pentateuch and describes the final stage in the history of the *Origines* of the Hebrew nation." The reason for separating Joshua from the Torah appears to be twofold: (1) Moses could not be connected with the Joshua material as its author, and (2) the contents prevented its setting apart with the books of the Pentateuch as an authoritative guide of life. (Much of what is said in this article, though referring primarily to the Pentateuch, applies also to the Hexateuch).

3. General Contents.—Though there is great variety of contents, all the material may be arranged under two heads: (1) *History*: The historical portions of the Hexateuch cover the period beginning with the creation of the world and ending with the settlement of the Israelite tribes in Canaan. This period may be divided into three epochs: (a) The beginning of all things (Gen. i, 1-xi, 9); (b) The Hebrew Patriarchs (Gen. xi, 10-l, 26); (c) The organization of Israel into a more or less compact national unit and its settlement in Canaan (the historical sections of Exodus, Leviticus, Numbers, Deuteronomy and Joshua). No attempt is made to furnish a complete history, for many important details are treated very briefly or passed over entirely; nevertheless, the stream of narrative is never wholly interrupted, and though at times it is almost lost sight of, it always reappears and flows on to the end. (2) *Law*: The legal sections of the Pentateuch are so extensive that, as has been stated, the whole group is known as the *Tôrâh*, which means law. The book of Leviticus consists entirely of legal material; two others, Exodus and Numbers, are a mixture of law and history; Deuteronomy is made up largely of addresses embodying laws; and even Genesis, which is almost entirely narrative, mentions the laws of marriage and of the Sabbath as given in primæval times, introduces regulations concerning food said to have been given in the days of Noah, and relates the institution of circumcision in the days of Abraham.

4. History of the Pentateuchal Criticism.—In the latest portions of the Old Testament it seems to be assumed that the *Law* or *Tôrâh* is the work of Moses (2 Chron. xxxiv, 14; Ezra iii, 2; vii, 6) but it may well be that these passages refer only to the legal system of the Hebrews embodied in the Pentateuch, and not

to the book as a whole. However, whatever the significance of these Old Testament references may be, Philo of Alexandria (*Vita Mosis*, iii, 39) and Josephus (*Contra Ap.*, i, 18; *Ant.* iv, 8-48) proceed on the assumption that Moses wrote the entire Pentateuch and the same seems to be true of some of the New Testament writers. The Babylonian Talmud (*Baba bathra*, 14b) states definitely: "Moses wrote his own book, the section about Balaam and Job." Only the last eight verses of Deuteronomy are ascribed to Joshua, on the reasonable assumption that Moses could hardly have written in his lifetime an account of his own death in the words: "And he died there" (Deut. xxxiv, 5). Nevertheless, according to the Gemara exposition of this passage at least one rabbi insisted that even the closing verses were written by Moses "with weeping."

The view that Moses wrote the entire Pentateuch maintained itself without very serious opposition until the time of the Reformation. The objectors were few, and they exerted little influence (for instance, Isaac ben Jason in the 10th or 11th century, and Ibn Ezra in the 12th). The Renaissance and the Reformation mark a new epoch in Biblical criticism; and some of the men prominent in the Reformation movement, like Karlstadt and Luther, anticipated some of the conclusions of modern scholars. The learned Catholic Masius also suggested that the Pentateuch may have received its final form from Ezra or some other man of God.

The general church, both Protestant and Catholic, did not adopt the liberal attitude of these leaders, but continued to regard belief in the Mosaic authorship of the Pentateuch an essential article of faith. But there continued to be protests against this view. Among the objectors the outstanding men were Spinoza, Hobbes, Peynerius, Simon, Clericus; but they were vigorously opposed by numerous representatives of the Church. The permanent value of the discussions published during the 17th and the early years of the 18th century lies not in the theories proposed but in their insistence upon the facts and the demand for an adequate explanation of the facts.

Jean Astruc, physician of Louis XIV, and professor of medicine in Paris, gave new direction to critical theories ("Conjectures sur les mémoires originaux dont il paroît que Moïse s'est servi pour composer le livre de la Genèse," Brussels 1753). Following out suggestions made by earlier writers Astruc maintained that in the composition of Genesis, Moses used several sources which he incorporated in his work practically without alterations. Noticing further that in some sections of Genesis the divine name *Elohim* was used, and in others *Yahweh* he proceeded, on the basis of this peculiarity, to analyze the book into two principal sources, the Elohist and the Yahwistic or Jehovistic—admitting, however, the presence of 9 or 10 additional minor sources, of which only fragments were preserved. Astruc did not deny the Mosaic authorship of Genesis or of the rest of the Pentateuch; his view was that Moses compiled Genesis from the older sources, and then wrote the remaining four books.

During the latter part of the 18th and during the 19th century Eichhorn, Ilgen, De Wette, Bleek, Ewald, Hupfeld, Graf, Kuenen, Well-

hausen and others labored diligently on the problem, until Pentateuchal criticism became established upon a firm, scientific basis. In the course of these investigations various theories have been proposed to account for the complicated facts discovered in the Pentateuch: (1) *The Fragment Theory*, which regarded the Pentateuch as "an agglomeration of longer and shorter fragments, between which no threads of continuous connection could be traced." The arguments in support of the theory were drawn chiefly from the middle books of the Pentateuch, where the transitions are frequently very abrupt. (2) *The Supplement Theory*, originated in the better appreciation of the common plan and purpose running throughout the Pentateuch. According to that theory in its simplest form, the Elohist part was the oldest portion and served as groundwork for the whole. It was revised by a later editor, the Yahwist or Jehovist, who annotated the older work throughout and added to it a considerable number of new and independent sections. Deuteronomy was thought to be the latest addition. (3) *The Document Theory*. The discovery by Hupfeld in 1853 of a second Elohim source necessitated a modification of the Supplement Theory. Moreover, a closer study of the interrelation of the different layers in the Pentateuch showed that theory to be inadequate. Its place was taken by what is generally known as the Document Theory, because it considers the Pentateuch in its present form to be the result of the compilation of material coming from at least four documents, each of which is thought to have had originally an independent existence. The earlier advocates of the Document Theory used a variety of symbols to designate the different sources, but at present the four documents are generally known as J—the Jehovistic document, that is, the document characterized by the use of the divine name "Jehovah" or "Yahweh" in the sections narrating events preceding the call of Moses; E—the Elohist document, that is, the document using the divine name "Elohim" in the corresponding sections; D—the Deuteronomistic Code, furnishing the heart of the book of Deuteronomy; P—the Priestly Code, a document combining history and law, written from a distinctively priestly standpoint. All four documents are thought to embody older sources which had an independent existence either in written or oral form.

The Document Theory is the prevailing theory at the present time; but in the course of its history it has passed through various modifications. The form in which it is most widely accepted among scholars to-day is known as the *Graf-Wellhausen Theory*, or the *Development Theory*. The earliest exponent of this view was E. Reuss, who as early as 1833 or 1834, in his lectures at the University of Strassburg, called attention to the fact that the history of Israel as outlined in Judges, Samuel and Kings contained much that seemed to conflict with the theory that the laws of the Pentateuch were in force among the people during the centuries described in those books. He further maintained that the Pentateuchal legal system was utterly unknown to the prophets of the 8th and 7th centuries, that Jeremiah was the first prophet who shows acquaintance with a written law and that his quotations are ex-

clusively from Deuteronomy. This book, or at least its central portion (iv, 45–xxviii, 68), he thought to have been the book found in the temple in the days of Josiah, and he looked upon that code as the most ancient part of the codified legislation contained in the Pentateuch. Ezekiel he believed to have lived prior to the redaction of the ritual code and of the laws which were formulated by the hierarchy. The views of Reuss were not published until 1879. Meanwhile a former pupil of Reuss, K. H. Graf, had published similar views, which were further developed by A. Kayser, A. Kuenen and most brilliantly of all, by Julius Wellhausen. According to these scholars the four documents originated in the order J, E, D, P and their dates, not counting later additions, were approximately: J, 850; E, 750; D, 650; P, 500–450. It should be noted, however, that there are a few scholars (Koenig, Sellin, etc.), who, while accepting the Document Theory in some form, assign the documents to earlier dates, and a few who consider E earlier than J.

The efforts to determine the dates of the completed documents were followed by attempts to fix the age of the material embodied in these documents. The earlier adherents of the Graf-Wellhausen School were inclined to assign not only the completed documents, but practically all the material embodied in them to relatively late dates. Later investigations have clearly shown that much of the material, both historical and legal, must have been handed down, orally or in written form, from very early times.

It would be erroneous to think that no voices were raised against the modern views in general, and against the prevailing Document Theory in particular. Hengstenberg, Haevernick, Keil, Green and others did their best to uphold or re-establish the traditional views. Others, while admitting some truth in the newer views, proposed rival theories which, their authors believed, would explain all the facts without departing so far from traditional views. To this latter group belong A. Klostermann, James Orr, B. D. Erdmans, J. Dahse, A. Troelstra, H. M. Wiener and others. In general it may be said that these more recent theories are a combination of the Supplement Theory and a modified Document Theory. Unfortunately, the textual-critical foundations so necessary for the newer views are rather insecure. Consequently, though it may be admitted that many questions of Pentateuchal criticism are still unsettled and that some of the opinions now held may have to be modified, the Document Theory as presented in its main outlines by the Graf-Wellhausen School has still the better of the argument.

5. Mosaic Authorship.—The arguments in favor of the Mosaic authorship of the Pentateuch or Hexateuch have been skilfully wrought out by those who still favor the traditional view. (For a detailed discussion, consult F. C. Eiselen—'The Books of the Pentateuch,' chapters IV–VII). But the most that the facts presented by the defenders of the traditional view prove is that the Pentateuch contains elements going back to Mosaic times; which is far different from saying that the entire Pentateuch, with the exception of a few later interpolations or additions, was written

by Moses. They cannot even prove that these Mosaic elements were preserved in writing; oral tradition, faithfully preserved, would satisfy all the facts in the case. Nor is it possible to point out any of the Mosaic elements, for they may have undergone alterations, either accidentally in the course of oral transmission, or intentionally, at the hands of later editors or revisers. Putting the case briefly, the facts presented may be said to warrant the following conclusion and nothing more: Whatever the time of the final composition or compilation of the Pentateuch, it contains elements, both historical and legal, that may have originated in the days of Moses. These elements were later modified and expanded in the spirit of the first great leader, and the result of this development, continuing throughout several centuries, is embodied in the Pentateuch in its present form.

6. **The Pentateuch a Compilation.**—The modern view of the origin of the Pentateuch insists that the Pentateuch is a relatively late compilation of material taken from at least four distinct written sources, J, E, D, P, all of which reached their final form subsequently to the time of Moses. In support of this theory attention is called to facts like these: (1) The peculiar use in the book of Genesis of the divine names *Yahweh* and *Elohim*. There are large sections of Genesis and of the opening chapters of Exodus which systematically use the divine name *Yahweh*, while others use *Elohim* (For instance in Gen. i, 1-ii, 4a, the account of creation, *Elohim* is used 35 times and *Yahweh* not at all, while in ii, 4b-25, also dealing with creation, *Yahweh-Elohim* is used exclusively; in Gen. xii-xvi, *Yahweh* is used 27 times and *Elohim* not at all; in Gen. xxxiii-1, *Yahweh* occurs but once, *El* or *Elohim*, 67 times). Various explanations of the peculiarity have been attempted, but it receives a natural and satisfactory explanation only on the assumption that the sections were taken from productions of at least two different authors, one believing that the name *Yahweh* was known from the beginning, the other that it was revealed to Moses (Exod. iii, 13-16; vi, 2, 3; for a detailed discussion consult Eiselen, F. C., 'Books of the Pentateuch,' chap. VIII).

(2) The presence of repetitions and discrepancies, both in the historical and the legal portions of the Pentateuch, supports the theory of compilation. In the narrative sections these repetitions and discrepancies appear sometimes in narratives appearing side by side (compare, for instance, the stories of creation in Gen. i, 1-ii, 4a and ii, 4b-25), sometimes in narratives which, on first sight, appear to be continuous accounts of a single incident (for instance, the story of the flood in Gen. vi-ix), at other times in narratives found in different parts of the Pentateuch (compare, for instance, the duplicate accounts of the origin of names like Beer-Sheba, Gen. xxi, 31 and xxvi, 32, 33; Bethel, xxviii, 18, 19 and xxxv, 15, or Israel, xxxii, 28 and xxxv, 10, etc). Similar repetitions and discrepancies are found in the legal sections. Mention may be made of the several laws regarding the place of sacrifice (compare Exod. xx, 24, 25 with Deut. xii, 2-7 with Exod. xxvii, 1ff), the laws regarding the priesthood (for instance, compare Deut. xvii, 9, 18; xviii, 1;

xxi, 5, with Exod. xxviii, 1; Num. iii, 5-10 and xviii, 1-7) and the laws regarding slavery (compare Exod. xxi, 2-6 with Deut. xv, 12-17, with Lev. xxv, 39-42).

(3) The differences in theological conception, in style and vocabulary, serve as additional supports of the compilation theory. One need not go beyond the stories of creation to discover these differences (compare Gen. i, 1-ii, 4a and ii, 4b-25); but when we remember that the differences are equally marked in other parts of the Pentateuch, the strength of the cumulative argument can hardly be overestimated.

7. **Characteristics of the Documents.**—Some of the outstanding peculiarities of each of the four documents may be noted:

(1) *Peculiarities of Style.*—The stylistic differences between J and E are not as great as those between JE on the one hand and D or P on the other; which is due to the fact that J and E come from approximately the same age, the creative age, of prophetic narration. However, a few differences between J and E may be noted: J is the best narrator in the Bible. "His touch," says Driver, "is singularly light. With a few strokes he paints a scene which before he has finished is impressed indelibly upon the reader's memory." E is perhaps a little more terse in style, but his narratives are on the whole so well told that it is not easy to see wherein they fall short of J, except that at times they lack the spontaneous charm and strength of the other. P is stereotyped, measured and prosaic. The author shows a preference for standing formulæ and expressions. D can be compared only with the legal sections of P. While P is cold, legal, formal and precise, D is rhetorical and hortatory. In style the latter closely resembles the great prophets.

(2) *Peculiarities of Language.*—All that may be done here is to enumerate a few of the characteristic expressions of each document. The following words are characteristic of J:—"*Yahweh* is the name of the God of Israel even in pre-Mosaic times; *Sinai*, not *Horeb*, is the name of the mountain on which the law was given; *Israel*, not *Jacob*, is the name of the third patriarch from the birth of Benjamin on. The inhabitants of Palestine are called *Canaanites*; the regular name of Mesopotamia is *Aram Naharaim*; *Egypt* is used as equivalent to Egyptian. The longer form of the pronoun of the first person *anokhi* is used, not *ani*. Characteristic phrases are: *To find favor or grace in the sight of . . .*; *to call on the name of . . .*; *to run to meet . . .*; *took him a wife . . .*; *to preserve seed alive . . .*; *to dwell in the midst of . . .*; the particle *na* with the imperative, etc.

As characteristic of E may be noted: The use of the divine name *Elohim* in Genesis; the pre-Israelitish inhabitants of Palestine are called *Amorites*, not *Canaanites*; the mountain of God is called *Horeb*, not *Sinai*; from Gen. xxxii, 32 on *Jacob* is used in preference to *Israel*; the name of Moses's father-in-law is *Jethro*. Characteristic expressions are also: *the man Moses*, and *to bring up from the land of Egypt*, where J uses *to bring out*.

The linguistic peculiarities of P are very numerous. Driver enumerates 50 expressions characteristic of the narrative portions of

P, many of which occur never or rarely in other books, some of them only again in Ezekiel. Of these may be mentioned: The use of the divine name *Elohim* in Genesis; *Paddan Aram* is the regular name for Mesopotamia; the mountain of God is called *Sinai*, as in J, never *Horeb*. The shorter form of the pronoun of the first person singular *ani* is used 130 times, the longer form *anokhi* only once. The Hebrew *ammim*, meaning *peoples*, is used in the sense of *kinsfolk*, especially in the two phrases "that soul shall be cut off from his kinsfolk" and "to be gathered unto one's kinsfolk." Other peculiar expressions are: *To be fruitful and multiply . . . ; this selfsame day* (literally "the bone of this day") . . . ; *after their families . . . ; soul* (*nephesh*) in the sense of "person" . . . ; *throughout their generations . . . ; congregation of the Israelites . . . ; according to the mouth* (*command*) of . . . ; etc.

D also has its characteristic words and phrases: *Horeb* is used, not *Sinai*, as the name of the mountain on which the law was given; *that your days may be long . . . ; a mighty hand and a stretched out arm . . . ; the stranger, the fatherless, and the widow . . . ; and remember that thou wast a bondman in Egypt . . . ; to do what is right (or evil) in the eyes of Yahweh . . . ; with all the heart and with all the soul . . . ; to observe to do . . . ;* etc.

(3) *Peculiarities of Thought*.—J reflects a very primitive and pronounced anthropomorphic conception of deity. Yahweh is represented not only as forming human resolutions and as swayed by human emotions which is common also in later books, but as performing his acts in a human way. The J narrative shows less tendency than is seen in other parts of the Pentateuch to explain significant events by an appeal to the extraordinary, miraculous or supernatural. There is a more general recognition of the play of natural forces. (See, for example, the J story of the plagues of Egypt. Exod. viii, 1-4, 20-32; ix, 1-7, etc., and compare these with viii, 5-7; ix, 8-12, etc., and also the J story of the crossing of the Red Sea, Exod. xiv, 21). E reveals different and more elaborate theological ideas. The God of E appears not in bodily form but in dreams and he carries out his plans through the ministry of angels. Closely connected with this high view of Divine manifestations is the representation of Abraham as a prophet and Moses, though not called a prophet, is represented as entrusted with a prophet's mission. Both J and E have much to say about the sacred sites of Palestine. The theological conceptions of P are strikingly different. The author scrupulously avoids anthropomorphisms and there are no angels or dreams as means of communication. In the legal sections of P religion is defined in terms of ritual and form which is at variance with the spirit of J and E.

D, like the other documents, has its own peculiar theological conceptions. Its fundamental theological thought is expressed in Deut. vi, 4. and its fundamental law, reiterated again and again, in Deut. vi, 5. While J and E make mention of the old sacred places D will have nothing to do with them. While J and E seem to consider the pillar a perfectly

legitimate symbol of Hebrew religion, D prohibits the setting up of the pillar. While J and E permit the bringing of sacrifice in different places, D recognizes but one legitimate place of public worship.

These and other peculiarities clearly and convincingly point to diversity of authorship.

8. Post-Mosaic Elements.—If only the book of Genesis were a compilation Moses might, perhaps, be regarded as its compiler and the author of the remaining books (this was the view of Astruc). But if the entire Pentateuch is a compilation, this fact in itself makes belief in the Mosaic authorship practically impossible. There are, however, some additional specific considerations that have convinced scholars that Moses cannot be the author and that at least some portions come from post-Mosaic times. There are, for instance, certain literary considerations, such as the use of the third person, when speaking of Moses (Num. xxxiii, 2 or Exod. vi, 26, 27), or the account of Moses' death (Deut. xxxiv, 1-8). Again in the narrative portions (Deut. i, 5; iv, 41, 46, 47, 49, Num. xxii) the territory east of the Jordan is spoken of as "beyond Jordan," implying that the author lived west of the Jordan, which is not true of Moses. Residence in western Palestine is implied also in the use of the geographical term *neghebh*, i.e., the southern portion of Judah with the general meaning "south," and of "sea," with the general meaning "west." The name *Hebron*, used in Gen. xiii, 18; xxiii, 2; xxxvii, 14, and Num. xiii, 22, was of post-Mosaic origin (Josh. xiv, 15; xv, 13); the same is true of the name *Dan* (cp. Gen. xiv, 14; Deut. xxxiv, with Jdg. xviii, 29). In the same direction point passages like Deut. iii, 14 (cp. Jdg. x, 3, 4) and Gen. xl, 15.

There are also certain historical statements which point to a post-Mosaic date. Thus Gen. xxxvi, 31 presupposes the establishment of the monarchy in Israel; the expression, "the Canaanite was then in the land" (Gen. xii, 6; xiii, 7), has meaning only if written at a time when the Canaanites had disappeared at least as an independent people. Deut. ii, 12 and Num. xxi, 14, 15 look back to the conquest as an accomplished fact. Exod. xv, 13, 17, presuppose the establishment of Yahweh's sanctuary on Mount Zion. If Moses wrote the entire Pentateuch, is it not strange that he was in doubt regarding the name of his own father-in-law (cp. Exod. ii, 18; Num. x, 29, with Exod. iii, 1; xviii, 1). Moreover, the characterization of Moses in certain passages reads as if it came from some one other than Moses (for example, Exod. xi, 3; Num. xii, 3; Deut. xxxiv, 10). There are also some legislative enactments which presuppose a background other than that of the desert (for instance, Exod. xxiii, 19; Deut. xix, 14), and some archaeological references which seem to have originated at a relatively late date (for instance, Exod. xxx, 13, 34; xxxviii, 24-26; and Deut. iii, 11).

Now, while it is true that Moses might, perhaps, have written some of the passages enumerated, others cannot possibly come from him; and in every case the only natural interpretation is that which ascribes the passage to another and later author. Again, while some of the passages might, perhaps, be thrown out

as interpolations, others are so closely bound up with their context that they would carry with them large sections of the Pentateuch, and the resulting breaking up of continuity in narration would increase rather than diminish the difficulties. On the other hand, all the difficulties disappear if it is admitted that the narrative in which the alleged post-Mosaic elements are found were written in the period to which modern scholarship assigns them.

9. Chronological Order of the Pentateuchal Documents.—If the Pentateuch is a compilation, and if the documents used by the compiler were written subsequently to Moses, is it possible to arrange them in chronological order? In an attempt to solve the problem scholars have studied the documents along several lines, so as to determine: (1) The historical situation reflected in the documents; (2) the theological standpoint expressed or implied; (3) the relation of the Pentateuchal documents to other Old Testament writings; (4) peculiarities of vocabulary and style, and (5) the mutual relation of the documents. The conclusions reached may be summed up in these words: 1. J and E reflect the historical situation of the period of the judges and of the early kings; D that of the later kings, especially conditions presupposed in the account of Josiah's reforms and Jeremiah's prophecies; P that of the exilic and postexilic period, especially the age of Ezra-Nehemiah. 2. The theological standpoint of each document agrees with what is known of Hebrew theological thinking during the period to which the document is assigned by the historical background reflected in it. 3. J and E have points of contact with Old Testament writings known to have originated before B.C. 650 (for instance, the 8th century prophets); D with literature that can be dated between 650 and the exile (Jer., Kings); P with that of the exilic and post-exilic period (Malachi, Ezra, Neh., Chronicles). D appears to have been unknown during the period of the early monarchy, P before the exile. 4. The vocabulary and style of each document are just what they might be expected to be if the documents were written during the periods to which the historical background points. 5. In their legal as in their historical sections JE, D and P represent three successive stages of development; P implies the prior existence of D, D the prior existence of J and E. 6. All the available evidence points to the following approximate dates for the documents: J belongs to the early centuries of the monarchy, perhaps to the 9th century; E was written somewhat later, but still during the period of the early monarchy, perhaps a generation or two preceding the appearance of the 8th century prophets. D presupposes the activity of the 8th century prophets and was written during the reactionary reign of Manasseh, not far from 650 B.C. (See DEUTERONOMY). P originated among the descendants of the exiles in Babylonia about 500 or 450 B.C.

10. Growth of the Pentateuch.—In conclusion, a brief survey may be given of the several stages in the development of the Pentateuch.

(1) The earliest literary period in Israel, as among other peoples, was preceded by an age of song and story. The songs, dealing with significant incidents and events in the history of

the clan, tribe or nation, and with the heroic deeds of individuals, were highly prized and repeated both by the common people and by professional singers. Alongside of these songs existed stories and legends centring around important persons and events. Some of this material goes back to pre-Mosaic times.

(2) In the course of time collections of the songs were made, two of which are referred to in the Old Testament (The Book of the Wars of Yahweh, Num. xxi, 14 and The Book of Yashar, Josh. x, 13). Similarly, the individual stories were combined into cycles, centring around prominent persons who distinguished themselves in battle or in connection with other epoch-making events (cp. The Patriarchal Stories).

(3) After the occupation of Palestine the Hebrews assimilated in large part the native population and rededicated to Yahweh many of the local shrines and sanctuaries. With the sanctuaries some of the traditions that had grown up around the sacred places were taken over by the invaders.

(4) In time the new religion introduced by Moses permeated the early pre-Mosaic material and caused various other modifications that brought them into line with the newer and higher religious conceptions.

(5) The entrance into Palestine produced far-reaching social changes which necessitated the adaptation of older laws to the new conditions and to the formulation of new laws. At the sanctuaries, codes of such laws may have been made (cp. The Book of the Covenant), and in the same places efforts may have been made to preserve in more permanent form the songs and stories of the past.

(6) During the period of the United Monarchy traces of connected prose writing appear for the first time. The new literary interest continued to flourish, even after the division of the kingdom, and manifested itself among the prophets in the collection of ancient songs and stories, and their compilation, after impressing upon them the religious ideas of the collectors into extensive narrative works, which endeavored to trace history back to the beginning of man's life upon earth. Several compilations of this kind may have been undertaken, but only two of them, "The Yahwist," written in Judah, and "The Elohist," written in Israel, exerted marked influence on later literary developments affecting the growth of the Pentateuch.

(7) The next significant step was a combination of these two documents, "The Yahwistic" and "The Elohist," into one continuous history. This was done probably during the reactionary reign of Manasseh, when the lessons taught in and by these histories needed to be impressed upon the people. As might be expected, the Yahwist, which originated in Judah, where the combination was made—the northern kingdom having disappeared—was made the basis of the compilation.

(8) During the same general period the Deuteronomic Code, or D, assumed literary form. In a sense D marks a compromise between the prophets and the priests. The author or authors sought to make the prophetic teaching more effective by putting the lofty, prophetic principles into concrete form. Hence,

they adopted, as far as possible, previously existing forms, usages and traditions, and eliminating the lower elements they poured into them a deeper and more spiritual significance.

(9) After the acceptance of D as the law of the land during the reign of Josiah, the desirability of combining the new law code with the earlier documents was soon felt. This feeling received a new impetus after the dissolution of the national life, when the few remains of national literature came to be highly prized. Thus, at some time during the 6th century D was united with JE, the compiler, or compilers, introducing into the older work such modifications as were necessary to maintain or establish a logical arrangement.

(10) The publication of D with its prophetic note caused the priests to feel that their own interests and the interests of the phase of religion they represented demanded the collection into a short code of the more fundamental laws, dealing with the priests' interests and ideals. The result was the so-called "Law of Holiness" (Levit. xvii-xxvi. See article LEVITICUS), which was compiled shortly before the exile of B.C. 586.

(11) The Babylonian exile was of the greatest significance in the development of Israel's literature and religion. Religion became spiritualized, especially through the activity of Jeremiah and Ezekiel. But while the spiritualizing process was going on the question seems to have arisen in the minds of some: Having reached the higher stages of religion, how may the lapses of the past be avoided? The answer was: By insisting upon obedience to definite rules and regulations. With the promulgation of D the reign of written law had its beginning; the Law of Holiness and the laws of Ezekiel mark further steps in the same direction, but the highest development of the legalistic tendency may be seen in the Priestly Code, which originated among the exiles in Babylon.

(12) The new law, having behind it the authority of the name of Moses, soon came to be accepted and revered as final authority. In other words, the seat of authority was transferred from the present experience of communion with God to laws thought to have been given when God seemed much nearer to his people. This new interest in the past impelled some priest or priests who were under the influence of the new point of view to rewrite the early history of Israel, tracing it back to creation, perhaps for the sole purpose of providing a fitting historical setting for the laws of the Priestly Code.

(13) The necessity of amalgamating the two parallel histories of the Mosaic and the pre-Mosaic ages JED and P must have been felt soon after the compilation of the Priestly Code. As long as the two existed side by side as separate works, they would appear to compete for recognition as the authoritative work of Moses or of Yahweh. Such controversy could be avoided only by uniting the two into one continuous work. The task of fusing JED with P may have been undertaken by Ezra the scribe, or, if not by him, by some one else who was in hearty sympathy with the ideals of P.

(14) Thus, aside from minor alterations made at a later period, the Pentateuch reached its complete form before B.C. 400. The finished

production received the designation *Tōrah* or *Law*. Subsequently it was divided at natural dividing points into five parts or books, so that the whole came to be known as the "Five-Fifths of the Law." From this title came the name "Pentateuch," meaning "Five-Roll Treatise," which was coined by Greek writers, from whom it passed into Latin and other Western languages.

Bibliography.—1. *Old Testament Introductions* by Bennett, W. H. (New York 1899); Creelman, H. (New York 1917); Driver, S. R. (New York 1891; new ed., 1910); Gray, G. B. (New York 1913); McFadyen, J. E. (New York 1905); Keil, C. F. (Edinburgh 1869); Raven, J. H. (New York 1906). The last two represent the traditional point of view.

B., 'Genesis of Genesis' (Hartford 1892); 'The Triple Tradition of the Exodus' (Hartford 1894); Bissell, E. C., 'The Pentateuch' (New York 1885, traditional); Briggs, C. A., 'The Higher Criticism of the Hexateuch' (New York 1893); Brightman, E. S., 'The Sources of the Hexateuch' (New York 1918); Carpenter, J. E., and Harford-Battersby, G., 'The Hexateuch' (2 vols., London 1900; Vol. I is published separately under the title, 'The Composition of the Hexateuch'); Chapman, A. T., 'Introduction to the Pentateuch' (Cambridge 1911); Eiselen, F. C., 'The Books of the Pentateuch' (New York 1916); Finn, A. H., 'The Unity of the Pentateuch' (London, no date, traditional); Green, W. H., 'The Higher Criticism of the Pentateuch' and 'The Unity of the Book of Genesis' (New York 1895, traditional); Orr, James, 'The Problem of the Old Testament' (New York 1906); Simpson, D. C., 'Pentateuchal Criticism' (London 1914); Skinner, J., 'The Divine Names in Genesis' (London 1914); Troelstra, A., 'The Name of God in the Pentateuch' (London 1912); Wiener, H. M., 'Essays in Pentateuchal Criticism' (London 1910); 'The Origin of the Pentateuch' (Oberlin 1910); 'Pentateuchal Studies' (Oberlin 1912, against the Document Theory).

FREDERICK CARL EISELEN,
Professor of Old Testament Interpretation,
Garrett Biblical Institute.

PENTAUR (Egyptian, *Pen-ta-were*), an Egyptian scribe who died about the 10th year of the reign of Menephtah. He is famed as the copyist of the papyrus (Sallier 3) in which is recorded the poem celebrating the victory of Rameses II over the Hittites at Kadesh. Pentaur was long considered the author of the poem. In Egypt another person of this name was tried and convicted of treason in the reign of Rameses III. Consult Breasted, J. H., 'A History of the Ancient Egyptians' (New York 1908).

PENTECOST, George Frederick, American clergyman: b. Albion, Ill., 23 Sept. 1841; d. 7 Aug. 1920. He was private secretary to the governor of Kansas Territory in 1858 and later entered Georgetown University which he left to join the Union army, where he was chaplain of the 8th Kentucky Cavalry volunteers in 1862-64. After the war he held several Baptist pastorates, was pastor of Tompkins Avenue Congregational Church in Brooklyn 1880-87; en-

gaged in evangelical work with Moody in Scotland and England in 1887-88; and in 1889-91 conducted a mission to the English-speaking Brahmans in India. He was pastor of Marylebone Presbyterian Church, London, 1891-97, and of the First Presbyterian Church, Yonkers, N. Y., 1897-1902; and after that was sent by the joint boards of the Presbyterian and Congregational churches as special commissioner to the Philippine Islands, China and Japan. From 1914 he was the pastor of the Bethany Presbyterian Church in Philadelphia. He wrote 'The Angel in the Marble' (1876); 'Bible Studies' (10 vols., 1880-89); 'Birth and Boyhood of Christ' (1896); 'Precious Truths' (1898), and others.

PENTECOST (from the Greek *pente-koste*, the fiftieth), a Jewish festival, held on the fiftieth day after Passover (the 16th of Nisan), in celebration of the ingathering and in thanksgiving for the harvest. It may fall on the 5th, 6th or 7th of Sivan. Its establishment is related in Levit. xxiii, 15, 16 and Deut. xvi, 9-12. It was called the Feast of Weeks (Exod. xxxiv, 22) because it occurred at the end of a week of weeks, or seven weeks; the Feast of the Harvest (Exod. xxiii, 16); or the Day of First-Fruits Numb. xxviii, 26). It is celebrated by Jews of the present day on the 6th and 7th of Sivan—that is, between the second half of May and the first half of June. It is also a festival of the Christian Church, occurring 50 days after Easter, and is celebrated in commemoration of the descent of the Holy Ghost upon the disciples gathered together to celebrate the ancient feast (Acts ii, 1-4). It is called Pentecost in the Roman Catholic Church; but Whitsunday by Anglicans.

PENTECOSTAL CHURCH OF THE NAZARENE, also called the **HOLINESS CHURCH**, an American church body formed in 1908. Its most particular tenet is sanctification by faith after justification has been effected through the medium of divine grace. The Church maintains a collegiate institute at North Scituate, R. I., and maintains theological schools at Los Angeles, Cal., and at Pilot Point, Tex. It is also connected with Texas Holiness University at Peniel, Tex., and Arkansas Holiness University at Vilonia, Ark. The official publications are the *Beulah Christian*, Providence, R. I., *Holiness Evangel*, Pilot Point, Tex., and *The Nazarene Messenger*, Los Angeles, Cal. In 1919 the Church had 780 ministers, 941 churches and 33,419 communicants.

PENTELICON, the modern mountain range known as Mendeli. It is situated in Attica. The marble quarries on its slopes furnished material for the great public buildings of Athens. Consult Gardner, E. A., 'Ancient Athens' (London 1902).

PENTHESILEA, according to Greek legend the daughter of Ares and queen of the Amazons. She aided the Trojans in their struggle with Greece and was slain by Achilles, who was about to erect a tomb for her when Thersites reproached him so that Achilles slew the latter and the body of Pentheseia was thrown into the Scamander by Diomedes.

PENTLAND FIRTH, *pěnt'land fěrh*, a channel connecting the Atlantic Ocean with the North Sea, lying between the mainland of

Scotland and the Orkney Islands. It is about 14 miles long, east to west, six to eight miles broad and is regularly traversed by a steam-ferry. A current, setting from west to east at each tide, flows through it with a velocity of 6 to 12 miles per hour, meeting another tidal wave speeding from east and causing many eddies and whirlpools, rendering navigation exceedingly dangerous for sailing vessels. At its eastern extremity are the Pentland Skerries, a group of small islands and rocks, the scene of numerous shipwrecks. On the Muckle Skerry, about four and a half miles north by east of Duncansby Head, are twin lighthouses, 100 feet apart, with two fixed lights—the one 170 feet, visible 19 miles, and the other 140 feet high, visible 18 miles. Previous to the war more than 5,000 vessels a year navigated this passage.

PENTLAND HILLS, a mountain range of Scotland, of porphyry and greenstone formation, in the counties of Edinburgh, Peebles and Lanark, commencing three and a half miles south by west of Edinburgh, and extending southwest for about 16 miles. The highest summits are Scald Law, 1,898 feet, and Carnethy, 1,890 feet above sea-level. The water supply of Edinburgh is obtained from springs on these hills.

PENTLANDITE, a sulphide of iron and nickel worked for nickel in Gap mine, Lancaster County, Pa.

PENTONVILLE, London, England, a populous district in the parish of Saint James, Clerkenwell, first settled in 1773. It gives its name to the Pentonville Model Prison, built in 1840-42 in Caledonian road, in the adjacent parish of Islington. The prison is constructed on the radiating principle, so as to admit of thorough inspection, and contains accommodation for 520 prisoners. The treatment is to "enforce strict individual separation, with industrial employment and moral training." The advantages of this type of prison quickly brought it into prominence, and within a very short time a large number of such prisons were erected not only in England, but all over the civilized world.

PENTSTEMON, in systematic botany, a genus of chiefly American perennial herbs of the figwort family (or *Scrophulariaceæ*) having opposite or verticillate leaves and bright blue, purple, red or white flowers. The name of this genus is from two Greek words, *πεντε*, five, and *στέμον*, or warp (the latter word akin to the Latin *stamina*, a warp, a fibre),—two words conjoined, and thus expressing the idea of "five-stamened" plants, a notion that refers to the presence of a fifth stamen in plants of the genus. It is to be noted, however, that the stamen in question, unlike its four companion stamens, is imperfect, having no anther. The vast majority of the many species of this genus are natives of western United States. Two, perhaps three, species occur in the eastern half of the Union; while a few occur wild in Mexico. Many, cultivated under the name "Beard-tongue," are to be found in American gardens. A sterile filament, usually densely bearded, is characteristic of the plant. This perennial has pretty flowers which in the late spring and during the summer abound in

dry, rocky regions, giving at a distance a hyacinth-like effect to the landscape. In parts of the United States they are said to be very beautiful, especially somewhat to the southward.

Pentstemon pubescens of Solander is a common species, and its stem is found to range between one and three feet in length. Its leaves are oblong or lance-shaped, and its dull purple or partly whitish, nodding flowers open in a slender cluster. Its calyx is five-parted; its corolla tubular and slightly dilate, the throat being nearly closed by a bearded palate. It has four stamens perfect, and the fifth is a densely yellow-bearded sterile filament; and there is a single pistil. It occurs especially in dry soiled regions. *P. digitalis* of Gray, the white beard-tongue of more western localities and especially of Pennsylvania, is a very effective plant, which at times attains the height of five feet. It is perhaps the tallest member of the genus. An abruptly inflated corolla inclines toward a pure white flower in this species. Other species of the genus are (1) *P. lævigatus* of Solander, growing from two to four feet tall, with a white corolla sometimes purple-tinged; (2) *P. Cobæa* of Nuttall found on the plains from Kansas southward. It grows from one to two feet tall; has ovate, even denticulate leaves, and a few-flowered panicle or raceme, a pale purplish corolla, abruptly inflated above a narrow base. Its sterile filament is bearded. *Pentstemon Cobæa* is often found cultivated; (3) *P. ovatus* of Douglas, found in Oregon, is an early blue-flowered species, puberulent or pubescent, with ovate or lance-ovate serrate leaves, and an open panicle of small flowers; (4) *P. confertus* of Douglas, which grows from one to two feet tall, has lance-oblong, oblong, even linear, quite entire leaves. Its inflorescence is spike-like, interrupted and naked. Its corolla is small, cream or sulphur-colored. Yet in one variety of this species, *P. caeruleo-purpureus* of Gray, it is blue-purple and violet colored. This variety occurs in the Rocky Mountain area and in other parts of the West; (5) *P. campanulatus*, of Willdenow, is a plant with lanceolate leaves, the base clasping. It flowers in a raceme-like, one-sided panicle. Its corolla is reddish-purple or rose-colored; and its sterile filament is bearded. Common in gardens, this Mexican species varies greatly under cultivation; (6) *P. barbatus* of Nuttall, another species found in Mexico and in the United States as far north as Colorado, has been long under cultivation in gardens. Its slender, wand-like stems attain from three to four feet in height. Its leaves are pale, and it has a long, loose, raceme or panicle of drooping flowers. The corolla is narrowly tubular and of a scarlet hue. Some beard appears in its throat but its sterile filament is naked; (7) *P. grandiflorus* of Nuttall, is pale and graucous, with thick ovate leaves, closely sessile and entire; the upper ones are rounded. Its short-pediceled flowers are lilac-purple; its oblong, bell-shaped corolla is almost equally five-lobed; and its sterile filament is nearly smooth. Its home is in Wisconsin and to the west and southward of that State; (8) *P. glaber* of Pursh, found on the great plains from Dakota, south and west. Its ascending stems are from one to two feet long. Its leaves are lanceolate or lance-ovate, and it bears a narrow panicle of very handsome flowers; the tubular-inflated

corolla being of a bright purple-blue hue, with spreading lobes. Its sterile filaments are found either slightly hairy or else entirely naked; (9) *P. Hartwegi* of Bentham (or *P. gentianoides*), with lanceolate leaves, elongated peduncles, three-flowered and a corolla of a deep red or red-purple, is found wild in Mexico; and has also passed under cultivation.

Plants formerly called *Chelone* or *Turtle-Head* (q.v.) (*Chelone barbata* and *Chelone campanulata*) are now classed among *pentstemons*.

PENUMBRA. See ECLIPSE.

PENZA, pěn'zä, Russia, (1) the capital of a government of the same name, beautifully situated on an eminence at the junction of the Penza and Sura, 492 miles by rail southeast of Moscow. It is the see of a Greek Catholic bishop. It was founded in 1666 by Michael as one of four fortified defenses against Tartar incursions, and consists of an old town with wooden houses, and a new town with many fine mansions and residences, and handsome churches standing in the centres of large open squares. In the upper end of the town is Cathedral square in which are located the Greek cathedral, the courthouse and the governor's residence. In the town are several beautiful gardens, a large park, and numerous good educational institutions, including a horticultural school connected with the Imperial Botanical Gardens located here. It possesses paper mills, lumber and flour mills, cloth factories, iron works, tanneries, soap-boiling and candle-making establishments, etc. Penza is the market place for certain characteristic textile manufactures of goats' wool, made in the government. Here also are held two fairs in each year for sales of the horses and cattle bred in the neighborhood. Pop. 83,100 (1917). (2) A government of central Russia, bounded north by Nipni-Novgorod, west by Tamboy, south by Saratov, and east by Simbirsk, has an area of 14,997 square miles. Its surface is undulating and intersected by low hills separating the basins of the Oka, Don and Volga, the last of which receives the far largest share of the drainage indirectly. The Moksha and Sura rivers are navigable and support a large and active traffic. The climate is rather severe; the average yearly temperature being 40°, with extremes of 12° in January and 68° in July. The soil is a fertile black loam. The forests are extensive, especially in the north. Agriculture is the chief industry, and the region has large areas devoted to the sugar beet which flourishes here. Cattle and horses are raised in quantity, and much grain is grown. Bee-keeping is widely followed. Mill-stones are quarried. The chief exports are corn, flour, spirits, leather, soap, wax, honey, potash, wool and timber. Manufactures are steadily progressing in the government. Pop. 1,940,500.

PENZANCE, pěn-zäns', England, a seaport town of Cornwall, picturesquely situated on the northwest margin of Mount's Bay, on a finely curved shore, bordered by rocky heights, 26 miles southwest of Truro. It is the terminus of the Great Western Railway. Besides three fine parish churches, it has various Dissenting chapels, a handsome town-hall, market-house and custom-house; a grammar school, and science and art schools; a geological society

with a valuable collection, a public library, and other scientific or literary institutions. The harbor is small, about 25 acres, and is formed by a breakwater, with a lighthouse at the extremity. The climate is extremely mild, though moist, and it is highly esteemed as a health resort. It is a large gardening section raising early vegetables for the London market. The principal industries, however, are fishing and shipping. There is a large export of tin and copper, china-clay, mackerel and pilchards to Italy. The town was burned by a band of Spanish marauders in 1595, and was sacked by Fairfax in 1646. Pop. about 15,000.

PEONS AND PEONAGE. Peon is a Spanish word signifying a day laborer, and in South America is applied especially to Indians. By the word peonage is meant compulsory service based on the indebtedness of the peon to the employer. By the civil law under the Spanish colonial system, and by special statute in some countries, as for instance by the law regulating contracts between masters and servants in Mexico, peons are compelled to continue to work for their employers, if they are in debt to the latter, until the debt is paid. They receive wages, amounting in Mexico to \$5 a month. The condition which arises is that no effort is made by the peon to keep out of debt; on the contrary, the larger his debt the more secure he feels, and if the employer insists on scaling down the indebtedness, it is not only regarded as an insulting lack of confidence, but also as notice of a coming discharge. On his side, however, the peon may demand a statement of his account at certain intervals, and be allowed 17 days freedom to look for a new employer willing to buy his account—that is, pay the debt to the former employer, and take over the peon worker and his indebtedness. In Colombia peonage is at its worst. The peon is obliged to work for the employer whom he owes four days in every week. For this service he receives five cents per day if on the uplands, 10 cents if on the lowlands. He has the use of an acre or more of land upon which to raise food for his family, and except for the prescribed four days (eight hours each) his time is his own. As a rule "trading" is done at the store of his employer, and the peon is at his mercy if disposed to demand extortionate prices. It is alleged that many proprietors, by enticing the peons in their employment into needless expenditures, and by selling them goods and advancing them money, contrive to keep them hopelessly in debt and in a consequent state of bondage. The creditor, however, has no power over the wife and children of the peon, nor can the latter be sold like a slave. Peonage was abolished in the Argentine Republic in 1886.

In the United States peonage has always existed to a greater or lesser extent, especially in the Southern States. When Arizona and New Mexico came under the jurisdiction of Congress it was found that the local laws and customs recognized the peonage system, and it continued until 1867, when Congress abolished peonage in the United States and the territories thereof. This condition of qualified servitude is still more or less prevalent in the South, and in some places the brutalities perpetrated have led to the indictment and prosecution

of offenders for violations of the statutes. Since 1890 the prosperity of the Southern States has rivaled that of the North, and the demand for labor has been phenomenal, and employers, especially in the naval stores industry and on the plantations, have had great difficulty in securing workmen. As a result of these conditions there has been a great demand for convict labor (q.v.). In many instances persons, white as well as black, apparently without money or friends, have been arrested by the local constable and arraigned before the police or justice of the peace court. At this point it has been customary for an employer or agent of a large employer of labor to appear on the scene and induce the prisoner to plead guilty to a trivial offense, with the understanding that the employer (who is quite often in conspiracy with the court officials) would pay the fine and prevent an imprisonment. A written acknowledgment of debt is secured from the victim, in which he agrees to work for the person paying the fine, either on his plantation or in his labor camp. The victim is then taken to the place of labor, and finds that he is guarded there like a convict. If he turns to and works diligently so as to pay off the debt due his employer, he is charged with all kinds of goods at high prices, and the debt is held over him for an indefinite period. If, on the other hand, he revolts and escapes, he is run down, arrested without process, returned to the private prison and perhaps beaten brutally.

Another way of securing victims is for the employer or his agent to proceed to some town or city and to hire a lot of laborers, agreeing to pay them certain wages and their railroad fare to the place of labor, and to advance them provisions from the company store, or, as it is commonly called, the commissary. The laborers arrive, and at the outset are indebted to the employer, who sees that they trade out their wages at the commissary, and in many instances, by a system of deductions and false entries, manages to keep the laborer perpetually in debt. If the laborer has a family, so much the better for the employer; they must live out of the commissary, and if the laborer runs away his family is detained at the camp. The writer has known of an employer withholding young children from both father and mother for the purpose of forcing the payment of a debt. If the laborer escapes, the machinery of the local criminal law is put in motion to arrest and return him under the charge of false pretenses, cheating and swindling; or, in the State of Florida, under the law relating to false promises. If the runaway is arrested he is seldom tried before the courts. The arresting officer, often in the pay of the employer, induces the victim to return to work rather than go to jail, and so he returns to bondage with a heavier load of debt to carry, for the cost of pursuit and arrest is charged to him. Often no process is issued for arrest, but the employer arrests without process, returns the prisoner to his labor camps and inflicts severe chastisement. Many of the labor contracts contain provisions to the effect that the laborer consents to allow himself to be locked in a stockade at night and at any other time when the employer sees fit to do this.

On 2 March 1908 the House of Representa-

tives passed a resolution requesting the Immigration Commissioner to investigate the treatment and conditions of labor of the immigrants on the cotton plantations of the Mississippi Delta, in Mississippi and Arkansas, and also on the turpentine farms, and in the lumber and railway camps of Florida, Mississippi, Louisiana and other States. The commission made an exhaustive inquiry, and developed the fact that cases of peonage existed in every State in the Union excepting Oklahoma and Connecticut. Most of those in a condition of peonage in the South had been sent there from New York City, their fare thither constituting the first link in the chain of debt which ever grew heavier. It was found that the root of the system was in the terms of the contract-labor laws, which made the flight of a man in debt for money or goods or transportation advanced, *prima facie* evidence of intent to defraud; and thus it was easy to bring about their arrest and sentence to jail, unless the employer paid a fine to be charged up on the peon's account. The courts in Virginia, West Virginia, North Carolina, Georgia, Florida, Alabama, Mississippi, Arkansas and Missouri found methods of safeguarding the rights of the peons, and have done much toward ending the condition; and the Supreme Court in the historic Clyatt case ruled that while there is no law against peonage, it was unlawful to arrest and confine a man for debt, and that damages might be recovered therefor. The condition of peonage is still in uninterrupted sway in some of the New England lumber camps, and to some extent in every cosmopolitan city.

In New York and San Francisco thousands of Chinese coolies, mostly employed in laundries, exist under a system of peonage not unlike that in vogue in the South; while the Italian padrone system, which has always held sway in the Italian quarter of New York City, has held hundreds of immigrants in slavery. These two evils of metropolitan life have received scant if any attention from the Federal, State or municipal authorities.

PEONY, a genus (*Pæonia*) of the family *Ranunculaceæ*. With one exception (*P. brownii*) the species are natives of Europe and Asia. They are practically all in cultivation in gardens, being valued for their hardiness, easy cultivation and large, attractive flowers. They are mostly herbaceous perennials with tuberous rootstocks, large pinnate leaves and flowers ranging through all shades of red to white and yellow. Many garden varieties and hybrids have been produced, including numerous double forms. The plants will grow in almost any soil, but thrive best in rich, rather moist deep loam. The crowns should be buried two inches below the surface and the ground, especially close to the plant, kept free from weeds. When once established annual dressings of stable manure should be given and the plants left undisturbed. Properly treated peonies will often prove satisfactory for 25 years without removal or renewal. The most popular species is *P. officinalis*, a native of southern Europe, which produces large flowers abundantly during late spring. The next most popular is probably *P. albiflora*, a native of Siberia, blossoming about a month later than the preceding species and having fragrant flowers. A large number of the cultivated forms are derived from these

two species. The roots of the latter are used by the Tartars for food. Several species are known as Chinese peonies but this term is more widely applied to hybrids and varieties of a more extended list than the native Chinese kinds. They are often fragrant and double-flowered. The tree-peony (*P. moutan*) often grows five feet tall, is much branched, and prolific of bloom. It is somewhat less hardy than the common peony and in the North is often grown as a greenhouse plant. It is a native of China, where it has long been cultivated and where there are hundreds of varieties. In America it is less known than the first two species. When grown out of doors the tree-peonies should be mulched with litter or leaves if in exposed places, especially north of Philadelphia.

PEOPLE'S INSTITUTES. The people's institute purposes to promote broader co-operation between different classes of society, to increase the spirit of tolerance between different religious and racial groups, to create a social consciousness and civic pride. Two significant movements are to be recorded for the last two decades. The People's Institute of New York City was organized in 1897 in Cooper Union; the Rochester Social Center was organized in the autumn of 1907 as part of the extension activities of the Rochester public schools. The undertaking is a large one. Religious predilections are deeply rooted; political theories and party allegiances give rise to intemperate discussions, racial and political customs among immigrants constitute serious social barriers. But to name the difficulties confronting this socializing effort is to emphasize its importance. The plan has commended itself to many communities but few have been able to avoid the pitfalls of politics and prejudice. The people's institute may become the nerve centre of democracy but it must be built on very generous lines.

Activities.—The activities of a people's institute are both intellectual or cultural and social. Anything that promotes sociability and stimulates the intellectual and moral life is a legitimate part of the work. Lectures, concerts, debates, study-groups, folk-dramatics, games, dances—such is the program.

Community interests focus the community attention. Social welfare, civic improvements, public sanitation, are used to awaken a social consciousness and social solidarity is an inevitable consequence as soon as a common interest has been found to intensify and fix community thought. It is reasonable to expect free discussion of political doctrines in a people's institute. But campaign speakers may not be safely included on the program until a community has been educated to a large measure of intellectual self-control. The people's institute is another form of educational extension and should be considered with PARENT-TEACHER ASSOCIATIONS, EDUCATION, IMMIGRANTS, CONTINUATION SCHOOLS, MOTHER'S CLUBS and the LYCEUM MOVEMENT (qq.v.).

A. R. BRUBACHER.

PEOPLE'S PALACE, a building in the East End of London, situated in Mile-end Road, opened by Queen Victoria, May 1887. It provides for the population of the East End a hall for concerts and other entertainments, a library

and reading-rooms, gymnasias, swimming-baths, social-meeting rooms; rooms for games, refreshment-rooms, a winter-garden, technical schools, etc. The first year the membership was 4,200. The nucleus of the palace was the Beaumont Philosophical Institute, founded by J. T. B. Beaumont (died 1840), who left \$60,000 to establish an institution for the moral and intellectual improvement of the working-class in the East End of London. A movement set on foot by a novel by Sir Walter Besant—"All Sorts and Conditions of Men"—in which a "Palace of Delight" was described, resulted in raising the fund to \$375,000, and with this largely increased fund the People's Palace was constructed. It is supported mainly by the annual contribution of \$35,000 made by the Drapers Company of London. The technical schools, organized under the title of "The East London Technical College," now rank as a school of the University of London with the title of "The East London College," and as such receives a grant of \$17,500 annually.

PEOPLE'S PARTY, The, or POPULIST PARTY, an American political party with national and State organizations, originally formed at a national convention held at Cincinnati, Ohio, 19 May 1891. The People's party was the outgrowth of various smaller organizations like the Greenback party, the National Farmers' Alliance, the Grangers and other bodies composed of workmen and the agricultural classes. It became the third political party in size and strength, next to the Republican and Democratic parties, and for over a decade was an important factor in American politics. The original convention platform demanded:

The free and unlimited coinage of silver; the abolition of the national banking system; the issue of fiat money in sufficient quantity to transact the business of the country on a cash basis, and the loan of such currency to the people at not more than 2 per cent per annum on non-perishable agricultural products; national ownership of all means of public communication and transportation; a graduated income tax; popular election of United States senators; the adoption of the initiative and referendum in legislation; and the prohibition of alien ownership of land.

In 1892 the second National Convention of the People's party met at Omaha, Neb., on 2 July, to nominate candidates for President and Vice-President, and adopted substantially the same platform as that promulgated at Cincinnati. The nominees were James B. Weaver of Iowa, for President, and James B. Field of Virginia, for Vice-President. At the subsequent election in November the ticket received 22 electoral votes and a popular vote of 1,055,424. In the next Presidential campaign, that of 1896, the party nominated William Jennings Bryan, for President, and Thomas E. Watson of Georgia, for Vice-President. The platform adopted at the National Convention was as follows:

1. We demand a National money, safe and sound, issued by the General Government only, without the intervention of banks of issue, to be a full legal tender for all debts, public and private; a just and equitable, and efficient means of distribution, direct to the people, and through the lawful disbursements of the Government.

2. We demand the free and unrestricted coinage of silver and gold at the present legal ratio of 16 to 1, without waiting for the consent of foreign nations.

3. We demand that the volume of circulating medium be speedily increased to an amount sufficient to meet the demands of the business and population, and to restore the just level of prices of labor and production.

4. We denounce the sale of bonds and the increase of the public interest-bearing debt made by the present Administration as unnecessary and without authority of law, and demand that no more bonds be issued, except by specific act of Congress.

5. We demand such legislation as will prevent the demonetization of the lawful money of the United States by private contract.

6. We demand that the Government, in payment of its obligations, shall use its option as to the kind of lawful money in which they are to be paid, and we denounce the present and preceding Administrations for surrendering this option to the holders of Government obligations.

7. We demand a graduated income tax, to the end that aggregated wealth shall bear its just proportion of taxation and we regard the recent decision of the Supreme Court relative to the income tax law as a misinterpretation of the Constitution and an invasion of the rightful powers of Congress over the subject of taxation.

In this campaign of 1896 Bryan also received the nomination of the Democratic party, and a majority of the People's party also voted for the Democratic Vice-Presidential candidate, W. J. Sewall of Maine. Those who remained steadfast to the Bryan and Watson ticket were popularly known as "Middle-of-the-Road Populists." Bryan received 176 electoral votes, Sewall 149 and Watson 17. Various State conventions of the People's party in 1898 adopted substantially the same declarations of principles, the salient points of which were: The free and unrestricted coinage of silver and gold at the ratio of 16 to 1, without waiting for the consent of other nations; the speedy increase of the circulating medium to an amount sufficient to meet the demands of a growing business, and no further issue of United States interest-bearing bonds. Other demands of these conventions were for postal savings banks, the government ownership of railroads, telegraph, telephones and lighting plants; the construction and ownership of the Nicaragua Canal by the United States; the election of United States senators by the direct vote of the people and the adoption of the initiative and referendum. "Government by injunction" was denounced; also all funding bills calculated to extend the time for the payment of the Pacific Railroad debt. All conventions commended the action of the United States in making war upon Spain and promised the support of their party to the government in its efforts to carry it to a successful issue. The North Carolina convention opposed "the domination of gold and monopoly" and favored the "overthrow of national banks and railroad influence in controlling legislation." The Nebraska convention demanded "more money and less misery for the people" and protested against the retirement of the greenback.

At the close of the campaign of 1896 much opposition arose among Southern Populists against a further alliance with the Democratic party and spread northward. On 14 Feb. 1897 the first open rupture occurred at Grand Rapids, Mich., in a State convention, and resulted in two State organizations. On 22 Feb. 1897, at a meeting of the Populist Reform Press Association at Memphis, Tenn., a committee was appointed to endeavor to heal the differences, and call a conference, if deemed necessary. The Nashville Conference, held 3, 4 and 5 July 1897, was the outcome, but turned out to be a mid-road convention. A National Organization Committee, similar to the National Committee, was appointed with power to call a National Convention if deemed necessary. This committee called a convention, which was lightly attended, at Cincinnati, Ohio, on 5 Sept. 1898.

In February 1900 a meeting of the regular National Convention was held at Omaha, Neb., resulting in a complete separation of the factions and a call for a national convention from each—the fusion at Sioux Falls, S. D., and the anti-fusion at Cincinnati, Ohio, both for 9 May. The Sioux Falls Convention, in addition to the platform of previous conventions, vigorously denounced the imperialistic policy of the government, expressed sympathy with the Boers in their struggle with Great Britain, advocated public ownership of public utilities and condemned the practice of the courts in issuing injunctions in labor disputes between employees and employers. William J. Bryan was nominated for President and later by the Democratic Convention. Charles A. Towne of Duluth, Minn., was nominated for Vice-President after a lively contest to leave the second place vacant until action by the Democratic National Convention, and to accept the nominee. After the Kansas City Convention Mr. Towne declined the Populist nomination and the Populist National Executive Committee substituted Mr. Stevenson, the Democratic nominee. The Cincinnati Convention nominated Wharton Barker of Philadelphia, Pa., for President, and Ignatius Donnelly of Saint Paul, Minn., for Vice-President, and adopted as its platform:

(1) Initiative and referendum; (2) public ownership and operation of those means of communication, transportation and production which the people may elect; (3) land for actual occupation only and alien ownership prohibited; (4) a scientific, or absolute paper money, based upon the entire wealth and population of the nation, not redeemable in any specific commodity, but a full legal tender for debts, taxes and public dues, issued by the government only in sufficient quantity to meet the demands of commerce, and free coinage of silver and gold at 16 to 1 until such currency system could be established; (5) graduated tax on incomes and inheritances; (6) election of president, vice-president, senators and Federal judges by direct vote of the people; (7) direct nominations.

Both wings of the People's party maintained national committees in 1903-04 with a representative from every State in the Union, and in the summer of 1903, through the initiative of the fusion wing, a joint meeting of the two National conventions was held at Denver, Colo., resulting in harmony, and in a united call for a meeting of both committees at Saint Louis, Mo., on 22 Feb. 1904 when plans for the approaching National campaign were discussed and it was positively decided to nominate independent candidates for the offices of President and Vice-President. At the National Convention, held later in the year, therefore, Thomas E. Watson of Georgia and Thomas H. Tibbles were selected to represent the party in the forthcoming election, at which they received a popular vote of 120,903. On 27 Dec. 1906 the Populist party in Kansas was officially disbanded. In 1908 the Populists polled only 28,131 votes for their candidates, Thomas E. Watson and Samuel W. Williams. The decline of the party appears to be jointly due to the increased rural prosperity since 1900, to its alliance with the Democrats, and to the fact that most of its demands have been enacted into law by the older parties. Consult McKee, 'National Conventions and Platforms' (1900); Reynolds, 'National Platforms and Political History' (1898); Peck, H. T., 'Twenty Years of the Republic' (New York 1907); Woodburn, J. A., 'Political Parties and Party Problems in the United States' (2d ed., ib. 1914).

PEORIA, pē-ōr'ia, Ill., the second largest city in the State and county-seat of Peoria County, situated on an expansion of the Illinois River called Peoria Lake, 155 miles southwest of Chicago. It is the centre of an extensive railroad system consisting of the Minneapolis and Saint Louis, the Toledo, Peoria and Western, the Lake Erie and Western, the Chicago, Burlington and Quincy, the Chicago, Peoria and Saint Louis, the Chicago and Alton, the Chicago, Rock Island and Pacific, the Chicago and Northwestern, the Sante Fé, Illinois Central, the Big Four, Vandalia, Rock Island and Peoria, Illinois Traction System and various other roads with interurban lines in course of construction. Many of these lines connect with the belt system of the Peoria and Pekin Union and with the Peoria Railway Terminal. The city is also connected with Chicago by the Illinois and Michigan Canal—five-foot channel, and the Illinois River is continuously navigable, eight feet from LaSalle, Ill., to the Mississippi River, giving an extensive trade by water. Peoria is built on a plateau 40 feet above the river extending back over the bluffs for two miles and completely surrounded with rolling prairies. It covers an area of about 10 square miles. Eighty-two miles of its streets are paved; it has a complete sewage system with all modern improvements and is noted for its beautiful parks, which are connected by boulevards. Bradley and Glen Oak parks are the largest and finest.

Industries.—Situated as it is, in the heart of an unrivaled agricultural region, a large portion of which is devoted to corn, the city possesses a great wholesale and retail trade in groceries, farm implements, hardware, dry goods, boots and shoes, drugs, paper, china and accessories. Nearby are large bituminous coal fields. The city is also the centre for a tremendous trade in fish, of which hundreds of thousands of pounds are caught in the Illinois River and shipped alive to Eastern cities. Peoria is undermined by a vast basin of water, percolating through gravel and affording to the manufactories an endless supply of absolutely pure water. This water maintains a temperature of 53 at all seasons of the year and this fact enables the manufacturer of corn products to secure the largest amount of starch from every bushel of corn, and has made the city a favorite place for the manufacture of glucose and alcohol. It is also the seat of several meat packing-houses, two large strawboard factories and other paper mills. Peoria is first in the manufacture of diversified agricultural implements and third in aggregate output; roofing, paper mills, wire fence works, paper bag mills, steel mills, agricultural implement factories, automobile works, foundries and other industries. It has been proven that Peoria possesses an advantage of 6 per cent in the manufacture of distillery products over any other point in the world. The city ranks first in the products of distilleries among the cities of the Union. The distilleries, of which there were seven until the manufacture of whisky was stopped by the government consumed over 100,000 bushels of corn daily, and paid into the United States treasury in internal revenue tax, on the manufacture of alcohol and high wines, \$35,000,000 per year, a larger sum than any other revenue district in the United

States. Peoria has long been the centre of an enormous grain trade.

In 1918 Peoria ranked second in the receipts of corn, Chicago being first and Omaha third. Alcohol now produced is for the government. The remaining distillery plants have been converted to flour and syrup mills.

Peoria has 10 banks and savings institutions, one of which is the largest bank in the State outside of Chicago.

Public Buildings, Charitable Institutions, etc.—They are the city hall, court house, United States post office, numerous libraries, churches and public schools. The charitable institutions include the Proctor, Guyer and Bradley homes for the aged; the Proctor, the Peoria State, the Methodist and Saint Francis hospitals; Saint Joseph's Home, Home of the Good Shepherd and the Home for the Friendless.

Educational Institutions.—Besides an excellent public school and high school system consisting of two high and 22 grammar schools, there are—Bradley Polytechnic Institute, allied with the Chicago University (q.v.), endowed with \$3,000,000 through the liberality of Mrs. Lydia Bradley, Spalding Institute endowed by the late Archbishop, John Lancaster Spalding (q.v.); the Academy of Our Lady of the Sacred Heart, several parish elementary schools and several conservatories of music. There are also the Peoria Law Library and a fine public library and branch libraries containing 100,000 volumes.

Government.—The city is governed by a mayor and city council, elected every two years. The mayor appoints, subject to the approval of the council, all administrative city officials, except the city attorney, treasurer, police magistrate and city clerk, who are chosen by popular vote. The expenditures for the year 1918, for municipal maintenance and operation amounted to \$1,565,431.31, the principal items of which are as follows: Schools, \$819,736.91; police department, \$107,041.96; fire department, \$112,320.56; public works, \$124,608.55 and street lighting, \$67,138.78. The balance is made up of miscellaneous items. Peoria has a magnificent park system, embracing some 500 acres. Bradley, Glen Oak and Madison Parks are the largest. A scenic drive-way two miles long runs along the brow of the bluffs, 400 feet above Peoria Lake and the valley of the Illinois and affords a view of unrivalled beauty and extent. The park system has to date cost nearly \$3,000,000. The annual expenditure is approximately \$125,000.

Population.—In 1900 there were in the city as residents 8,900 people of foreign birth and 1,400 colored persons. Since the Federal census of 1900 was taken, North Peoria has been annexed, increasing the population nearly 3,000. Population (1900) 56,100; (1910) 66,950. Federal census report 1920, 76,121 within city limits. Population, Greater Peoria, the three-mile district, 100,000. Directory census, 1918, 105,000.

History.—The site on which Peoria stands was originally a small Indian village and was visited by missionaries who were trying to convert the savages. LaSalle stopped here in 1680 for the winter and built a fort called Fort Creve Cœur which was abandoned the next year. The place afterward became a seat for considerable traffic in furs. In the last half

of the 18th century French traders made a settlement here, but they were regarded with suspicion by the American, who looked upon the French as allies of the Indians. In 1783 Col. George Rogers Clarke conquered the settlement and shortly afterward erected a fort called Fort Clark which was in existence to 1818 when it was destroyed by fire. In 1812 General Craig with a small force of United States soldiers drove the French away altogether from the Illinois River. Congress afterward settled the claims of the French for damages caused by these depredations, by granting a tract of land to the original occupants of the soil, and these claims known as "The French Claims" were clouds on much of the property where the present city stands and have only been settled in recent years. In 1819 a new colony took possession of land, at first cultivating the land and giving attention only to farming, but gradually a village community was formed and in 1835 Peoria was incorporated. It was chartered as a city in 1845.

S. A. OAKLEY,
Editor Peoria Star.

PEORIA INDIANS, a North American tribe of the Illinois Confederacy, who formerly resided on the shores of Peoria Lake in central Illinois. In 1673 they were located on the west side of the Mississippi near the mouth of a river now believed to be the Des Moines. In 1688 they were found on the Upper Iowa River. After the war of the northern tribes against the Illinois Confederacy, the Peorias crossed over into Missouri. The main body, however, remained on the east bank of the Illinois River until 1832. In that year the tribe, very much reduced in numbers, sold to the United States all their claims in Illinois and Missouri and removed with the Kaskaskias (q.v.) to a reservation on the Osage River, Kansas. In 1861 with the Wea and Piankashaw tribes they took up their residence on a reservation in Indian Territory, now Oklahoma. In 1914 they numbered less than 150, the majority being of mixed blood, very few, if any, remaining of the original tribal stock.

PEPE, pà'pà, Guglielmo, Italian general and revolutionist; b. Squillace, Calabria, 15 Feb. 1783; d. at Turin, 9 Aug. 1855. When but 16 years old he joined the French party in Italy against Cardinal Ruffo and was captured and condemned to death, a sentence afterward commuted to exile. In 1802 he organized a conspiracy against Ferdinand IV., but was arrested and imprisoned. He was rescued by Joseph Bonaparte with whom he served for some time in the Parthenopean army, then fought with the French against Spain and later served under Murat, gradually working up in the service until he attained the rank of lieutenant-general in 1815. In 1820 he joined the Liberal party of Naples, known as the Carbonari, and in that year commanded the military revolt against the king. He entered Naples in triumph, 6 July 1820, and forced the king to accept his new constitution, but on 7 March 1821 was defeated at Rieti by the Austrians. He was again exiled and fled to London. The Austrian government with the sanction of the Holy Alliance then replaced the Bourbons on the throne. He returned in 1848, however, and was made commander-in-chief of the Neapolitan forces in

the war with Austria and regained his lost favor by his gallant but ineffectual defense of Venice in 1849. He then abandoned his military career and retired to Paris; but returned to Italy in 1851, where he died four years later. At his request his remains were removed to Naples for burial. Among his works are 'Relation des Evénements Politiques et Militaires de Naples en 1820 et 1821' (Paris 1822); 'Mémoires Historiques, Politiques et Militaires sur la Revolution de Naples' (London 1823); 'Mémoires du Général Guillaume Pepe' (2 vols., Paris 1847); 'Histoire des Révolutions et des Guerres d'Italie en 1847-49' (1850).

PEPI I, or **PHIOPS**, the third Egyptian monarch of the 6th dynasty, called also **MERIRA**. His reign began in 2795 B.C. and was prosperous and of some length. He is the first warlike Egyptian king of whom any record exists. He made an expedition against the Asiatic Mentu, who had gained possession of the Sinai Peninsula, and with large levies, against the Herusha and the Amu, people inhabiting the desert region east of the Delta. The latter enemies again assembled farther northward and again were defeated. He also sent a naval expedition against the "Terehbah," believed to have been the Syrians. The negro races of the south appear in Pepi's time as subjects to Egypt and furnish a contingent for the wars. He executed several public works and left more monuments and records than any other Egyptian ruler previous to the 12th dynasty. He is credited with having built the Sakkarah pyramid. His son, Pepi II, also called **MEREN-RA**, is remarkable for having reigned 90 years. However, the kingdom was in a sadly deteriorated condition at his death.

PEPIN, pēp'in (Fr. pā-pān), or **PIPPIN II**, known as **PEPIN LE GROS** or **PEPIN OF HERISTAL**, Duke of the Franks: d. Jupille, 16 Dec. 714. He became mayor of the palace in Austrasia, under Dagobert II., fought successfully against the Germans and by the victory of Testry (687) gained control of Neustria and Burgundy and was recognized as mayor of the palace in the three kingdoms, becoming thus the actual ruler of France for 27 years, though appearing to serve under four nominal kings. His power was royal and generally despotic, though he permitted the defeated king of Neustria, Thierry III., to retain the title, the latter being the first of the so-called "do-nothing" kings (*rois fainéants*). A side light is thrown on his character by the commissioning of Willibrord as a Christian missionary to Friesland and his establishing a see for him at Utrecht. At his death Pepin left his power undiminished to his son, Charles Martel (q.v.).

PEPIN THE YOUNGER (called also "The Short"), king of the Franks and the first of the Carolingians; b. about 715; d. 24 Sept. 768. He was the second son of Charles Martel, who succeeded his father, Pepin of Heristal. Martel was not only able to maintain, but so to extend his power that his two sons, Karloman and Pepin the younger, were able to share the kingdom between them, Pepin receiving Neustria and Burgundy. After his brother entered a monastery in 747, Pepin became sole ruler and having secured the deposition of the nominal king, Childéric III, in 751, by agreement

with Pope Zachery, he was proclaimed king of the Franks. Shortly after, Pope Stephen III, pressed by the Langobards under Aistulf, applied to France for aid and by a visit paid to Pepin induced him to march to Italy, where he signally defeated the Langobards, or Lombards, as they were commonly called and made the Pope a present of the lands which he had conquered from them. These lands, known historically as the "donation of Pepin," formed the nucleus of the papal states. After a second expedition to Italy, to which he was compelled by the treachery of the Langobards, he defeated the Bavarians and warred successfully with the Saxons (753-57). He was succeeded at his death in 768 by his son, Charles the Great, usually called Charlemagne (q.v.).

PEPIN LAKE, an expansion of the Mississippi River between Goodhue and Wabasha counties, Minn., and Pierce and Pepin counties, Wis., .60 miles below Saint Anthony's Falls, covering an area of 38½ square miles. It is nearly 22 miles long and two and one-half miles across at its greatest width. Its greatest depth is 56 feet, but the usual depths are from 25 to 30 feet. The lake was undoubtedly formed by a natural dam or delta deposited by the Chipewewa River, flowing in from the east. The swifter current of the latter river enabled it to bring down material too heavy for the slower stream to remove. The gorge of the Mississippi at this point must have been over 50 feet in depth. Along the shores are vertical cliffs of limestone reaching 400 feet in height and weathered into picturesque spires and turrets, and castellated battlements, and is surrounded by cliffs. On its shores are the city of Red Wing, Minn., at the head of the lake, Lake City, Minn., Wabasha, Wis., and Point au Sable, once the site of a French fortress.

PEPITA JIMÉNEZ. The publication in 1874 of Juan Valer's 'Pepita Jiménez' marks an important date in modern Spanish literature. The literary reputations of Fernán Caballero and Avellaneda were always more or less local, but Valera, poet and critic as well as novelist, was known throughout Europe and the Americas as a diplomat as well as a man of letters. 'Pepita Jiménez' was the first of a long series of novels by Valera himself, Pardo Bazán, Galdós, Pereda, and Blasco Ibáñez, which showed the world that Spain possessed a great modern novel. 'Pepita Jiménez' has met favor not only in Spain and in Spanish America, it has been translated into English, French, German, Italian, Portuguese, Bohemian and Polish. This popularity is due to the fact that it is a love story, a literary love story with a philosophical and mystical flavor to it that has endeared it to the mature reader. Valera who had been accused of attacking the Church in his treatment of his hero, Luis, maintains that he was not concerned with the fact as to whether he was more pious or less pious. He had written a work for the entertainment of his readers, and if the public has taken delight in reading his novel he has attained his goal. As a fact if Luis had not been a youth about to take orders who succumbs to the feminine charms of Pepita and gives up the Church, the author would not have had the opportunity to develop his delicate psychological study of a "cas de conscience." The whole charm of the novel lies in its religio-

mystical touch which Valera had imbibed from Luis de León and Santa Teresa, the two great mystics of Spanish literature. Valera acknowledges with graceful modesty that if there is any charm in 'Pepita Jiménez' it has come from these favorites of his whom he has despoiled to embellish his own work. Others of Valera's novels may be technically more perfect and more psychological in their character drawing, but 'Pepita Jiménez' has been the most popular both in and out of Spain. It is an exquisite example of Spanish literary art which Coventry Patmore has described as possessing "that complete synthesis of gravity of matter and gaiety of manner." In addition to the Appleton edition there is an abridged edition with notes and vocabulary by G. L. Lincoln (published by D. C. Heath and Co.) in which there is an excellent bibliography.

SAMUEL M. WAXMAN.

PEPOLI, pā'pō-lē, Giocchino Napoleone, MARQUIS, Italian statesman: b. Bologna, 6 Nov. 1825; d. Rome, 26 March 1881. He was a grandson of Murat, and in 1848 in the war with Austria, being in command of the national guards, defended his native city for some time against the Austrian troops, but upon the capitulation of the garrison was forced to flee into Tuscany. After the restoration of the Pontifical government he returned and devoted himself to the study of finance, publishing in 1856 a work on that subject. Later, in 1859, he became chief of the provincial government in Bologna. Upon the annexation of Romagna he became a member of the Left Centre of the Italian Parliament, and in 1862 was appointed Minister of Commerce, and later of the interior. From 1863-64 he was Ambassador to Saint Petersburg; from 1868-70 was Ambassador at Vienna; and from 1868 until his death in the year 1881 he was a senator in the Italian Parliament.

PEPPER, George Dana Boardman, American educator and theologian: b. Ware, Mass., 5 Feb. 1833; d. 30 Jan. 1913. He graduated from Williston Seminary, Easthampton, Mass., in 1853; from Amherst in 1857, receiving the degree of D.D. in 1882; from Newton Theological Institution in 1860, which conferred upon him the degrees of D.D. in 1866 and LL.D. in 1890. Colby University in 1867 and Amherst in 1882 gave him the degree D.D., Lewisburg University in 1882 and Colby University in 1890 also gave him LL.D. After completing his studies, he became pastor of the First Baptist Church of Waterville, Me., where he remained for five years, from there going to Newton Theological Institution as professor of ecclesiastical history, occupying that position until 1867. In 1868 he became professor of systematic theology in Crozer Theological Seminary at Upland, Pa., and served in that capacity until 1882, in which year he received a call to the presidency of Colby University. Ill health caused him to resign from his duties as president in 1889, and for three years he traveled. Upon his return in 1892 he was appointed to the chair of Biblical literature in Colby University, a position he held until 1900. He has published 'Outlines of Theology' and written numerous articles for theological reviews.

PEPPER, George Wharton, American lawyer and author: b. Philadelphia, Pa., 16 March 1867. After graduating from the University of Pennsylvania in 1887, he studied law there and was admitted to the bar in 1889. From 1893 to 1910 he was Algernon Sydney Biddle professor of law in the University of Pennsylvania. In 1915 he was Lyman Beecher lecturer in law at Yale University. On 9 Jan. 1922 he was appointed United States Senator to succeed Boies Penrose, deceased. He has written 'The Borderland of Federal and State Decisions' (1889); 'Pleading at Common Law and Under the Codes' (1891); 'Digest of the Laws of Pennsylvania, 1700-1901,' and 'Digest of Decisions and Encyclopædia of Pennsylvania Law, 1754-1898' (with W. D. Lewis 1902); 'The Way' (1909); 'A Voice from the Crowd' (1915).

PEPPER, John Henry, English chemist and mechanical inventor: b. Westminster, England, 17 June 1821; d. Leytonstone, Essex, England, 29 March 1900. He was appointed analytical chemist at the Royal Polytechnic in 1848 and in 1852 was made a salaried director of the institution, a position which he held for 20 years. He was very popular as a lecturer with the stereopticon and introduced a number of clever optical illusions. He is best known as the exhibitor of "Pepper's Ghost," the invention of Henry Dircks, but made a practical success by the ingenious stage adaptations of Professor Pepper. He succeeded in presenting on the same stage living persons and phantoms as acting simultaneously. Pepper traveled with this invention in the United States and Australia, and in the latter country accepted the position of public analyst in Brisbane, Queensland, where he remained for some years. He returned to England in 1890 and essayed a revival of the "Pepper's Ghost" exhibitions, but public interest was centred on other amusements, and Professor Pepper retired to his home in Essex. He published 'The Boys' Playbook of Science' (1860); 'The Playbook of Metals' (1861); 'Scientific Amusements for Young People' (1861); 'Cyclopædic Science Simplified' (1869); 'The True History of Pepper's Ghost' (1890), etc.

PEPPER, William, American physician: b. Philadelphia, Pa., 21 Aug. 1843; d. Pleasanton, Cal., 28 July 1898. He was the son of Dr. William Pepper, a Philadelphia physician of great repute, and professor of the theory and practice of medicine in the University of Pennsylvania at the time his more eminent son matriculated there. He was graduated from the University of Pennsylvania in 1862, and from its medical department in 1864. Beginning practice in Philadelphia, he speedily attained distinction. In 1868-70 he was lecturer there on morbid anatomy; on clinical medicine in 1870-76; and was professor of clinical medicine in 1876-87, when he was appointed professor of the theory and practice of medicine. From 1881-94, when he resigned, he was provost of the university, and under his administration the institution made phenomenal progress, the number of instructors increased from 88 to 268, the material equipment and endowment rose from \$1,600,000 to more than \$5,000,000, many new departments were added and through his efforts the university hospital was established. He founded the *Philadelphia Medical Times* and

edited it in 1870-71; was one of the founders of the Pennsylvania Museum and School of Industrial Art; through his efforts the course of study in medicine was extended to four years; and an endowment fund for the medical department was established and received a gift of \$50,000 from him on his resignation. He was medical director of the Centennial Exhibition of 1876, and for his services was made Knight Commander of Saint Olaf by the king of Sweden. He was prominently connected with the leading medical organizations of the country. He published 'Trepining in Cerebral Disease' (1871); 'Local Treatment in Pulmonary Cavities' (1874); 'Higher Medical Education' (1877); 'Phthisis in Pennsylvania' (1886); 'A Text-book on the Theory and Practice of Medicine' (1893), and several others; besides uncounted contributions to medical periodicals. He also edited the 'System of Medicine by American Authors,' regarded as the American authority on medical questions. Consult the biography by F. N. Thorpe (1904).

PEPPER, a popular name for several plants and their products. The best known is common or black pepper (*Piper nigrum*) of the family *Piperaceæ*, a native of the East Indies, whence it has been introduced into many tropical countries (especially the West Indies and northern South America, where it is an important commercial crop). The plant is a climbing shrub often more than 15 feet tall, with smooth soft stems which bear pointed, heart-shaped, leathery leaves, opposite which are spikes of mostly perfect flowers, followed by little red fruits. The plants are propagated by cuttings, which when well rooted are set near small trees over which they can spread, or in fields where poles are provided as supports. In about four years the plants commence to bear and continue to yield two crops annually for 10 years or more. As soon as the earliest berries commence to color, the whole crop is harvested to prevent loss by dropping and to retain the pungency. After drying the product is ready for market. White pepper is derived from dried black pepper by soaking in water and rubbing off the dried fleshy covering. The pungent qualities of black pepper are dependent mainly upon an acid volatile and an acrid resin. Meleguetta or Guinea pepper is derived from species of the families *Anonaceæ* and *Zingiberaceæ*; and Jamaica pepper or pimento from the family *Myrtaceæ*.

The red peppers of the temperate zones are various species of *Capsicum*, particularly *C. annuum* and *C. frutescens*, the former an annual herb, the latter a shrubby perennial. The former is the parent of the peppers of Northern gardens; the latter, being slower in its growth, is found only in the South. The species are all natives of tropical America, where they were cultivated for condimental uses prior to the landing of Columbus, who took specimens back with him to Europe. It seems, however, to have been introduced into European gardens by way of Africa. In the South the fruits, green or ripe, are very popularly used as a condiment and for mixing with pickles. Some varieties are used for special purposes; for example, the little-fruited sorts, which are ground to make Cayenne or red pepper, and the Tabasco variety, which forms the basis of Tabasco sauce.

The green peppers of Northern markets are merely immature red peppers. They are used for salads and for making "mangoes," the contents being removed and chowchow pickles put in their place. Olives are often stuffed with minced pepper which has been steeped in olive oil. The plants are grown from seed started under glass and transplanted to the field after all danger of frost has passed. They require a fairly light, rich soil, plenty of sun and a warm season. Their insect enemies are the same that attack the egg-plant.

PEPPER GRASS, See CRESS.

PEPPER-POT, a prepared food common in the West Indies, of which cessareep (q.v.) is the principal ingredient, together with fresh or dried fish and vegetables.

PEPPER-ROOT. See DENTARIA.

PEPPER-TREE, PERUVIAN MASTIC-TREE, or PEA-TREE, several species of the genus *Schinus* of the family *Anacardiaceæ*. Only two of the 20 species are cultivated. In California they are popular as far north as San Francisco. *Schinus molle* is the commoner species. It is an evergreen tree 20 or more feet high with rounded top, pendulous branches and yellowish-white flowers in conical panicles followed by fruits about the size of peppercorns. The narrow leaves are rich in a resinous fluid which they discharge into the air especially after a rain when the tissues become turgid. Next to the blue gum tree (*Eucalyptus globulus*) this has been the most popular ornamental tree, but owing to its acting as a harbor for scale insects, etc., it has suffered in orange-growing districts, thousands of trees having been cut down because of this.

PEPPER-WOOD, a popular name for *Xanthoxylum clava-Hercules*, also known as "Hercules Club," and Toothache tree. It is a very spiny tree of shrubby size and growth, growing in coast lands from Virginia to Florida, and westward to Texas and Arkansas. It has been called erroneously southern prickly ash, and under this title its bark is found in commerce for medicinal use. See XANTHOXYLUM.

PEPPERELL, pĕp'ĕr-ĕl, SIR William, American colonial general: b. Kittery Point, Me., 27 June 1696; d. there, 6 July 1759. He joined his father in business as a merchant and the firm was for many years the largest mercantile house in New England. He ultimately became sole owner of most of the towns of Saco and Scarborough, and held large properties in Portsmouth, Hampton and other places. In 1722 he was elected colonel of the Maine militia; and in 1727 was elected one of his majesty's council for the province of Massachusetts, and was regularly re-elected for 32 years in succession. Living on an exposed frontier, where the inhabitants were constantly engaged in warfare with the savages, a large portion of his life was spent in the camp. When the expedition against Louisburg was undertaken, the governors of New England gave him the command of the troops. Beginning the siege in May 1745, he compelled the city to surrender on 16 June, and in reward for his services was made a baronet. In 1755 he was commissioned a major-general in the British army, and given command of forces protecting the frontier of

Maine and New Hampshire. From 1756 to 1758 he was acting governor of Massachusetts. In 1759 he was appointed lieutenant-general. His grandson was created a baronet in 1774, and embraced the royal cause during the Revolutionary War, in consequence of which his estates were confiscated. Consult Parsons, U., 'Life of Sir William Pepperell' (Boston 1885); Parkman, F., 'A Half Century of Conflict' (Boston 1892); Brooks, C., 'Sir William Pepperell' (Boston 1903).

PEPPERELL, Mass., town in Middlesex County, 35 miles northwest of Boston, on the Nashua River, and on the Boston and Maine Railroad. The Lawrence Library and the Wolcott monument are located here. The town has manufactures of paper and cards and owns the water-supply system. Pop. 2,953.

PEPPERIDGE, a popular name in some localities for *Nyssa sylvatica*, which is known also as tupelo, black gum and sour gum. See TUPELO.

PEPPERMINT. "Mint" was among the plants first recognized as of value by the ancients, and many interesting references to it are found in the earliest known literature. Its extreme antiquity is evidenced by the fact that it was known in Greek mythology, where it was given a birth both romantic and divine in connection with the loves of the gods. "Mintha" (*Μινθη*), a beautiful girl, had won the affections of Hades, and in a fit of jealousy was transformed by Ceres into the plant which was then given her name, from which followed the Latin "*Mintha*," "*Mentha*," and "*Menta*." There still exists under this name in Pylos, Greece, *Mount Mintha*, upon which the transformation occurred. At the base of the mountain was in ancient times a grove dedicated to Ceres and a temple to Hades. This romantic tradition is recorded by Strabo (*Geographia*, liber VIII), Julius Pollux, and others.

Hippocrates, the most celebrated physician of antiquity, b. about 460 B.C., mentions the virtues of mint, and also says "It excites to love." Aristotle, b. 384 B.C., describes its well-known beneficial effects upon the human system, and Theophrastus, his successor, in his 'History of Plants,' also mentions its various virtues in a most interesting way under the newer name which had been given it of *ῥόδισμον* (fragrant, or sweet-scented). This name is also used in both the Greek gospels, which record the well-known utterance of Jesus, from which we learn that taxes were annually paid in this plant, indicating that it had already become an article of regular commerce.

A very interesting account of mint is given by Pliny (23-79 A.D.) in his 'Historia Plantarum' (liber XIX, cap. 8), where he mentions the methods of propagation, its use in banquets, etc., and its various medical virtues. Ovid also speaks of its having "magical power." Much prominence is given to its virtues in the writings of the great physicians of antiquity, including Galenus, Avicenna, Celsus, etc.

Commercial History.—There are many species of the genus *Mentha* noted by various writers, but by far the most important and the only one cultivated or distilled in a large commercial way in Europe or America is the true peppermint plant, *Mentha piperita*. The regular cultivation of this plant in a commercial

way began in Surrey, England, about 1750, where at that time only a few acres were devoted to medicinal plants. Fifty years later about 100 acres were under cultivation. The growers, having no distilleries of their own, sold their plants to London chemists who were engaged in distilling other products as well; but afterward distilleries were built at the sources of production to save transportation expenses. The industry in England reached its maximum about 1850, the area under cultivation being about 500 acres, after which it began rapidly to decline owing to the growth of the American industry.

The inception of the industry in America occurred in 1816, in Wayne County, N. Y., which for a number of years was the chief producing centre of the world, but in the year 1835 it was inaugurated in Michigan, a region, with soil of extreme fertility, under climate conditions especially favorable, which soon became the chief producing centre of the world, a position it has since maintained. It is accordingly of interest to note that over three-fourths of all the true peppermint of the world is produced within a radius of 75 miles of the city of Kalamazoo. Besides the climatic advantages and fertile soil of Michigan, radical improvements were effected here in the apparatus for distillation, implements of cultivation, etc., enabling the process to be conducted with far greater rapidity, and materially enhancing the quality. The business, which had hitherto been in a crude state, now began to assume a more systematic form.

Peppermint, as is well known, is cultivated chiefly for its "essential oil," in which are secreted the aroma and virtues of the entire plant. This exists in minute cells in the leaves and blossoms. Distillation is effected by placing the plants, which have been harvested and dried, in large vats, thoroughly packed and closed with air-tight covers, steam being admitted to the bottom of these vats by means of pipes and valves. The oil cells are ruptured by the heat, the oil escaping upward with the current of steam. The steam thus impregnated with oil flows through condensers where it is converted into oil and water, from thence flowing into the "receiver," where the oil, which is lighter, floats upon the top, while the water settles below and is again forced into the boiler to be reconverted into steam for successive charges.

The product thus obtained is the crude or "natural" oil; but this although "pure" contains some resin extracted from the stems, and some approximate hydrocarbons. The quality is consequently greatly improved by an intelligent "fractional distillation" by which the objectionable properties may be separated, the refined product being the "quintessence" of the plant, with a rich and mellow aroma.

The soil now mostly used for mint culture is formed by the deposit during many centuries of the decay from aquatic plants, forests and other vegetation growth in the beds of ancient lakes. Being soft and porous, it is necessary to provide the horses with "mud shoes," which are fastened to their hoofs to prevent sinking.

The essential parts of a distillery are a boiler for generating steam, a series of vats for containing the plants and a condensing apparatus, these all being connected by a system of pipes,

valves, etc. Auxiliary to these in the larger "stills" are engines, steam cranes, etc., for economizing labor. While the first distilleries had a capacity of only five pounds per day of oil, the distilleries of the most modern type and installation have a daily capacity each of 400,000 pounds of plants, yielding about 1,500 pounds of oil. Much of the labor formerly done by hand is now accomplished by steam and other forms of power.

The production in America of peppermint during the past 10 years has averaged annually about 60,000,000 pounds of plants, yielding between 150,000 and 400,000 pounds essential oil. About half of the entire production is used in America, the other half being exported to foreign countries. An oil sold as "Peppermint" is distilled largely in Japan, which, however, is not produced from the true peppermint plant, but from *Mentha arvensis*, and is inferior in flavor, etc.

Peppermint in the pure state is highly agreeable and beneficial and its consumption is rapidly increasing, owing to the new uses which have been found and an increased demand for those purposes to which it has long been applied; its chief use being in medicine, confectionery, chewing gums, toilet articles and fine pharmaceuticals.

PEPSIN, a group proteolytic enzyme or a ferment believed by some to be secreted by the mucous lining of the stomach. By other investigators it is held to be a product of an antecedent substance called pepsinogen with hydrochloric acid. It has never been prepared in the pure state, but it is believed to be of a proteid nature. When present in a feebly acid solution, at a temperature approximately the same as that of the human body, from 98° to 105° F., pepsin possesses the power of splitting proteins into metaproteins, proteoses and soluble peptones, and thus rendering them capable of absorption in the alimentary canal. This action is greatly enhanced by the presence of one-twentieth of 1 per cent of hydrochloric acid. Owing to this remarkable power, pepsin is a highly important agent in the chemistry of digestion, and it is very commonly administered, in medicine, when the quantity secreted by the stomach is deficient. It is rendered inert by alkalis and recovers very slowly. A moist heat of 200° F. destroys its power. The commercial supply of pepsin is obtained from the stomachs of hogs, sheep or calves, and its digestive power varies considerably. When extracted with glycerine for 12 to 24 hours, the product is pepsinogen. A solution containing two grains of pepsin in one ounce of water, and acidified by the addition of five minims of hydrochloric acid of specific gravity 1.16, should dissolve at least 100 grains of the white of hard-boiled egg in 30 minutes, if the egg is finely divided, and the mixture is kept at 125° F., and constantly stirred. The total solvent power of pepsin is much greater than this, however, and in normal digestion one grain of pepsin probably dissolves as much as 3,000 grains of coagulated albumin. Specimens of pepsin have been prepared which have dissolved as much as 25,000 times their own weight of coagulated proteid, and some authorities are of the opinion that pepsin is theoretically capable of exerting its peculiar powers indefinitely, without being itself destroyed in the process. There is evidence

that pepsin is reabsorbed by the alimentary canal to a considerable extent, and returned to the secreting glands of the stomach for repeated use; and it has also been detected in the muscles and in the urine. The pepsin of commerce is an amorphous powder, of a yellowish-white color; but the substance is also administered in the form of elixirs and in many other ways. When kept dry and at a temperature not above 100° it retains its properties indefinitely. It is used, not only as a digestive corrective, but also for effecting the solution of various superficial necrotic tissues, such as diphtheritic membranes. Its existence was first recognized by Schwann (1836) and Wasmann (1840). Consult Hawk, P. B., 'Practical Physiological Chemistry' (Philadelphia 1913); Mathews, A. P., 'Physiological Chemistry' (New York 1915).

PEPYS, pēp'is, pēps, or pīps, **Samuel**, English diarist: b. at Bampton, 23 Feb. 1633; d. London, 26 May 1703. He was educated at Saint Paul's School and Magdalen College, Cambridge, and early acquired the patronage of Sir Edward Montague, afterward Earl of Sandwich, who employed him as secretary in the expedition for bringing Charles II from Holland. On his return he was appointed one of the principal officers of the navy, in which, through his high favor with the king, he introduced many reforms. In 1673, when the king took the Admiralty into his own hands, he appointed Pepys secretary to that office. He was employed under Lord Dartmouth in the expedition against Tangier, and often accompanied the Duke of York in his naval visits to Scotland and coasting cruises. During the excitement of the Popish plot he was, at the instigation of the Earl of Shaftesbury, committed to the Tower on an unfounded charge of aiding in the design to dethrone the king and extirpate the Protestant religion, but was presently discharged without a trial, and reinstated in his office at the Admiralty, which he held until the abdication of James II. On the accession of William and Mary he resigned his office and devoted himself to publishing his 'Memoirs' (1690), relating to the navy for 10 years preceding, and led a retired life from this time till his death. Besides being a recognized authority on naval affairs, he was well versed in history, architecture, painting and sculpture. He was president of the Royal Society in 1684-86. He left a large collection of manuscripts to Magdalen College, Oxford, known as the Pepysian Library, and consisting of naval memoirs, prints and five large folio volumes of ancient English poetry, begun by Selden, and carried down to 1700, from which Bishop Percy made numerous selections for his 'Reliques of Ancient English Poetry.' His unique 'Diary' (begun 1 Jan. 1660 and ending 31 May 1669, on account of defective eyesight) affords a curious picture of past manners and particulars of the Stuart court. It was written from day to day in a sort of shorthand which was deciphered by the Rev. J. Smith, and first published under the editorship of Lord Braybrooke in 1825. Fuller editions have since been published, the fullest being that of H. B. Wheatley (1893). Consult Wheatley, 'Samuel Pepys and the World he Lived In' (1880); Stevenson in 'Familiar Studies' (1892).

PEPYS' DIARY. Samuel Pepys' diary is a minute daily chronicle for about 10 years (1659-69) of the life of a young man in his 20's and 30's engaged in important public office during the momentous period of the restoration of the Stuarts to the throne in England. It reveals with complete frankness the most intimate details in the personal, family and official life of the author; his relations with his wife, relatives, friends, patrons and servants; the shifts by which he acquired over £6,000 in six years of government service, the back-stairs gossip and political wire-pulling of Whitehall, and his own manoeuvres in the Navy Department; his weakness for drink, fine clothes and playhouses, his resolutions to abstain therefrom, his backslidings and consequent regrets; his salacious interest in ladies of easy virtue at court and elsewhere, all the life of London as it came under his shrewd eyes in the public places of the time. It was with keen regret that, owing to growing weakness of sight, he desisted from keeping his record. Its charm rests partly upon the concreteness with which he sets down his experiences and impressions, but also on his point of view. His morals, decent enough for a thriving middle class official of the time, differ somewhat from ours, but not so much as to put us out of sympathy with him. He writes out the minutest motions of his own nature, all the petty feelings, vanities and virtues that most men feel but seldom acknowledge and never mention even to themselves. Consequently to read Pepy's diary is to undergo a series of those pleasurable little shocks which make the charm and zest of racy gossip about people we ourselves know. Much of this amusement is at Pepys' expense, a fact likely to make us forget that he was really a person of consequence in his day. Beginning as a kind of clerk, he became the most useful man in the Navy office, capable, industrious, determined and for the age not unusually corrupt. He suffered from some political vicissitudes, was ousted from his position, but gained others, and sat in Parliament. He figures in later years as rather more than an acquaintance of artists and writers like Kneller and Dryden and as a collector of books. The manuscript of his diary, written in cipher, was left ultimately with his library to Magdalen College. It was not published, and then but in part, until 1825. A full edition appeared in 1895.

WILLIAM HALLER.

PEQUOT, pē'kwōt, Conn., the name of a former Indian fort on Pequot Hill, an elevation 180 feet above sea-level in the eastern part of the town of Groton, and eight miles north-east of New London, Conn. (q.v.).

PEQUOT INDIANS, a tribe of North American Indians at one time an integral part of the Mohegan tribe and of the Algonquian family. In the early part of the 17th century they occupied a narrow strip of the coast of New London County from the Niantic River to the boundary line of Rhode Island, where London, Groton and Stonington now stand. At their zenith they numbered upward of 3,000, were warlike and powerful in the country round the Thames River when Connecticut was first settled, and made treaties with the Dutch and English. Hostilities broke out with the whites in 1637, and the tribe was cut to pieces

and scattered. Some fled to Long Island, where a few remained, but most of these with the larger part of the tribe were distributed among the Mohegan, Narragansett and Niantic tribes, where they had their own villages but were forbidden to use their tribal name. A few descendants may be found at Green Bay, Wis., and a few may still be found in the old Groton tract.

PEQUOT WAR. See COLONIAL WARS IN AMERICA.

PERAK, pā-rāk', one of the federated Malay states, under British protection, lying between 3° 37' and 6° 5' N., and between 100° 3' and 101° 51' E. on the west coast of the Malay Peninsula, north of Selangor, south of Siam and Kedah and west of Pahang, Kelantan and Petani. Extreme length, 172 miles; extreme breadth, 100 miles; coast line, 90 miles; area, 7,800 square miles, including the 1,000 square miles recently conveyed to Perak by Siam. The region is crossed by two parallel ranges. Between them lies the Perak River, the only navigable stream in the country; steamers go up it 40 miles, and trading boats 200 miles. The climate is very damp, the annual rainfall being 223 inches. The climate is hot on the coast and the river plains, and much cooler in the mountains; the mean temperature along the coast is 87° F. by day and 78° by night. The total area of land occupied is (1913) 850,824 acres—142,649 in rubber; 90,644 in cocoanuts; and 85,513 in general agriculture. Sugar, tobacco and rice grow in the plains; tea, coffee and vanilla in the uplands. Opium is extensively grown and the rubber plantations in 1913 covered 60,000 acres in the Kiuta district alone, and 19,500 trees were tapped. The exports of copra are large, amounting to a value of \$800,000 annually. The forests are under the control of the government and systematic reforestation with valuable cabinet woods is carried on. The forest reserves in 1913 covered 288,451 acres—about 6 per cent of the whole area of the State. Irrigation is practised increasingly, the government appropriation in 1913 being \$130,600. The principal acreage watered is the 70,000 acres of rice fields. The irrigation canals also carry the water supply for the districts traversed. Deer, snakes, leopards and elephants are found in the hills, and there are crocodiles in the rivers. The mineral resources are great. Tin is the metal of largest value. It is found everywhere throughout the State, on the tops of the highest mountains and in the soil of the river swamps. The centre of the tin-mining industry is the Kiuta Valley, 30 miles long and 12 miles broad. For the year 1913 (the latest records published since the outbreak of the war) the exports of tin amounted to a value of \$27,866,186. Tungsten ore (wolfram) and gold were also exported in small quantities. Silver, lead, iron, copper, zinc, arsenic and titanium are also found. A railroad connects the centre of the mining district, Kiuta, with Kuala Kangsar, and this road is being extended to Wellesley. There are also 776 miles of metaled roads in the State and 19 permanent road bridges. There are 204 government schools and 18 others under government inspection. The enrolment is 13,563, and the average daily attendance, 81.32 per cent. The exports for 1913 totaled \$40,542,615 and

consisted of principally tin, rubber, copra and rice. The imports were valued at \$19,468,032 and were chiefly opium, tobacco and cigars, iron ware, machinery, petroleum, cotton goods and cattle. The population by the 1911 census was 494,057; more than two-thirds being males, owing to the preponderance of Chinese miners. There is continual immigration from China and India, so that the Chinese far outnumber the Malays.

Perak was long ago settled by the Malays. The Dutch made a settlement by treaty in 1650, but were repeatedly driven out by the natives and in 1795 by the English, who in 1824 made a treaty with Siam by which Perak's independence was recognized in spite of Siamese conquest in 1818. In 1874 British intervention was asked by one of the native sultans; a year later the British resident was murdered; the resulting punitive expedition brought the country under British protective control, though Perak was still nominally independent. Perak joined the Federation of the Malay States in 1895-96.

PERCEFORÉT, pars'fo-ra, French legend giving the history of Britain before the days of King Arthur. It was first printed in 1528 in Paris and is supposed to have been composed about the 13th century. According to the work King Perceforét visited Britain with Alexander the Great and was made king. The work is unlike the later romances of chivalry in that it deals with enchantments, visions and superstitions rather than doughty deeds in battle. It was very popular in the Middle Ages and is valuable to-day for the insight it gives us of life as it was lived in mediæval times.

PERCEPTION. In its psychological meaning, perception is the direct conscious apprehension of physical objects and events through the medium of the senses. Thus one perceives trees, animate objects, one's own body, rhythms, harmonies, progressive movements, etc. By some psychologists the term perception has been rigidly interpreted as simply the sensation or sense testimony, and all thought activity aroused by the excitement of the senses as being a distinct mental process termed ideation. By the larger number, however, perception is regarded as including cognition. Thus, one sees a tree, but also recognizes it as an oak tree, and perhaps, still further, as a white-oak tree. The perception is evidently inclusive of the cognition that the tree is of the family of the oaks, and of the variety white-oak. In another more complex phase, one may look down a long stretch of railroad track and "see" a minute blackish dot capped with a tiny white cloud. That is the sense testimony; but it is obvious that the perception is that a train is approaching. We perceive not the dot and the cloud, but the train. Hence it is held that perception includes recognition. Perception is frequently contrasted with ideation in which the object is "thought" or "imagined," but not seen or heard or handled. Although the objects of perception are innumerable, and the sensory materials involved of great variety, the forms of perception, that is, the ways in which sensations are interwoven and compounded, are reducible to three primary types; one form or pattern underlying spatial perception, a second underlying the perception of temporal

sequence and order, and a third furnishing a basis for the apprehension of the qualitative nature of things. The perceptual consciousness is constantly undergoing, both in the individual and in the race, elaboration and refinement. For, in the individual, experience is continually investing the apprehension of objects with new shades of meaning and, in the animal series at large, evolutionary processes have modified and are still modifying both the structures and functions of the nervous system and the external organs of sense.

Inasmuch as perceptual knowledge comes by way of the senses, the most obvious mode of classification is by reference to the various sense-departments. This plan of classification would yield one large group of visual perceptions, another of auditory, a third of tactual, and so on through the senses. It would include, also, perceptions in which more than one sense-department is involved. Sight mediates the largest number of perceptions. The primary function of vision is the apprehension of *objects*; the primary function of audition, the apprehension of *events*. Vision, in conjunction with tactual and kinæsthetic sensations, gives us our spatial world — objects which are of various sizes, colors and shapes, which occupy various positions and offer, to each other and to the experiencing individual, varying degrees of resistance. The ear is less well equipped than the eye for spatial perception. It is only by aid of the eye and of the skin, tendons and muscles that sounds acquire definite spatial characteristics. But hearing is rich in qualities, the normal ear distinguishing several thousand tones and noises; and it is also quick to detect rapid and complicated changes in the environment. The three chief functions of the ear are the perceptions of human speech, of music and of the sounds of nature. Tactual perceptions, that is, perceptions mediated by nervous organs lying within the skin, inform us — though not so accurately or so minutely as visual perceptions do — of the spatial characteristics of objects; their size, position, form, etc. They also acquaint us with the texture (roughness, smoothness, bluntness) and the temperature of objects, and with the condition of the skin itself (whether wet or dry, irritated or bruised). When reinforced by sensation-elements from muscles (muscular pressure), tendons (tendinous strain) and joints (articular pressure), tactual sensation-complexes furnish knowledge of the weight, resistance, extent and movement of objects and of the position and movement of the observer's own body. The perception of bodily orientation is aided by a specific quality of sensation set up within the semi-circular canals of the ear. Finally, tactual factors, pressure, temperature and pain, in co-operation with sensations of taste and smell, bear information regarding the nature of food and other substances placed in the mouth. Olfactory sensations serve, by themselves, to acquaint the individual with the nature of odorous substances. The perception of the state of the large organs within the body is mediated, for the most part, by sensations set up in these organs themselves; for example, the stomach, heart and lungs.

Perceptual knowledge is by no means infal-

lible. Its ambiguities and inaccuracies are termed illusions. They may arise when an object is perceived under varying conditions (for example, a stick looks longer in a vertical than in a horizontal position) or when a perception falls into conflict with the results of objective measurement or of some other standard of knowledge (for instance, a filled right angle seems to contain more than 90°). Certain illusions are ineradicable factors of normal experience; others—as illusions of insanity—rest upon derangement of mental function. Hallucination is generally considered to be a more serious derangement of perception than illusion. The hallucinatory object either does not exist at all—as in certain deliriums—or it exists in quite a different form from the actual object; for example, the mistaken apprehension of subjective noises as human speech. The perceptions of the dream-consciousness may be considered as hallucinations of a normal type. Consult Angell, J. R., 'Psychology' (New York, 1904); James, W., 'The Principles of Psychology' (New York 1913); Titchener, E. B., 'A Text-Book of Psychology' (2 vols., 1909-10).

PERCEVAL, pər'si-vaɪ, **Spencer, Rt. Hon.**, English politician: b. London, England, 1 Nov. 1762; d. there, 11 May 1812. He received his early education at Harrow and was graduated from Trinity College, Cambridge, in 1781. He studied law, was admitted to the bar and rose rapidly in his profession, attaining a high reputation as a constitutional lawyer. In 1794 Lord Chatham made him counsel to the Board of Admiralty. In 1795, Pitt offered him the Chief Secretaryship for Ireland but he candidly declined it. In 1796 with the aid of Pitt he was returned to Parliament for Northampton and there proved himself an eloquent speaker and a quick and keen debater. In 1801 he was solicitor-general, in 1802 attorney-general. On the decease of Cox in 1807, he was appointed chancellor of the exchequer, in which office he continued until 1809 when, upon the death of the Duke of Portland, he succeeded him as First Lord of the Treasury and became Premier. This office he held until his assassination at the door of the House of Commons by a man named Bellingham, who declared that he had slain him by mistake for Lord Leverich Gower, with whom he had a grievance. Consult Williams, 'Life and Administration of the Right Honorable Spencer Perceval' (1856); Walpole, 'Life of Spencer Perceval' (1874).

PERCH, a popular name, used with some specific qualifying word for a variety of spiny-rayed fishes; but generally and properly applied to species of the genus *Perca* of which about 90 species are known, most of them American. The name "white perch" is erroneously but commonly given to *Morone interrupta* described below. These fishes belong to the families *Percidæ* and *Serranidæ* respectively. The yellow perch (*Perca flavescens*), known in many localities as "yellow Ned," ringed perch, etc., is very closely related to the *Perca fluviatilis* of Europe, with which many zoologists consider it to be identical. It may be recognized by the possession of two spines before the anal fin, the well developed pseudo-branchiæ, the absence of canine teeth on the vomer and jaws and the

distinctive colors, which are olivaceous above, golden yellow with six or eight dark vertical bands on the sides and the pectoral and ventral fins orange or red. It reaches a length of one foot and a weight of two pounds, but generally does not exceed one pound. This well-known and deservedly popular fish abounds in the fresh waters of the eastern United States, descending coastwise streams to the brackish waters of bays and inlets, in which it attains a large size and excellent quality. It is especially abundant in the Great Lakes and is common in the lakes and streams of the upper Mississippi Valley; but is not found in the lower Mississippi and its tributaries, nor on the Atlantic Coast south of North Carolina. Recently it has been introduced, through the United States Fish Commission, in western lakes and streams from which it was formerly absent. The yellow perch prefers slow-running streams, ponds or lakes with sandy or gravelly bottoms; and is to be sought in the deeper holes under shaded banks, about mill-dams, bridge-piers, sunken timbers and in eddies. It is gregarious and a noteworthy circumstance is that each school is composed of fish all of one size—be they large or small. Like several other fresh-water fishes they become inactive in very cold weather and conceal themselves in holes. In the spring they assume brighter hues, the reddish parts becoming deeper in tint as the spawning season approaches. The eggs are about 1/12 inch in diameter, and are remarkable for their adhesive quality and the manner of deposition in strings or bands which sometimes reach a length of seven feet, and a width of three or four inches. They are laid from February to May, according to locality. The favorite food of this fish consists of minnows and other small fishes, which they pursue with relentless vigor; but they also eat many kinds of worms, insects and their larvæ, etc. Though not of superior quality yellow perch is esteemed as a panfish and is shipped to the principal markets to an annual value of several hundred thousand dollars. The principal fisheries are on several of the eastern rivers, and especially the Great Lakes, where they are taken in large numbers in various kinds of traps and set-nets.

The white perch (*Morone americana*) belongs to the family of the sea-basses and rock-fish (*Serranidæ*). It has three spines before the anal fin, and the two dorsal fins are united, with very strong spines in the anterior. The color is olivaceous above, silvery white on the sides and belly, marked with faint longitudinal streaks. In length it is usually about nine inches and its weight is about half a pound. A few specimens weighing up to two pounds have been caught in Connecticut waters. This species is exceedingly abundant along the coast from Nova Scotia to South Carolina, in the brackish and fresh waters of estuaries and rivers, and is found landlocked or introduced in many fresh-water ponds. It appears to be somewhat migratory, the schools remaining in brackish water during the winter and ascending the rivers in the spring. They usually spawn about May—about 40,000 small, clear, semi-buoyant and separate eggs being deposited by each female on regular spawning grounds. Their food resembles that of the yellow perch, but they show a preference for shrimps and other crustaceans.

Both of these perches are favorites with anglers and may be caught with live bait and the simplest of tackle; but the finest sport is afforded by the use of a trout rig with either bait or artificial fly. (See also PIKE-PERCH). Consult Goode, 'American Fishes' (New York 1888); Henshall, 'Bass, Pike, Perch and Others' (New York 1903).

PERCH, POLE, or ROD, a measure of length used in surveying land, equal to $5\frac{1}{2}$ yards or $16\frac{1}{2}$ feet. Surveyor's chains are usually four perches or 66 feet in length. A square perch is $30\frac{1}{4}$ square yards, and 160 square perches make an acre. In masonry a perch is a cubic measure, signifying a form $16\frac{1}{2}$ feet long, $1\frac{1}{2}$ feet high, and 1 foot thick. It contains $24\frac{3}{4}$ cubic feet.

PERCHED BOWLDERS. See ROCKING STONES.

PERCHERON (pĕr-shĕ-rŏn) **HORSE**, a breed of heavy horses perfected in the province of La Perche, in northcentral France, a long time ago. They were first brought to America in 1839. It has Arabian characteristics imparted to a large, bony frame, giving a very strong and durable draught-horse, rarely less than 15, and often 16 hands high, and weighing from 1,500 to 2,000 pounds. Many stallions of this breed have been imported into the United States, and have influenced favorably the work-horses of the country. As the heavier type was desired to mate with the light-weight mares of this country a heavy draught horse has been the development here whereas in Europe a heavy coach horse was developed. The Percherons in America make excellent farm horses of quick, alert action and great strength. They are stocky and easy keepers, and of great endurance. There are said to be over 30,000 registered Percherons in the United States.

PERCHLORIC ACID and PERCHLORATES. Perchloric acid, HClO_4 , is prepared by the careful distillation of a mixture of powdered potassium perchlorate and four times its weight of concentrated sulphuric acid; the product being purified by repeated distillation in a vacuum. The water-free acid is a heavy, colorless, syrupy liquid, specific gravity 1.8 soluble in water with evolution of heat, can be distilled without decomposition at 102°F . under diminished pressure. At a temperature of 230° white fumes are evolved and pure perchloric acid comes over. By continuing the distillation the liquid gradually becomes a white crystalline mass. It unites with the moisture of the air emitting dense white fumes of the hydrate, $\text{HClO}_4 \cdot \text{H}_2\text{O}$. This hydrate when heated decomposes into pure acid which distils over, and an aqueous acid which boils at 203° and is left behind in the retort. It is a strong monobasic acid resembling sulphuric acid in many of its physical and chemical properties. Iodine dissolves in it, producing a yellow crystalline substance, with the formula $\text{HI} \cdot \text{O}_3$. If distilled at a low pressure perchloric acid assumes a brownish color, similar to bromine, and explodes. It is also very apt to decompose with explosive violence when brought in contact with anything of an organic nature as paper, wood, charcoal, etc. Burns on skin produce wounds which do not heal for months. It forms a number of salts, the most important being potassium perchlorate and sodium perchlorate. Potas-

sium perchlorate is made by the careful application of heat to potassium chlorate which decomposes, giving off oxygen and a mixture of potassium perchlorate and potassium chloride. It is then dried, powdered, well washed and heated gently with hydrochloric acid as long as chlorine and chlorine peroxide are evolved; and again washed. It is a colorless crystalline body, rather difficultly soluble in water, and differs markedly from the free acid in being very stable, decomposing only at a high temperature to oxygen and potassium chloride. Perchlorate of soda is found in small quantities in Chili-nitrate.

PERCIER, pâr-sĕ-â, **Charles**, French architect: b. Paris, 22 Aug. 1764; d. there, 5 Sept. 1838. He was a pupil of A. F. Peyre, in 1786, won the *premier grand prix de Rome*, during the Revolution designed furniture and decorations and by the antique motifs which he introduced from Pompeii and Rome, may be said to have begun the "Empire style" so widespread in Europe in the early 19th century. From 1794 to 1814 he worked in collaboration with Pierre Fontaine (q.v.), with whom he continued the decoration of the Paris Opera, restored the Louvre colonnade and completed the upper story of the buildings about the court, built the theatre and chapel of the Tuileries, and designed the Arc de Triomphe du Carrousel, and the grand staircase of the Museum. Napoleon made him a chevalier of the empire. Among his writings are 'Restauration de la Colonne Trajane' (1788), and 'Choix des Plus Célèbres Maisons de Plaisance de Rome et de ses Environs' (1809-13).

PERCIN, **Alexandre**, French general: b. Nancy, 1846. He served in the Franco-Prussian War 1870-71, and attained the rank of captain. He became brigadier-general in 1900 and major-general in 1903. In 1893 he was appointed director of the Saint-Etienne arms factory and was made a member of the Superior Council of War in 1908. In the first weeks of the European War General Percin held a prominent command, but was retired by General Joffre for reasons which were not made public. He was a frequent contributor to periodical literature on military subjects.

PERCIVAL, **James Gates**, American poet and geologist: b. Kensington, Conn., 15 Sept. 1795; d. Hazel Green, Wis., 2 May 1856. He was the second of three sons of Dr. James Percival. At the age of 16 he entered Yale College; when 20 he stood at the head of his class, which included the poet John G. Brainard, statesmen John M. Clayton and Thomas A. Marshall, and author Rev. Wm. Buel Sprague, and was graduated as bachelor of arts June 1815. He early showed a strong predilection for the writing of verse, but devoted himself to the study of medicine also. At the age of 25 he published his first volume of poems. Then, having received the degree M.D., and being in feeble health, he went to Charleston, S. C., where he began to publish a periodical entitled *Clio*, which failed after two issues. He gave this name later to one of his books of verse. In the year 1824 he was appointed professor of chemistry at West Point and was also appointed United States physician there. He resigned after a few months. He never again attempted to follow the practice of medicine,

but continued to write verse and studied assiduously in geology and the allied physical sciences. During the year 1825 he published a second volume of poems, which was republished in London. After leaving West Point he drifted about and soon became assistant of Noah Webster in publishing 'Webster's Dictionary,' in which his knowledge of many languages proved invaluable. Having been appointed assistant State geologist of Connecticut, in 1836, he continued in that capacity until the year 1842, when he issued an elaborate report on the work of his department. The next 10 years of his life were passed in poverty and ill health. In 1853 he was employed by the American Mining Company to examine into and report upon its mines in Wisconsin. After he had finished that work in 1854 he was appointed by Governor Barstow State geologist for Wisconsin, which place he filled until his death, having made one report, and died during the time he was preparing his second. Percival was a linguist and scholar and wrote poems in Danish, German, Italian, Latin and Greek. As a geologist he ranked with Hitchcock and Comstock as the foremost of their time. He translated from the French, Malta Brun's *Geography*, published in 1843. In religion he was a Universalist; in politics, an Abolitionist. All his poems show an artistic finish, and several of them are entitled to a high place among the classic literature of the English language. His 'The Deserted Wife' has run through school-readers and has been recited upon many a rostrum. 'Prometheus' was his greatest effort, and, no doubt, one of the best of all his works.

PERCUSSION, in medical technics, that method of investigation which consists in tapping on the surface of the body, to ascertain from the sound produced the condition of the parts lying beneath. It forms a principal branch of modern medical diagnosis. Anatomy teaches how the organs enclosed in the cavities of the body are normally formed, whether they are firm or spongy in texture, whether they are full or empty of air, whether they are tense or lax, etc.; and, according to these distinctions, a slight blow upon the surface over them will evoke variations of sound, dull where the underlying substance is solid; resonant where it is more or less hollow. Thence by a comparison of the sounds emitted on percussion with the information furnished by physiology as to the position and structure of any particular organ, and by pathology as to the morbid changes to which it is liable, an idea more or less distinct is obtained of the actual condition of the organ and of the nature and extent of any disease which may be acting upon it. In a technical point of view percussion is either immediate or mediate. In the former a stroke is given with the ends of the fingers on the part of the body, either bare or slightly covered, which is to be examined; in the latter an intermediate substance, as a firm elastic plate or body of ivory, wood, gutta-percha, etc., called a pleximeter, is placed on the part in question, and the stroke is given on it either with the fingers or with a percussion-hammer. As ordinarily practised, one or two fingers of the left hand are laid firmly against the part, and sharp raps are made with the end of the middle finger of the right hand. Much depends on the way in which the

stroke is given, as its force and elasticity, as well as its direction, have much influence on the sound. It was introduced in 1761 by the Vienna physician, Auenbrugger (q.v.). Ignored by the profession in Austria, it was brought again into notice by its advocacy by Corvisart in 1808. The practice of it has extended throughout the medical world. Mediate percussion was invented by Piorry in 1828, and it has been carried to the highest perfection by Skoda and his pupils. See **AUSCULTATION**.

PERCY, an ancient and noble English family, of Norman or Danish extraction, tracing their descent from Manfred, who settled, before Rollo came to France, at Perci, near Villedieu. Its founder in England was William de Percy, called 'Alsgernons' or 'Algernon,' 'the mustachioed,' who came over with William I in 1066 (or 1067) and received lands in Yorkshire, where he resided, and in Lincolnshire, Essex and Hampshire. His son Alan succeeded him in 1116, as 2d Baron Percy. Alan's son William became 3d Baron Percy in 1168, and died without male issue, but Joscelin of Louvain, upon his marriage with William's sister, Agnes de Percy, took the family name and the title of 4th Baron. His son Richard (about 1170-1244) signed the Magna Charta. Their direct descendant in the 6th generation was Henry Percy (1342-1408), 1st Earl of Northumberland, who rebelled against Richard II, and then, with Henry IV, was defeated at Shrewsbury (1403), where his son Henry Percy, called 'Hotspur,' was killed, 21 July 1403, and at Bramham Moor, where he was slain (1408). Hotspur's son Henry (3 Feb. 1394-23 May 1455), 2d Earl of Northumberland, served often as special ambassador and at length became lord high constable, and fell on the Lancastrian side at Saint Albans. Six years later the 3d earl, again named Henry Percy (25 July 1421-29 March 1461), died in battle at Towton, where he was defeated by the Yorkists. The 4th Earl Henry (1446-28 April 1489) was killed in a popular uprising directed against him. His son Henry Algernon (13 Jan. 1478-19 May 1527), 5th Earl of Northumberland, served under Henry VII and Henry VIII, holding important offices and escaping from the jealousy of Wolsey. His son of the same name, the 6th earl (1502-29 June 1537), had no children, made the king his heir. The title went to his nephew Thomas, 7th Earl of Northumberland (1528-72), a Catholic, whose religion made him distasteful to Elizabeth. He joined Westmoreland in behalf of Mary Queen of Scots, rebelled openly in 1570, and was beheaded at York 22 Aug. 1572. He was succeeded in the title by his brother Henry (1532-21 June 1585), was devoted to Elizabeth, assisted in suppressing the Catholic rising led by his brother, but after his execution followed his example, declared for Mary, was seized, tried for treason, fined and released, only to be arrested a second and a third time, being sent to the Tower in 1584. There he was mysteriously shot through the heart, probably by his own hand. His son Henry (1564-5 Nov. 1632) was accused of complicity in the Gunpowder Plot and was imprisoned for nearly 16 years (1605-21) in the Tower, where he devoted himself to the sciences. His kinsman Thomas Percy, the actual organizer of the Gunpowder Plot, b. 1560; d. Holbeach, 10 Nov. 1605, was educated

a Protestant, but became an ardent Catholic, hired a house adjoining the Parliament house in his own name, put Guy Fawkes in charge and stored gunpowder in the adjoining cellar, intending to destroy the members at the next session. His plot was discovered and he escaped from London, but was pursued by government troops and in the ensuing fight was mortally wounded. The 10th Earl of Northumberland, Algernon Percy (October 1602–13 Oct. 1668), was the third great earl. He was appointed 23 March 1636, admiral of the fleet, in which position he attempted in vain to reform the navy under Charles I; sided with the opposition in the Long Parliament, but was in favor of peace throughout the civil war and took no part in public affairs during the Commonwealth; and advanced the cause of the Restoration. His son Josceline (4 July 1644–21 May 1670) was survived by a daughter, later the Duchess of Somerset, whose son became Duke of Northumberland. Consult De Fonblanque, E. B., 'Annals of the House of Percy' (London 1887).

PERCY, Florence, the pen name of Elizabeth Akers Allen (q.v.).

PERCY, George, English colonial governor: b. Northumberland, England, 4 Sept. 1580; d. England, March 1632. He entered the army, served in the Netherlands wars and in 1600 came to America where in 1609 he succeeded Capt. John Smith as governor of Virginia, retaining the office until Sir Thomas Gates arrived from England in 1610, when he became a member of the governor's council. From March 1611 to May 1612 he acted as deputy governor and in 1612 returned to England where he again served in the wars in the Low Countries in 1625, becoming captain in 1627. He was a man of much courage as a soldier and showed ability in administering the affairs of the colony when in his charge. He wrote 'Discourse of the Plantations of the Southerne Colonie in Virginia' (1606); and 'A Trewe Relation of the Proceedings and Occurrentes of momente . . . in Virginia . . . 1609–1612' (1625).

PERCY, Thomas, English prelate and antiquary: b. Bridgenorth, Shropshire, 13 April 1729; d. Dromore, Ireland, 30 Sept. 1811. He was graduated at Oxford in 1750, taking his M.A. in 1753, and after taking orders in the English Church was vicar of Easton Maudit, Northamptonshire, 1753–78. He proceeded to the degree of D.D. in 1770 from Emmanuel College, Cambridge. In 1778 he became dean of Carlisle, which he resigned in 1782 for the Irish bishopric of Dromore. The last five years of his life he was blind. He is best remembered by his 'Reliques of Ancient English Poetry'; and a poem, the 'Hermit of Warkworth.' Many of the pieces in the 'Reliques' were retouched, recast and, when fragmentary, completed, almost always with great taste. The work was published in 1765 and materially helped to give a more natural and vigorous tone to English literature. The manuscript source of Percy's 'Reliques' was edited and published by J. W. Hales and F. J. Furnivall in 1867–68. Percy was well skilled in the Icelandic and several other languages and he made some translations from Portuguese versions of Chinese works. He also published a curious domestic record, long extant in the Percy fam-

ily of Northumberland, with which he claimed a dubious kinship, and known as the 'Northumberland Household Book'—a document valuable for the light it throws on the manners of a bygone age. (See *RELIQUES OF ANCIENT ENGLISH POETRY*). Consult Gaussen, A. C. C., 'Percy: Prelate and Poet' (1908).

PERCY ANECDOTES, a collection of popular anecdotes published in monthly parts (1821–23). They were assumed to be from the pens of "Sholto and Reuben Percy, Brothers of the Benedictine Monastery of Mount Benger." The real names of the authors were Thomas Byerley (d. 1826), first editor of the 'Mirror of Literature,' and Joseph Clinton Robertson (d. 1852), editor of the *Mechanics' Magazine*. The Percy coffee-house in Rathbone place, London, was the customary place of meeting of Byerley and Timbs, and the series derived its name from this circumstance. A new edition of the 'Percy Anecdotes,' edited by Timbs in four volumes appeared at London in 1887.

PERDICCAS, pēr-dīk'as, Macedonian general: d. near Memphis, Egypt, 321 B.C. He was descended from the royal house of Orestis, a Macedonian province, attached himself to the court of Philip and was a member of that ruler's bodyguard at the time of his assassination. He fought in all the important campaigns of Alexander, and for his services at Susa received a crown of gold and the daughter of a satrap of Media for his wife. At Alexander's death Perdiccas received from him his signet ring, the symbol of royal power, and was placed in command of the military forces by the new sovereign Arrhidæus, the natural son of Philip, over whom he soon gained a paramount influence, practically controlling the government. War was at length declared against him by Antipater, Craterus and Ptolemy. Perdiccas thereupon marched into Egypt to meet Ptolemy and was slain by his own soldiers.

PERDIDO, pēr-dī'dō (Sp. pēr-fhē-thō), a river and bay which form the western boundary of Florida, separating it from Alabama. The river rises in southwestern Alabama and flows south into the bay. The bay is entirely landlocked and its outlet into the Gulf of Mexico is so small, and enters at so acute an angle with the line of coast, as to be almost undistinguishable from sea, from which circumstance the river and bay probably derived their Spanish word name *perdido*, or 'lost.' There are generally but four or five feet of water on the bar at its mouth. The river and bay were from an early period the boundary between the French colony of Louisiana and the Spanish colony of Florida, and were claimed as the eastern boundary of the territory acquired by the United States by the Louisiana purchase in 1803. The question was not settled till the cession of West Florida to the United States in 1819.

PÈRE GORIOT, pār gō'rē-ō. 'Père Goriot' (1834), probably best of the 'Parisian Scenes' in the 'Comédie humaine' by Honoré de Balzac, is the counterfoil of 'Eugénie Grandet.' There avarice crushed paternal affection; here the too-loving father—a bourgeois Lear—is made the victim of his daughters' folly and insatiable social ambition. The story,

like many even of the best of Balzac's, lacks unity. Interest is divided between the tragedy of Goriot's unrequited paternal devotion, the social climbing of Rastignac, and the personality of the super-criminal Vautrin, both of whom play leading parts in other scenes of the *Comédie Humaine*. So far as it concerns Goriot the story is in outline this: He had amassed a considerable fortune as a speculator in food and as a politician in Revolutionary days, had divided it between his daughters, spoiled children, who had married beyond their station, Anastasie the Count de Restaud, Delphine the Alsatian Nucingen, a wealthy banker, of whom they neither had the love nor deserved the respect. Their follies for worthless lovers brought both into repeated financial crises from which they were partly extricated by the father's unreckoning sacrifice. Seeking to secure their happiness by the gratification of their desires, he completes his own ruin without averting theirs. Already fatally compromised, they shine at a ball while their father is dying, and are constrained to leave him to the barest of funerals at the charge of a medical student and Rastignac. A fierce quarrel of the daughters over the fainting Goriot, and his death, following hard upon it, are described with great power. Notable, too, are the pages in which the ex-convict and satanic philosopher of cynical self-will Jacques Collin, alias Vautrin, beguiles Rastignac to crime. The progressive corruption of this brilliant youth, under Vautrin's promptings and the exigencies of his relations with Delphine, is admirably exhibited. Much of the action takes place in a Parisian boarding-house, precisely located in the Rue Neuve-Sainte Geneviève, "between the Latin Quarter and the Faubourg-Saint-Marcel," the famous Pension Vauquer, described with really marvelous minuteness of vision in the opening pages. Here lived and died Père Goriot, in a room as minutely depicted. Every boarder is made a portrait-study, notably the young and beautiful Victorine Taillefer. The landlady, the porter, the maid are no less individualized. In and above the social circle of Anastasie and Delphine, the Vicomtesse de Beauséant and the Duchess de Langeais are engaging figures. Indeed few novels count so many life-like character studies, though all of them pale before the picture of the tortured heart of Goriot, drawn as it were in blood, and of Rastignac, with high breeding and slender purse, cast to sink or swim in an unfamiliar world. Vautrin, though less real, lives, like his fellow-superman and convict, Hugo's Jean Valjean, by the sheer creative power of genius. How society dominates at last even the giants who contravene its laws remained to be shown in 'Lost Illusions,' 'The Splendors and Miseries of Courtesans' and 'The Last Incarnation of Vautrin.' The later fortunes of Anastasie may be followed in 'Gobseck' and 'The Beauvisage Family'; of Delphine in many stories notably 'The Deputy from Arcis.' Rastignac has a subordinate part in many novels, among them 'Lost Illusions,' 'The House of Nucingen' and 'Cousine Bette.' It is enough for 'Père Goriot' to have given senile paternal devotion and self-centred filial ingratitude probably their strongest expression in all fiction. There is a good translation in 'Everyman's Library.'

BENJAMIN W. WELLS.

PÈRE LACHAISE, pār-la'shāz', a cemetery on the northeast side of Paris and one of the most remarkable burial grounds in the world. Its site was the garden of the country villa bestowed on François d'Aix de Lachaise, confessor of Louis XIV, by that monarch. It was converted to its present use in 1804 and now contains over 20,000 monuments and nearly 800,000 graves. Some of the great figures in French modern history repose within its precincts. Here, too, is the celebrated monument to Oscar Wilde.

PEREDA, pā-rā'thā, José Maria de, Spanish novelist; b. Polanco (Santander), 6 Feb. 1833; d. there, 1 March 1906. He received a good education, was graduated as an engineer, but soon found that his talents and inclinations lay in the direction of literature. As he possessed independent means, he determined to satisfy his preference in this respect. His early work brought him little recognition because it confined itself to the description of local scenes and characters until then practically unknown beyond their local domain. Yet his 'Escenas Montañesas' (1864) and other like works are clever in presentation, excellent in diction and original in form and presentation. Among his other publications worthy of special notice are 'Bocetos al Temple' (1876); 'Tipos' (1877); 'El buey suelto' (1877); 'Don Gonzalo Gonzalez de la Gonzalera' (1878); 'Pedro Sanchez' (1883); 'Sotileza' (1884); 'La Montalvez' (1888); 'La Puchera' (1889); 'Nubes de Estío' (1891); 'Al primer vuelto' (1891); 'Penas arriba' (1895); 'Pachin Gonzalez' (1895). Pereda, though not a very cosmopolitan writer, shows a great deal of originality in the handling of his subjects, plots and characters. His personages are for the most part local, but instinct with life and truth. An exception must be made in the case of his villains which are invariably over-drawn, often to such an extent that they appear caricatures. His language is strong and good and has great skill in the depicting of nature. See PEDRO SANCHEZ.

PEREGRINUS, Petrus, otherwise Pierre de Maricourt, writer of the earliest treatise on the magnet, A.D. 1269. He owes his surname to the village of Maricourt in Picardy and the appellation Peregrinus, or Pilgrim, to his having visited the Holy Land. Little is known of his life save that he was a man of academic culture and a leader in experimental philosophy, that he was greatly admired by his contemporary, Friar Bacon, and that he served in the engineering corps of the French army which laid siege to Lucera in southern Italy in 1269. It was in the midst of his warlike duties at Lucera that Peregrinus sought to construct a motor which would keep the orrery of Archimedes in continuous rotation for a definite time; and in the course of this work, he was led to the consideration of perpetual motion itself with the result that he showed diagrammatically and to his own satisfaction how a wheel might be kept in movement forever by magnetic attraction.

To explain this magnetic motor, the first of its kind the world had ever heard of, Peregrinus wrote a letter of 3,500 words — the 'Epistola ad Sigerum' — from the trenches at Lucera to one Sigerus, a friend of his at home, in which he expounds clearly and methodically the prop-

erties of the magnet, many of which he himself had discovered. The letter is one of great interest in physics, geodesy and navigation. In it Peregrinus assigns a definite position to the poles (he uses the term) of a lodestone, and shows how to determine which is north and which south; proves that unlike poles attract and similar ones repel each other; breaks a magnet into pieces and finds that each fragment, however small, is a complete magnet; recognizes that a pole of a magnet may neutralize a weaker one of the same kind and even reverse its polarity; and crowns his work by supporting his magnets on a pivoted axis instead of floating them on corks or in glass vessels, as previously done, and by surrounding them with graduated circles; all this 50 years before Flavio Gioia of Amalfi invented his form of the mariner's compass which brought him fame.

Of manuscript copies of the 'Epistola,' the Bodleian library has six; the Vatican two; Trinity College, Dublin, one; the Bibliothèque Nationale, Paris, one; Leyden, Geneva and Turin, one each.

The first printed edition came from the presses of Augsburg in 1558, having been prepared by Achilles Gasser, a physician of Lindau who was well versed in mathematics, astronomy, history and philosophy. Libri published another in his 'Histoire des Sciences Mathématiques en Italie,' (1838), as did Bertelli in the 'Bulletino di Bibliografia e di Storia delle Scienze Matematiche et Fisiche' (1868) and Hellmann in his 'Rara Magnetica' (1898).

Bertelli not only gives the Latin text, but collates and compares the readings of the Vatican codices with other manuscripts, adding copious references, critical remarks, etc.

Of translations, we have one by Prof. Silvanus P. Thompson (London 1902), and another by Brother Arnold of Manhattan College (New York 1904).

PEREIRA DA SILVA, dā sêl'vā, Joao Manuel, Brazilian historian: b. Rio de Janeiro, Brazil, 30 Aug. 1817; d. 1898. He was educated in Brazil and in Paris, admitted to the bar of Rio Janeiro in 1814 and practised law successfully. In 1844 he was elected to Congress, where his course was conservative. As a historian he gained a wide reputation; among his works are 'Historia da fundação do imperio Brasileiro' (1864-68); 'Plutarcho Brasileiro' (1866); 'Obras politicas e literarias' (1868), etc.

PEREIRE, pā-rār, Jacques Emile (b. Bordeaux, 3 Dec. 1800; d. Paris, 6 Jan. 1875); Isaac (b. Bordeaux, 25 Nov. 1806; d. 12 July 1880), French bankers. They gained an immense fortune through the organization of the Paris and Saint Germain Railroad and afterward engaged in vast speculations. They founded the Société du Crédit Mobilier in 1852 (see CREDIT MOBILIER), and upon its becoming bankrupt contributed \$16,000,000 to aid its reorganization. They greatly built up trade between France and America and through their efforts lines were established to South America, Mexico and the West Indies. They were the founders of a maritime company in 1855 which subsequently became the Campagnie Générale Transatlantique.

PEREIRA, Jonathan, English pharmacologist: b. Shoreditch, London, 22 May 1804; d.

20 Jan. 1853. He studied medicine and in 1823 was appointed resident medical officer of the general dispensary in Aldersgate street; after ward becoming lecturer on chemistry. In 1824 he published a translation of the 'London Pharmacopœia,' followed by 'A Manual for the Use of Students'; 'A General Table of Atomic Numbers, with an Introduction to the Atomic Theory,' and other textbooks. In 1832 he resigned the office of lecturer for that of professor of materia medica in the New Medical School in Aldersgate street, and succeeded Dr. Gordon as lecturer on chemistry at the London Hospital. His great work, 'Elements of Materia Medica,' appeared as a separate work in 1839-40, and at once established his reputation. The treatise is remarkable for research, variety of scientific, commercial and practical information, and scrupulous exactness. In 1841 he procured the license to practice in London from the College of Physicians and in 1845 was elected a fellow of that body, and on the establishment of London University he was appointed examiner in materia medica and pharmacy. Among his contributions to science, his excellent treatises on 'Diet' and on 'Polarized Light' (1843) are best known. His death was the result of a fall.

PÉREZ, Antonio, Spanish writer: b. Monreal de Ariza (Aragón), 1539; d. Paris, 3 Nov. 1611. He was at once a statesman of note in his day and he held a high place among the best letter writers of his age. A natural son of Gonzalo Pérez, Minister to Charles V and Philip II, he early obtained through his family connection and his own intelligence and talent strong influence at court, where he became secretary to the latter sovereign. He was peculiarly fitted for this position, having received the best education possible in his day at Madrid, Venice and Louvain. As the trusted agent of the king in almost every important political move, Pérez played a very prominent part in the politics of Europe, in their relation to those of Spain, for several years. In this connection he was mixed up in several unsavory acts, among them the murder of Juan de Escobedo, the special ambassador at the Spanish court of Don Juan of Austria (1578). In all of these moves he undoubtedly acted with the consent, if not at the solicitation, of the king. These acts raised up for him many enemies, among the bitterest and most persistent of whom were the relatives of Escobedo. At first the king loyally backed his secretary and agent; but Pérez made the mistake of playing false to his master; and the latter became his unrelenting enemy. Pérez fled from the Spanish Court to Aragon and, on the fall of the latter, he went to Paris and, later on, from there to London, then back again to Paris. Pérez had the ability to present his thoughts in a novel and interesting form. His "revelations" are to-day among the most unblushing confessions of an unblushing age. They are, therefore, of great interest in that they present a picture of the intrigues, corruptions, vices and love affairs of the court of Philip II and depict the sovereign himself and those surrounding him. His two most interesting remains are his 'Relaciones' and his 'Memorial del hecho de su causa.' The former which recounts at length his experiences was published in London in 1594. Consult Froude, J. A., 'Spanish Story of the Armada'

(New York 1892); Hume, M. A. S., 'Antonio Pérez in Exile' ('Transactions,' Royal Historical Society, London 1894); 'Españoles é Inglesés' (Madrid 1903); Miguel, A. M., 'Antonio Pérez et Philippe III' (Paris 1845); Muro, 'Vida de la Princesa de Eboli' (Madrid 1877); consult also Fitzmaurice-Kelley, 'Spanish Literature' (New York 1908); Ford, J. D. M. A., 'A Spanish Anthology' (New York 1901); Ticknor, M., 'History of Spanish Literature' (New York 1854).

PEREZ, pā'rêts, Isaac Loebush, Jewish writer: b. Zamosc, Poland, 1851; d. 1915. He received the traditional Jewish training, after which he prosecuted secular studies. For many years he was a practising lawyer, but the restrictions imposed on members of his race obliged him to forego a legal career. He became secretary to the Jewish community at Warsaw and there he remained until his death. His first literary efforts were in Hebrew, but he soon abandoned this tongue in order to reach a larger audience through the Yiddish. His works are 'Stories in Verse and Miscellaneous Poems' (1877); 'Love Poems' (1894); 'Collected Writings' (1899-1901), in Hebrew. In Yiddish there appeared 'Schriften' (1906); 'Folk Tales' (1909); 'Dramas' (1910); 'Adam and Eve' (1910); 'Chasidisch' (1911); 'Sketches and Pictures' (1911); 'For Young and Old' (1911); 'The Old and the New' (1912). For an appreciation of Perez's influence on his audience consult Pinès, 'Histoire de la littérature judéo-allemande' (Paris 1910).

PÉREZ, pā'rāth, Pedros Ildefonso, Mexican minor poet: b. Merida, Yucatan, 23 Jan. 1826; d. there, 21 Feb. 1869. He was self-educated, entered the employ of the government when very young, meanwhile continuing his study of literature, particularly the works of the Spanish poet Zorrilla. In 1849 he was one of the founders of the Academy of Science, and at his death was a member of the government council and comptroller of the treasury of his native state. His work was long in gaining recognition and the best of it was published in the literary journals *Mosáico* and *Pensamiento*. A collection of his poems was published in 1885. Among his works are 'La Ida del Sol'; 'A Tunkas'; 'El Prisma de la Vida,' etc.

PÉREZ GALDÓS, Benito, Spanish novelist and dramatist: b. Las Palmas, Canary Islands, 10 May 1845; d. 3 Jan. 1920. He was graduated in law at Madrid but finally gave it up to devote his energies to painting, for which he displayed considerable talent. But the revolution found him contributing political, critical and literary articles to *El Parlamento*, *La Nación*, *El Contemporáneo*, *La Revista de España* and other Madrid papers. In 1871 he published his first historical romance, 'El Audaz,' which was so favorably received by the public that he was enabled to find a publisher for 'La Fontana de Oro,' which had been written four years earlier. He found a mine of wealth in the stories, tales and incidents connected with the political and national struggles of Spain from the beginning of the 19th century on to his own time, and in 1873 he began the publication of 'Episodios Nacionales,' which resulted in 10 volumes covering the war for independence and the events that led up to

it. These romances include 'Trafalgar,' 'La corte de Carlos IV,' 'El 19 de Marzo y el 2 de Mayo,' 'Bailén,' 'Napoleón en Chamartín,' 'La Batalla de los Arapiles,' 'Zaragoza,' 'Gerona,' 'Cádiz,' 'Juan Martín el Empecinado' (1873-75). They became very popular and placed Pérez Galdós among the foremost Spanish literary men of his day. A second series of national romances followed in 10 volumes and became as popular as their predecessors. This latter series shows more maturity, better literary form and more certainty in the presenting of the artistic coupled with a broad sympathy for and a deep insight into human nature. It includes 'El equipaje del Rey José,' 'Memorias de un cortesano de 1815,' 'La segunda casaca,' 'El Grande Oriente,' 'Siete de Julio,' 'Los cien mil hijos de San Luis,' 'El terror de 1824,' 'Un voluntario realista,' 'Los apóstólicos,' 'Un faccioso más y algunos frailes menos.' Slowly but surely Pérez Galdós was developing a mastery over his characters, his literary material and himself that was to place him in the very fore rank among the Spanish romantic writers of the 19th century. His studies of the history of the political and social struggles of Spain during the first half of the past century had shown him the bigotry and religious intolerance then characteristic of Spanish life, especially in the rural districts; and his own naturally liberal attitude toward political and religious questions had displayed itself frequently in the two series of 'Episodios nacionales.' So when he began, in 1876, the publication of the 'Novelas españolas contemporáneas,' he had insensibly drifted into a field where his genius found itself more at home than it had ever previously been. With a skill and enthusiasm surpassing the best displayed in his previous work, he set himself to depict national customs, habits, prejudices and modes of thought. He was the valiant knight of the crusading days going out after the bigotry of his own age. His pictures of Spanish society are instinct with life, virility and the compelling sense of their truthfulness. An earnestness and a power of describing feelings and passions pervade this whole series of 'Novelas españolas contemporáneas'; so these new novels got closer to the heart of the Spanish people than any of his previous ones had done; and having a much broader and more general human interest, they soon made the author popular outside his own country. This popularity called for translations of practically all of the series of 'Novelas contemporáneas' into the various languages of Europe. Pérez Galdós thus soon found himself at the head of a school of his own, composed of uncompromising adherents and admirers among the younger literary set of Spain, behind whom stood the greater part of the novel reading class of the nation, who were captivated with his power of depicting most convincingly so many striking and interesting phases of the national life, and of drawing female characters with a skill surpassed by few, if any, Spanish writers. All Spain loves a good love story and Pérez Galdós presented it with love stories, the heroines of which seemed almost at once, after their appearance, a part of the national life. The peculiarly national yet realistic types thus presented in the midst of the bitterest satire on

the narrowness of rural life, its self-complacency and its intolerable bigotry, tended to fix the national attention on his female characters which are generally the storm centre of a stormy plot and of intrigues which have made them the subjects of much and bitter discussion and the recipients of strange sympathy from the followers and friends of Pérez Galdós, who were legion in Republican and revolutionary Spain. His attacks on the bigotry of the Church and his ridicule of the priests brought the Catholic organizations about his ears; and this made the author himself a storm centre, the result of which was that the echo of the local conflict resounded in foreign countries; and the comparatively young author woke to find his works being studied by foreign literary societies and clubs and placed as school texts on the curriculums of colleges and universities wherever the language of Cervantes was studied. 'Gloria' and 'Doña Perfecta' became almost as well known abroad as in Spain. To the novels of this class, which may be called the third period of his literary activity, belong 'Marianela,' 'Doña Perfecta,' 'La familia de Leon Roch' (1878); 'Gloria' (1879); 'El amigo Manso' (1882); 'El doctor Centeno' (1883); 'La de Bringas' (1884); 'Tormento'; 'La prohibido'; 'Fortunata y Jacinta'; 'Miau'; 'La Incógnita'; 'Torquemada en la hoguera'; 'Realidad'; 'La desheredada'; 'Angel Guerra'; 'La Sombra'; 'Tristana.' In various other novels not here mentioned he continued to work the veins of national customs, characters and incidents to the satisfaction of the Spanish reading public by whom he was more or less idolized.

While Spain has, since the beginning of the present century, been fairly unanimous in according Pérez Galdós the first place among Spanish novelists of the latter quarter of the 19th century, there still exists a very decided difference of opinion as to his merits as a dramatist. His dramas show much less marks of originality than his novels. Most of them in fact being dramatizations of his novels interspersed with an occasional original drama. Pérez Galdós began his dramatic career in 1892 with a dramatization of his successful novel 'Realidad.' This was followed by 'La Loca de la Casa' in 1893, and 'Gerona.' These all had a certain success which the fame of the author lent them, but nothing more. 'La de San Quintín' presented in 1894, was enthusiastically received because its dramatic construction is much better than the dramas that preceded it and because it is socialistic in the extreme in its denunciation of inherited wealth and position and oppression of the poor and the laboring classes. Among the other dramas of Pérez Galdós, several of which have been very successful, are 'Los Condenados'; 'Voluntad'; 'La fiere'; 'Electra'; 'Mariucha'; 'Bárbara'; 'Amor y ciencia'; 'Pedro Minio'; 'Casandra'; 'El abuelo'; and 'Doña Perfecta.' The Spanish critics have complained that Pérez Galdós' Spanish is by no means classical, and that even in his own finest descriptive passages, dialectic forms and grammatical improprieties are constantly creeping in. Yet in spite of these acknowledged shortcomings, he was head and shoulders above any other Spanish novelist of his own time. He had the wonderful power of observation of Scott, Dickens and Manzoni;

and his voice was nearly always pitched in a true key. He made breathe again for us the people of an age but recently past, an age like our own in that it was one of wonderful new ideas about which the passions of mankind fought and for which many bled and died; yet very different from our own in its attitude toward most of the questions that vitally affect human life. This great difference Pérez Galdós paints always with the truth and sympathy of a master hand. In his later novels and dramas he presents contemporary society, taking up in each some great national problem. New and modern ideas and the wall of prejudice and bigotry opposed to them form the great underground structure of most of his modern novels and dramas. He seems to be ever actuated by some impelling purpose, which never lets the interest of the story lag. His plots are well developed; he has a real genius for the creation of types, characters and costumes. In the first two series of the 'Episodios' there are over 500 well-defined characters; and in the other two series published at a much later date, the power of creation is still with him. This power he owed in part at least to years spent in investigation in archives, libraries and among papers, documents, letters, biographies likely in any way to illustrate the history of Spain in the first half of the 19th century and, more especially, that of the French invasion. In pursuit of his work he studied the clothing, customs, advertisements, proclamations and laws of the period he wished to introduce into his story. His fascinating style, his brilliant descriptive power and his ability to group his scenes and characters with artistic effect around great national questions enabled Pérez Galdós to make for himself a permanent place in Spanish literature. JOHN HUBERT CORNYN.

PÉREZ DE HITA, Ginés, Spanish poet: b. Murcia, and flourished in the second half of the 16th century. He took part in the war against the uprising of the Moor, which began in 1560. This much is known of his life from his 'Guerros Civiles de Granada,' which enjoyed a great reputation during the life of the author and for many years afterward, and which is still a valuable authority on the events of which it treats and the relations between Moors and Christians in Southern Spain down to the end of the 16th century. This work consists of two parts, one of which was published in Zaragoza in 1595, and the other in Barcelona in 1619. Both parts have been printed many times and generally issued in one volume. One of the best editions is that published in the 'Biblioteca de Autores Españoles' (Rivadeneira). This edition contains a valuable preface by Buenaventura Carlos Aribau (Vol. III). As poet Pérez de Hita does not stand very high; but as a simple, direct and effective historian his work is of great value. It has the added merit of seeing the troubles

of Spain from the point of view of both contending factions; and he not infrequently lashes with unsparing hand the savagery and injustice of the Spaniards upon whom he blames much of the trouble. The two volumes of 'Guerras' are in reality distinct works since they treat of totally different events and personages in no way directly connected with one another. They are, moreover, distinct in subject and manner of treatment. The first volume is little else than a historical novel; while the second is history told very much in the form of a novel. Both are interesting and their stories are well presented from the point of view of the author; who is ever as ready to use his imagination as his labors and investigations in the realms of true history. The author writes like a soldier, and especially in the second volume the events that come under his attention either directly or indirectly through stories heard in camp, interest him more than direct and formal history adjusted to dates and official documents and developed in detail. These defects, in reality, at this distant date, make the 'Guerras' the more interesting and, in a sense, valuable, since they breathe the spirit and paint the customs of the age in which they were written. As the author unfolds his story we see the life of the camp and feel, in his tale, the breath that animated society when man's chief business was war and his greatest glory was gained from feats of arms. The 'Guerras' is filled with singular combats told in a spirited way that proclaims that the heart of the author was in his task; and the language of the text is singularly modern.

PÉREZ DE ZAMBRANA, dā sām-brā'nā, Luisa, Cuban poet and novelist: b. El Cobre, Cuba, 1837. She came of a very poor family, and spent her early days in the country, where she received a very meagre education. She read widely the Spanish poets, and early began to write poems which displayed depth of feeling and a fine sense of the rhythm of language. At the age of 14 she published, in the local press, 'Armor Materno' (Maternal Love), which attracted attention. This she followed with frequent contributions to the press, principally to *El Orden* of Santiago de Cuba, the following year. One of her poems, 'A Cuba,' became so popular that it was learned by the school children, and recited in public, in salon, school and theatre. At the age of 19 she published a volume of poems 'Poesias' which at once gained for her a national reputation. In 1858 Miss Pérez married Dr. Zambrana of Havana, a writer also of considerable reputation. Three years later Zambrana began the publication of *El Kaleidoscopio*; and for this his wife did some of her best work. Her poems were welcomed by the press of the capital and she contributed to the *Aguinaldo Habanero*, *La Havana*, the *Album de lo Bueno y lo Bello*, *Cuba Literaria*, *Revista Habanera*, *Brisas de Cuba*, *Ofrenda al Bezar*, *La Guirnalda* and *Noches Literarias*. In 1860 another volume of 'Poems' appeared with a critical yet laudatory preface, by Avellaneda, then at the height of popularity. This so increased her reputation that her poems were copied extensively in Spain and many of them were translated into Italian and French by eminent poets, all of whom found in the work of the young Cuban poet

a new and compelling note of frankness, simplicity and wealth of poetic feeling. Among her admirers was the Italian poet Mantici who translated her 'Al campo,' 'Noches de luna,' 'El sabio en su patria,' and other poems into Italian; and Alexandre Aveline, who translated 'La caridad' into French. Among her novels and numerous other prose writings are 'Mujeres célebres,' 'Dolor,' 'A las estrellas,' 'Angélica,' 'Estrella' and 'Hija del verdugo.' To these must be added another book of poems issued in 1880, which still further increased her reputation at home and abroad. A vast amount of her writings is still buried in the files of the *Liceo Habanero*, *El Ateneo*; *El Siglo*; *Revista de Cuba*, *Album de las Damas*, and other periodicals to which she contributed in later years.

PERFUMES (pér-fūmz or pēr-fūmz') and **PERFUMERY.** Perfumes are substances of pleasing odor, prepared for use by combining them with inodorous materials, as grease, spirits, starch, soaps, snuffs. They are used in the extract form and in cosmetics, dentifrices, pastes, tinctures, incense, pastils, pomades, hair-oils, hair-washes and dyes, depilatories and other toilet accessories. They are classified as natural or artificial: the former being derived from animal and vegetable substances found in nature; the latter being produced synthetically by combining chemical substances.

Animal Perfumes.—There are four odors of animal origin used in perfumery—namely, musk, ambergris, civet and castor. The aroma of musk freely imparts odor to every body with which it is in contact. Its power is such that polished steel will become fragrant if it the metal be shut in a box where there is musk, contact not being necessary. In perfumery manufacture tincture of musk is mixed with other odorous bodies to give permanence to the more evanescent perfumes or bouquets, the musk acting to them almost as a mordant does to a dyestuff. The usual statement as to the length of time that musk continues to give out odor is exaggerated. If fine musk be spread in thin layers upon any surface and fully exposed to a changing current of air, all fragrance, it is said, will be gone in from 6 to 12 months. The finest musk, that which indeed is the only kind really useful in perfumery, is distinguished as Tonquin musk, the average price of which is about \$25 per ounce. Civet is exceedingly potent as an odor, and when pure, and smelled at in the bulk of an ounce or so, is utterly insupportable from its nauseousness; in this respect it exceeds musk. When, however, civet is highly diluted so as to afford but minute quantities to the olfactories, its sweet perfume is generally admitted; the fragrant principle is the same as that emitted by the beautiful narcissus, which also is too powerful for a great many persons. Civet is extensively used, when duly attenuated, in perfumery. Its powerful and lasting odor makes it very useful in soaps, and especially in sachets.

It is one of the perfumes of "Spanish leather," or *Peau d'Espagne*; the first gloves used in England were scented with it. Several thousand ounces are annually imported, the average price of which is about \$3 per ounce. Castor, although it cannot be largely used in any given perfume on account of the very dark color of its tincture, when properly diluted is extensively employed. Its perfume, when old especially, is exceedingly pleasant, and its fixing power is at least equal to that of musk. Its market price is about \$12 a pound.

Vegetable Perfumes.—The simplest perfumes and doubtless the most primitive are those exhaled by flowers dried for domestic use—rose petals, violets, lavender flowers, etc.—and combinations of these with fragrant spices and odorous woods and herbs. The fragrant gum-resins, in use from the most ancient times, exude naturally from the trees which yield them, or from wounds accidental or purposely inflicted to increase the yield. These may be regarded as perfumes in a solid form. The most important are benzoin, myrrh, opoponax, tolu, Peru and storax. A second group which are procured by distillation and are mostly fluid bodies are termed volatile oils, essential oils or ottos—formerly quintessences. Odor-bearing plants contain the fragrant principle in minute glands or sacs; these are found sometimes in the rind of the fruit, as the lemon and orange; in others it is in the leaves, as sage, mint and thyme; in wood, as rosewood and sandalwood; in the bark, as cassia and cinnamon; in seeds, as caraway and nutmeg; in yet others in the petals, as in rose, lavender or ylang-ylang. The odor principle of orris is a solid resembling cocoa-butter, and is contained in what is really the rhizome of *Iris florentina*, though technically called orris-root. These glands or sacs of perfume may be plainly seen in a thin-cut stratum of orange-peel; so also in a bay leaf, if it be held up to the sunlight, all the oil-cells may be seen individually. All the fragrance-bearing substances yield by distillation an essential oil peculiar to each; thus is procured oil of patchouli from the leaves of the patchouli plant (*Pogostemon patchouli*), a native of Burma; oil of caraway, from the caraway-seed; oil of geranium, from the leaves of the *Pelargonium roseum*; oil of lemon, from lemon-peel, *Citrus limonis*; and a hundred others of infinite variety.

The celebrated perfumer Eugene Rimmel groups the scents mostly used in perfumery under 18 kinds, represented by the following types: rose, jasmine, orange-flower, tube-rose, violet, balsam, spice, clove, camphor, sandal, citrine, lavender, mint, aniseed, almond, musk, ambergris and vanilla. The first five mentioned, with acacia, are those most largely used in compounding the popular perfumes of the present day.

Manufacture of Natural Perfumes.—By the improvements introduced during the first half of the 19th century by Darcet, Leblanc, Robiquet and Chevreul, the perfume industry has developed rapidly and extensively. The reduction of the chemistry of essential oils to an exact science and the simplification of the machinery employed have done much for the industry, particularly in France. The prepara-

tion of all natural perfumes requires the exercise of the most delicate care. If, for example, the essence is contained in the flower, the perfume finally obtained will vary considerably with the age of the flower, with the atmospheric conditions at the time it was plucked and with the process of extraction employed. It may happen, therefore, that instead of the exquisite aroma which is exhaled by the growing plant, an odor is obtained totally lacking in delicacy. No little skill, experience and knowledge are required in the art of making perfumes. Nevertheless, certain general methods are employed which may here be briefly outlined. The process of infusion is employed for iris, musk, civet, benzoin and the like. The odorous substances are macerated with alcohol, thus forming tinctures. The process of expression is employed to a certain extent in the making of citron, orange and bergamot perfumes. The best essential oil is obtained simply by squeezing the peel with the hand. In Calabria, Italy, the expressed residue is afterward distilled with steam; but the essential oil thus extracted is of an inferior quality. The process most widely employed is that of distillation, which is resorted to for the extraction of essences that neither a high temperature nor aqueous vapor can appreciably decompose. Rosemary, thyme, ylang-ylang, roses, patchouli, lavender, cedarwood and sandalwood are thus treated. Long experience has shown that there are certain theoretical conditions which should obtain in practice. Among these conditions may be mentioned the picking apart of the flower to facilitate the diffusion of the essential oil; the treatment of proper quantities to obtain stronger products; distillation gradually increased in intensity by increasing the heat at the end of the process; the evacuation of the vapors with the utmost expedition; and quick condensation. The apparatus used for the purpose of attaining these objects varies in form almost infinitely. The use of fixed solvents depends upon the property which fatty substances have of absorbing perfumes when in contact with fragrant bodies. The cold process, absorption or *enfleurage*, as it is called by the French, is chiefly made use of for procuring the odoriferous principle of very delicate flowers, such as the jasmine and tuberose. Lard is the fat usually employed, although a mixture of beef fat with the lard is preferred for some perfumes. In the most approved apparatus the fat is laid out in "strings" on glass plates, with a fine syringe, and these plates are stacked in a tall case so that an air space is left alternately at front and back so that a current of air passing through the stack has to flow across every plate. The flowers are placed in bulk in a tall container and an air current forced through them passing thence through the stack with its larded plates. By careful adjustment of the size of the container and the stack, almost every bit of fragrance imparted to the air current is caught and held in the lard. The delicate perfumery oils are dissolved out of the fat with alcohol, chloroform, benzine, bisulphide of carbon, ether or petroleum spirit, according to the volatility of the oil obtained. The solvent is then evaporated by manipulation of the temperature with cold or heat. If the hot process is employed the flowers are encased in small

bags of fine linen and hung in jars of fat which is kept melted by being immersed in warm baths or by hot-water jackets, into which the pots are fitted. The temperature is kept at from 100° to 120° F., for from 12 to 48 hours, according to the particular flowers being treated. In the larger establishments this operation is conducted in a continuous apparatus, formed of a series of fat-pots each containing a network basket filled with the flowers. A continuous current of melted lard flows through the apparatus in at the bottom of the pot and out of the top and thence into the bottom of the next in the series, and so on. New baskets of flowers are continually being fed into the apparatus, the newly-filled basket going into the last pot—that holding the lard which has the largest absorption of perfume. As each new basket is placed, all the others are moved up one place in a direction contrary to the flow of the lard. The flowers after passing through the series of pots are put into a hydraulic press and subjected to great pressure. This apparatus has been proved thoroughly effective. The fragrant oils are dissolved out of the lard by appropriate solvents, as already described, and the lard is ready to be used over again. Instead of fat, either glycerine or, as is usually the case, vaseline can be employed. In the manufacture of extracts the flowers are treated with alcohol until the essence is entirely removed. Rose water and similar perfumes are made by simply heating the fresh flowers in water: for rose water the proportion is five pints of water to each pound of rose petals. The heat is applied by steam pipes surrounding the bath and after the perfume is absorbed by the water, the whole is gently distilled, only the first half (two and one-half pints) being saved. Sufficient alcohol is added to keep it from molding. Oils of the citrus fruits—orange, lemon, bergamot, etc.—are secured by hand. The rinds of these fruits are cut into strips and removed from the fruit, being placed in water to soak for a short period. They are then squeezed against small sponges which take up the oil. These are afterward pressed out or dissolved out, according to the process used. As the quality of these oils is adversely affected by heat, they are distilled at a low temperature in a vacuum. Although most of the fragrant flowers which form the basis of natural perfumes are grown in the vicinity of Grasse, Cannes and Nice, nevertheless almost every quarter of the globe pays its floral tribute to the perfume makers of France. The distilleries of essential oils in the department of Alpes-Maritimes use annually 5,500,000 pounds of orange blossoms; 4,400,000 pounds of roses; 440,000 pounds of jasmine; 330,000 pounds of violets, and an equal quantity of cassia and tuberoses. In Basse-Alpes, Gard, Drôme, Hérault and Var 220,000 pounds of lavender essence; 88,000 pounds of thyme essence; 55,000 pounds of rosemary essence and the same quantity of aspic essence are annually manufactured. Furthermore, the environs of Algiers, Staouéli, the plain of Mitidja and Boufarik (Algeria), annually send to France a contingent of 13,300,000 pounds of rose geraniums and rosemary, Malaga supplies lavender, rosemary and thyme; Corsica, geranium; Dalmatia, lavender oil; Cyprus, the oils of myrtle and origanum; Mexico, the oil

of linaloe; China, the oils of cassia and anise; Calabria, the oil of bergamot; Zanzibar, oil of cloves and other spice oils; Rumania, oil of fennel; Holland, oil of caraway; Tuscany, oil of orris; France, Spain and North Africa, oil of thyme; Burma, oil of lemon-grass; Asia Minor, oil of origanum and, since the war began, otto of roses, formerly supplied chiefly from Bulgaria, Uganda, oil of backhousia; Saint Thomas, West Indies, oil of bay; Paraguay, petitgrain oil; French Guiana, bois de rose femelle oil; Malay Archipelago, Java and the Philippines, ylang-ylang, patchouli and citronella; Mysore and Madras, oil of sandalwood. Natural perfumery oils are classified according to their chemical constitution, as follows:

Geraniol Group.—Otto of roses, the geranium oils of Turkey, France, Algeria, Spain and Italy (presenting minor differences); palmarosa oil, and the citronella oil of Ceylon.

Linalol Group.—Bois de rose femelle, linaloe, neroli, petitgrain, French lavender, English lavender, spike lavender, bergamot.

Eugenol Group.—Clove, cinnamon leaf, pimento, bay.

Anethol Group.—Star anise, fennel.

Saffrol Group.—Sassafras, camphor.

Thymol Group.—Origanum, thyme.

Aldehyde Group.—Java citronella, cinnamon (bark), cassia, lemon, orange, lime, citron, lemon-grass, backhousia, bitter almonds.

Ketone Group.—Caraway, dill, spearmint, pennyroyal.

Menthyl Group.—Peppermint of Japan, peppermint of America, black peppermint of England, Italian peppermint.

Borneol Group.—Rosemary, pinus pumilio, pinus Sibirica.

Cineol Group.—Eucalyptus globulus, eucalyptus dumosa, cajaput.

Sesquiterpene Group.—Cubebs, juniper, patchouli, vetiver.

Unclassified.—Orris, wintergreen, sandalwood, ylang-ylang.

Manufacture of Artificial Perfumes.—The first synthetic perfumes were discovered by Cahours, Grimaux and Lauth in 1851; but the industry of artificial aromatic products hardly developed until the discovery of coumarin in 1868. The industry took its sudden rise after the remarkable synthesis of vanillin by Tiemann and Haarmann in 1885, followed by heliotropin in the same year. By artificial perfumes French and German chemists usually mean compounds formed entirely from artificial substances and aromatic products obtained by the manipulation of natural essences. The methods of preparing artificial perfumes are of great theoretical simplicity; but in practice they are exceedingly difficult of application. Indeed, the principles underlying the preparation of artificial perfumes are by no means well understood. For alcohols, Haller has shown that succinic anhydrides are to be preferred. In the case of ether, the resultant alcohol is saponified and then re-etherized by means of an acid combined with the essential oil. The alkaline bisulphites are used in the treatment of aldehydes and ketones, which are separated from the compound formed by means of an acid or alkali. For the phenols, potassium is used and the salt obtained is decomposed by means of an acid.

Among the more important nitrated derivatives, the first place should be given to the artificial musk invented by Albert Baur in 1888. This ingenious German chemist prepares his substitute for the costly natural musk by heating a mixture of isobutyl chloride and toluene with aluminum chloride. Water is added to the product of this reaction; the compound is subjected to distillation; and the distillates which pass over at a temperature between 107° and 200° C. are collected. These distillates are then treated with nitric and sulphuric acid; the product is washed with water, and when treated with alcohol yields crystals having a marked odor of musk. This same characteristic odor has been encountered in many of the benzenes. The compound most widely used in commerce is the compound invented by Baur, and the ketone musk which Malleman obtained by nitrating ketones with butyltoluene. More recently trinitro-butylxylene has been used as a substitute for natural musk. In the series of alcohols and ethers, terpineol should be mentioned. This compound is prepared by hydrating terpenes. Terpineol is much used by perfumers, by reason of its strong odor of syringa. It is often mixed with heliotropine, the two blending well. Cinnamic alcohol has the odor of hyacinth with a touch of rose; octyl alcohol has an odor closely resembling opoponax; nonyl alcohol, a mixture of orange and rose; ethyl butyrate, of pineapple; methyl salicylate, of wintergreen; amyl acetate, of pears; geranyl acetate, of rose geranium; benzyl acetate, of jasmine and ylang-ylang; linalyl acetate of bergamot; benzaldehyde, of bitter almonds. Among the phenols, thymol, discovered by Doveri in the essence of thyme, but also extracted from other essential oils, is of extreme importance. In obtaining this aromatic compound, the essential oil of *Ajowan ptychotis* is agitated with soda lye. The mixture is allowed to settle, and the liquor is then decanted. Employed as an antiseptic, thymol finds its chief value as an ingredient of medicinal soaps. In this connection its antiseptic power is 30 times that of carbolic acid. Vanillin is both an aldehyde and a phenol. Many ways have been devised for its preparation; but they are all more or less modifications of two methods—synthesis of benzene derivatives which are of slight scientific interest and the oxidation of natural compounds, which is of more importance from an industrial point of view. Vanillin is employed not only by perfumers, but also by bakers and cooks, as a substitute for the vanilla of nature. Up to the present time it must be confessed that artificial perfumes have not curtailed the production of natural oils and pomades. At first it seemed that synthetic perfumes would result in cutting down the price of the natural product. But experience has shown that artificial essences, by reason of their coarseness, have not been able to dethrone natural perfumes in popular favor. Scientists, ingenious though they may be, have not as yet completely succeeded in reproducing the delicacy of nature.

History.—Perfumes of various sorts have been held in high estimation from the most ancient times. The Egyptians prepared them for various purposes; for embalming the dead, as

offerings to the gods and for domestic uses. They anointed their bodies with sweet-scented oils, which they also poured upon the heads of newly-arrived guests. In the Bible frequent reference is made to the use of perfumes by the Hebrews. The Phœnicians, Assyrians and Persians are known to have made great use of them; Tyre was a famous mart where they were exported by sea, as Babylon was for the supply of the interior. The art was practised to an extraordinary extent by the Greeks and Romans. The odor of perfumes was an offering to the gods; after bathing and in their athletic exercises the Greeks applied them liberally to their persons. Their wines were perfumed by infusing in them roses, violets and hyacinths. Pliny gives a full account of the great variety of perfumes used by the Romans under the emperors. The use of perfumes was introduced by the Arabs into Spain. In the Middle Ages, France and Italy were most conspicuous for the use and manufacture of perfumes. Incense and fragrant tapers were consumed in the Church even as far back as the baptism of Clovis, 496. Charlemagne used perfumes and Philip Augustus granted a charter to the master perfumers in 1190. Alcoholic perfumes are supposed to have been first made in the 14th century; the first of these of which we have an account is Hungary water, distilled from rosemary in 1370, by Queen Elizabeth of Hungary, who received the receipt from a hermit, and by the use of it is said to have preserved her beauty to old age. When Catherine de' Medici went to France she was accompanied by a famous Florentine perfumer named René, and ever since that time the French have made great progress in the art. In Europe at the present time the manufacture of perfumes is carried on in Paris and London, and in various towns near the Mediterranean, especially in the south of France. Certain districts are famous for their peculiar productions; as Cannes for its perfumes of the rose, tuberose, cassia, jasmine and the neroli extracted from the leaves of the bitter orange; Nîmes for thyme, rosemary, aspic and lavender; Nice for the violet and mignonette; and Sicily for the lemon, bergamot and orange. England claims the superiority for her lavender and peppermint; these herbs being cultivated upon a large scale at Mitcham in Surrey and at Hitchin in Hertford.

United States.—The growing of flowers and plants for perfumes in the United States has made very slow progress. A start has been made in Florida by one or two flower-growers, and experiments with perfume grasses have been made by the government. In Michigan, Indiana and New York large areas are devoted to peppermint, spearmint and erigeron. Michigan, Wisconsin and Nebraska produce wormwood oil. Sassafras oil is made in many localities along the Atlantic seaboard, from Pennsylvania southward. The oils of wintergreen, black birch, spruce and cedar are made in some quantity in the North Atlantic States and also in Tennessee and Kentucky. Oil of pennyroyal is made in Ohio and North Carolina. Most of these, however, are for use as flavoring extracts rather than for perfumes.

Production.—According to the special census of manufactures taken for the year 1914, there were then in the United States 496 estab-

ishments making perfumes and cosmetics. They employed an aggregate capital of \$9,646,613 and 3,748,414 persons were engaged in the industry. Their product for the year reached a value of \$16,899,101, of which sum \$9,434,315 represented the value added by the manufacturing processes. Practically all of the raw materials were imported.

Imports.—Since the war began nearly all of the materials used in making perfumery have come from France. For the year ended 30 June 1917 there were brought in a value of \$406,136 in floral essences and \$418,774 in other odor-bearing substances. From the Philippines came a value of \$2,800. In addition to these raw materials there were brought in of ready-made perfumes, cosmetics, pastes, etc., a value of \$2,772,539. The duty laid upon such goods is extremely high, ranging from 60 per cent to 78.68 per cent, the total duty collected on the imported perfumes for that year totaling \$1,808,736. Including the essences, the value imported from France was \$3,357,235; from England, \$199,589; and from Switzerland, \$144,484. Those from other countries were insignificant.

M., 'Technique de la Fabrication des Parfums Naturels et Artificiels' (Lyons 1913); Otto, M., 'L'Industrie des Parfums d'après les Theories de la Chimie Moderne' (Paris 1909); Parry, E. J., 'The Chemistry of Essential Oils and Artificial Perfumes' (London 1908); Rimmel, E., 'The Book of Perfumes' (London 1867).

PERGAMUS, pēr'ga-mūs, or **PERGAMUM**, Asia Minor, an ancient city of Mysia, the modern Bergama, on the north bank of the navigable Caicus, about 15 miles from the sea. Behind the town, on a conical hill, rose the acropolis, which was the original nucleus of the place. It was founded by emigrants from Greece and was selected by Lysimachus as a safe depository for his great wealth; he placed here 9,000 talents of gold in charge of his lieutenant, Philetarus. The city first rose to importance about the commencement of the 3d century B.C., when it became the capital of an independent state of the same name, founded by Philetarus, who had revolted against Lysimachus. A succession of monarchs reigned over the city and territory till 133 B.C., when Attalus III bequeathed on his deathbed his kingdom to the Romans, and it subsequently became a Roman province. Under the Byzantine emperors the prosperity of the city rapidly declined. Pergamus was one of the most magnificent cities of antiquity and was principally indebted for its architectural splendors to Eumenes II, who likewise founded the celebrated library of Pergamus, containing 200,000 volumes; inferior in extent and value only to that of Alexandria. The city was famed for its manufacture of tapestries, pottery and precious ointments. It was also famous for its manufacture of parchment, which derives its name (*Pergamena charta*) from this place. In ecclesiastical history it is memorable as one of the seven churches of Asia referred to by Saint John (Rev. 2:12). Excavations carried out on the site in 1878-86 resulted in the dis-

covery of splendid architectural and sculptural treasures. The great library was removed by Antony and presented by him to Cleopatra.

The modern city of Bergama on the plain at the foot of the acropolis has a population of about 20,000 inhabitants. Consult Conze, A. C. L. (and others), 'Stadt und Landschaft von Pergamon' (Königliche Museum zu Berlin, 3 vols., 1912-13); Dörpfeld, W., 'Die Ruinen von Pergamon' (Athens 1902); Pontremoli, E., and Colignon, M., 'Pergame' (Paris 1900).

PERGOLESİ, Giovanni Battista, jō-vān'-nē bāt-tēs'tā pēr-gō-lā'sē, Italian musical composer: b. Jesi, near Ancona, 3 Jan. 1710; d. Naples, 16 March 1736. In the Conservatory of the Poveri di Gesù Cristo at Naples he was initiated by Gaetano Greco in the mysteries of his art, and while a pupil there composed his sacred drama 'San Guglielmo d'Aquitania,' produced in 1731. About this time he wrote in addition to several operas, a famous intermezzo, or operetta, 'La Serva Padrona,' whose original indifferent reception was Pergolesi's greatest popular success, but which later became the basis of all Italian comic opera up to Rossini's time. In 1734 he was appointed chapel-master of the church of Loreto. In 1735 he was invited to Rome to compose the opera 'd'Olimpiade' for the theatre Tordinone. It met with no applause, while Duni's opera of 'Nerone,' performed at the same time, and far inferior to it, was lauded to the skies. Ill-health compelled him afterward to take up his residence at Pozzuoli, where he finished his celebrated 'Stabat Mater.' In addition to the above works he composed masses, a 'Kyrie cum Gloria,' a 'Salve Regina' and other church music; 30 trios for two violins and violoncello; and 'Orfeo et Eurydice,' a cantata. His posthumous recognition was somewhat exaggerated; but his achievement, despite his general lack of science, was considerable. Consult the study by Schletterer (1880).

PERI, in Persian mythology, the descendants of fallen spirits excluded from paradise until their penance is accomplished. They belong to the family of the genii or jinn, and are constantly at war with the dævas (the evil jinn). In earlier times they were themselves considered evil. They are immortal and spend their time in all imaginable delights. They are male and female, the latter being of surpassing beauty. The legends of the peris and the dævas are Avestan in origin.

PERIAGUA, pēr-i-a'gwā. See PIROGUE.

PERIANDER, pēr-i-ān'dēr, Corinthian tyrant: d. about 585 B.C. He was a son of Cypselus, whom he succeeded about 625. His reign was at first mild but he soon developed into a tyrannous and oppressive ruler, though he was a patron of the arts and was reputed to be one of the Seven Wise Men of Greece. He prohibited the ownership of large numbers of slaves and luxurious habits and forbade the people from the country to live in the city. He put to death his wife Melissa, daughter of Procles, the tyrant of Epidarus, which circumstance when afterward related to her younger son Lycophron thoroughly alienated him from his father. Periander knowing Procles to have told his son of the mother's fate, thereupon

made war upon Epidarus, reduced it, and took Procles prisoner. He then endeavored to make peace with his son, who resided at Corcyra, and proposed to visit him, whereupon the Corcyreans put Lycophron to death in order to avert the visit. His rule extended over Corcyra, Ambracia, Leucas and Anactorium, beside his kingdom of Corinth. He was said to have died of a broken heart over his son's death.

PERIANTH, in botany, the floral envelopes, the calyx and corolla, or either, especially when the calyx and corolla are combined so that they cannot be satisfactorily distinguished from each other, as in the tulip, orchis, etc. See FLOWER.

PERIBONKA RIVER, Canada, an affluent of Lake Saint John, in the province of Quebec, over 400 miles long. It flows from about lat. 52° N., southward through a forest and lake region, Manóhan being the chief lake along its course.

PERICARDITIS, inflammation of the pericardium, the membrane enveloping the heart, essentially the same as inflammation of other serous membranes. It is either acute or chronic. In acute pericarditis the membrane is usually bright red with sometimes spots of ecchymoses and is covered with layers of soft or firm fibrinous exudation (false membrane) of varying thickness. Generally there is an effusion of flaky serum varying from a few ounces to a pint or more, which sometimes is sanguinolent. Rarely is pus present. If the serum is small in amount, or is absorbed, the sides of the pericardial sac adhere to each other in portions or entirely. Serum may distend the sac pulling apart adhesions into thread-like bands (hairy heart). Both serum and the exudate impede the action of the heart, especially if they are present in considerable amount. The principal causes of acute pericarditis are acute rheumatism and Bright's disease. It may also accompany pleurisy, pneumonia, erysipelas and the continued and eruptive fevers. Sometimes it results from penetrating wounds or contusions. An instance is recorded where a set of false teeth swallowed by an intoxicated man, causing ulceration of the œsophagus, was forced into the pericardial sac, pericarditis resulting. It occurs most often before the 25th year, rarely after the 45th, and in about one-sixth of the cases of acute rheumatism, is not, as popularly supposed, a transference (metastasis) of that affection, but a manifestation of it, due to the same condition of blood. When it appears in acute articular rheumatism, it occurs about the sixth day. The symptoms of acute pericarditis vary, depending on the amount of exudation and effused serum, and may be considered in connection with the three stages of the disease: (1) From the attack to the effusion, rarely beyond two days; (2) the stage of effusion; (3) stage of absorption. In the first stage there is more or less pain over the heart, increased by respiration; a shortened inspiration; generally a dry irritable cough and some tenderness; sometimes there is distress rather than pain. The action of the heart is increased; there is fever, anorexia and debility. When effusion occurs, pain and soreness are less. If there is much serum, symptoms of pressure upon the heart and irregular action of that organ appear,

with a feeling of weight, faintness on exertion, a feeble and irregular pulse, dyspnoea, a feeble voice, sometimes vomiting, dysphagia and mental disturbances. The detection of acute pericarditis is sometimes difficult, especially if associated with pleurisy or pneumonia. To the physician it is revealed by the precordial or cardiac friction-murmur, by an increased area of normal dullness, and by the exclusion of the symptoms of other affections. The prognosis varies with the extent and character of the inflammation and its products and also with the resisting powers of the patient. Sometimes the disease is mild and recovery occurs; often it is dangerous, death occurring in a day or two from paralysis of the heart, or within a week or two from impaired and, it may be, poisoned blood. Even if recovery takes place from a moderately severe attack, the action of the heart is usually impeded more or less for a variable time by the contracting fibrinous exudation. It must be borne in mind that very frequently endocarditis is associated with pericarditis. The treatment demands rest, soothing applications, freedom from excitement, and the relief of pain by remedies that do not disturb the heart's action or lower the strength of the body. Extensive serous effusion may have to be removed surgically.

Chronic pericarditis is usually one of the results of an acute inflammation following it after two or three weeks, but it may exist independently as a subacute affection from the outset. Generally there is little or no effused serum, but there are several layers of fibrinous exudation. Sometimes liquid distends the sac. Pus is rare. Usually there is little pain; but the heart is feeble; circulation is poor; dyspnoea is common, especially on exertion. If the lung is compressed, blood-tinged mucus may be expectorated. The prognosis is unfavorable because of the probability of repeated attacks, the likelihood that adhesions will form, and the presence of myocarditis. Suppurative pericarditis is nearly always fatal if associated with a general septicemia. The treatment of chronic pericarditis requires tonics, saline laxatives, and attention to hygienic measures.

PERICARDIUM, the investing fibro-serous sac or bag of the heart in man and other animals. In man it contains the heart and the origin of the great vessels. It lies behind the breast-bone, between the pleuræ and from the third to the seventh ribs. Its apex or smaller extremity is directed upward, and at this point it encloses the great blood-vessels about two inches above their origin from the heart. The base of the pericardium is fixed to the central tendon of the diaphragm or midriff. It rests upon the bronchi, the gullet and the descending aorta, behind; while the margins of the lungs overlap it in front. The sac consists of two layers, an outer or fibrous and an inner or serous layer. The fibrous layer is continued upward on the great blood-vessels, and gradually merges into their outer coats. Its inner or serous layer, which directly invests the heart, is reflected over the inner surface of the fibrous layer, and it therefore consists in reality of two layers or portions—a visceral portion, surrounding the heart, and a parietal portion, reflected on the fibrous layer. A single fold of the serous layer of the pericardium encloses the aorta and pul-

monary artery. The inner surface of the membrane secretes a serous fluid, which in health is present only in sufficient quantity to lubricate the heart, and so to facilitate its movements within the sac. Galen was familiar with pericardial effusion in animals and suspected it in man. In 1824 Collin discovered the pericardial friction rub from which the dry form of pericarditis is easily recognized. The pericardium of an adult man with a healthy heart is capable of holding from 14 to 22 ounces of fluid. The pericardium is liable to various serious forms of diseased action. Of these pericarditis (q.v.) is the most common. Others are hydropericardium, hemopericardium, pneumopericardium and new growths in the pericardium. See HEART.

PERICLES, pĕr'ī-klēz (Greek, Περικλῆς), Greek statesman, whose age was the most flourishing period of Grecian art and science: b. Athens, about 498 B.C.; d. there, 429 B.C. He was the son of Xanthippus and Agarista, both members of the best families of Athens, and the youth grew up in this choice environment. Damon, Anaxagoras and Zeno of Elea were his instructors. It was thought that from Anaxagoras Pericles derived the elevation and independence of mind and the remarkable eloquence which characterized him in his public life. In 469 he entered upon his career as a statesman. Up to this time only the nobler and more influential citizens had held control of the important offices. Pericles accomplished the absolute democratization of the state. At once he proclaimed himself champion of the people's party, in opposition to his friend Cimon, the aristocratic leader, and won favor by the legislation which he effected. Thus, he brought about the enactments that citizens serving as soldiers or as judges in the courts of the *Heliaea* should be paid, and that the public treasury should provide the two *oboli* charged for admission to the theatre at the *Dionysia* for such citizen as could not afford them. In 462-461, through Ephialtes, he introduced the measure by which the court of *Areopagus* was deprived of all those valuable political powers which made it antagonistic to his own success. Cimon was disposed of by being exiled, and conservative resistance was slight. Subsequently Pericles himself obtained the return of his opponent, who died at the siege of *Citium* in 449. For 30 years Pericles was undisputedly the foremost personage of Athens. Popular allegiance was strengthened by further changes. A salary was attached to the archonship, and in course of time the office was made accessible to all citizens. All officials were eventually salaried. Poorer citizens were established in holdings in the Athenian colonies. The foreign policy of Pericles was based on the purpose of making Athens supreme in Greece. In 445 he conquered the revolted island of *Euboea*; in 441-440 he subdued *Samos*, *Sophocles* being among the generals of the expedition. During the 10 years' interim preceding the *Peloponnesian War*, Pericles devoted his attention to increasing the maritime strength of Athens and to developing those plans of art which made Athens the wonder not alone of Greece but of the world. The funds obtained through the tribute of allies were applied to these designs. Among the temples and public buildings erected under

his administration were the *Odeum*, the *Propylaea* and that unapproached marvel of the architectural skill of *Ictinus*, the *Parthenon*. The impetus thus afforded to the fine arts was notable. *Phidias* directed the general work upon the edifices. But while his personal achievement was very great, it is evident that that age must have been well supplied with architects, plastic workers and decorators of admirable powers. The *Parthenon* sculpture, 50 colossal statues and 4,000 square feet of frieze and metope could not all have been done by *Phidias*, yet all is of about equal merit. These works diffused at Athens every sort of activity, and the consequent prosperity confirmed the influence of Pericles. The *Peloponnesian War* (q.v.) has been incorrectly ascribed to his ambition. Incorrectly, because, while he did urge resistance to *Lacedaemonian* demands, he did so because he saw that war was inevitable, and was convinced that as long as Athens retained the influence then possessed *Sparta* would never be content. At the commencement of the war (431 B.C.) Pericles recommended to the Athenians to turn all their attention to the defense of the city and to naval armaments rather than to the protection of their territories. Accordingly, as commander-in-chief, he allowed the superior forces of the Spartans and their allies to advance to *Acharnae*, in *Attica*, without resistance, and at the same time sent a fleet to the shores of *Peloponnesus*, to *Locris* and *Aegina*, which took twofold vengeance for the ravages in *Attica*. After the *Peloponnesians* retired he invaded the territory of *Megaris*, which had been the cause of the war. At the end of this campaign he delivered a eulogy over those who had fallen in their country's service. The next year a plague broke out at Athens which wrought such dreadful havoc that Pericles was obliged to summon all his fortitude to sustain his countrymen and himself. To occupy their attention he fitted out a large fleet and sailed to *Epidaurus*; but the mortality among his troops prevented him from effecting anything important. He returned with a small force; but the Athenians no longer put confidence in him. He was deprived of command and obliged to pay a heavy fine, though no particular crime was charged against him. The people, however, soon recalled him and gave him more power than before. He died of the pestilence after being 40 years the ruler of Athens—25 years with others and 15 years alone. Pericles maintained a reserve quite unwonted among Athenian statesmen. Such was his dignity, according to *Plutarch*, that "the epithet *Olympian*—attached to his name by a rash and thoughtless crowd—was 'a worthy and becoming title.' His oratory was very highly esteemed, and as a military commander he was able, though he did not particularly seek distinction in that field. His exalted position may be the more truly appreciated when it is remembered that he was the central figure of a group including such eminent personages as *Sophocles*, *Euripides*, *Æschylus*, *Socrates*, *Anaxagoras* and *Zeno*, and numbered also *Herodotus*, *Hippocrates*, *Democritus*, *Pindar* and *Empedocles* among his fellow countrymen. There is little doubt that his policy of personal government had for Athens injurious results. He had been the greatest man in the state, but had not encouraged a second; and at his death

democracy was helpless and a prey to demagogues. His lofty ideals, however, and their influence, became a permanent part of civilization. There are accounts of him by Plutarch and Thucydides. Consult also Abbott, Evelyn, 'Pericles, and the Golden Age of Athens' in 'Heroes of the Nations' (New York 1891); Lloyd, W. W., 'The Age of Pericles' (2 vols., London 1875).

PERICLES, Prince of Tyre. 'Pericles' is the only play now in the Shakespeare canon, which was not included in the 1623 Folio. It was, however, printed in quarto with Shakespeare's name on the title-page twice in 1609 and four times thereafter. There is no question that at least two authors, possibly three, collaborated in this drama, and modern criticism is agreed that one of these is Shakespeare, whose hand reveals itself distinctly at the opening of Act III, scene 1, if not earlier. Evidently Shakespeare created the poetical Marina scenes of the last three acts in the same spirit in which he created the Perdita scenes of 'The Winter's Tale' and the Miranda scenes of 'The Tempest.' Whether he wrote the coarse prose scenes of Act IV is more doubtful, but Fleay's effort to father them upon William Rowley rests on thin evidence. That they are utterly unlike Shakespeare or injudiciously introduced into the play cannot safely be asserted. Practically all the first two acts and the Gower speeches as a whole are now most usually ascribed (on Delius's suggestion, 1868) to George Wilkins, who in 1608 published a prose version of the story, frankly based upon the play. D. L. Thomas, however, who recognizes Shakespeare's touch largely in the first two acts and almost exclusively in the last three, argues interestingly for Thomas Heywood as the collaborator. *Engl. Studien* (XXXIX, 210-239, 1908). The story of 'Pericles' is one of the most popular and most ancient in mediæval literature. It is the subject of the last tale in Gower's 14th century 'Confessio Amantis' where it fills nearly 2,000 lines. The drama seems to be indebted to Gower and particularly to a more recent prose version in Lawrence Twine's 'Pattern of Painful Adventures' (licensed 1576). The hero is in most forms of the story called Apollonius of Tyre, the name Pericles in the play being possibly a reminiscence of Pyrocles, one of the chief figures in Sidney's 'Arcadia.' The exclusion from the first and second folios of a play of which six quarto editions between 1609 and 1635 claimed Shakespeare as author may be taken to prove that the poet repudiated the vitiated text we possess. There is no doubt, however, that 'Pericles' was an enormously popular work both on the stage and in printed form; and it is equally certain that it contains much fine Shakespearean poetry, quite typical of the author's latest style. In subject and dramatic method the play most resembles 'The Winter's Tale,' which likewise leaps over long times and distances and likewise deals with a king's ultimate recovery of his lost and supposedly dead wife and daughter. As it stands, 'Pericles,' with its long prologues and elaborate dumb-shows, its spectacular plot and continual shifting of scene through the entire Mediterranean world, reminds one, probably more than any other Elizabethan play, of the modern

moving-picture show. In a recent article 'On the Date and Significance of Pericles' (*Modern Philology*, XIII, 1916), T. S. Graves has shown that the Venetian ambassador in London probably sought to make diplomatic use of a performance of the play as early as the close of 1606, with the idea that the representation of the scene (I, 4) in which Pericles brings ships of grain to the relief of famine-stricken Tarsus would increase popular and royal favor for the project of securing English wheat for the use of Venice.

TUCKER BROOKE.

PERICLES AND ASPASIA, by Walter Savage Landor, was first published in two volumes in 1836; with numerous additions, in the Collected Works of 1846. It is a representation of Athenian society in the great age by means of a series of imaginary letters, in which are included several imaginary speeches by Pericles and abundant specimens of verse attributed to a great variety of Greek poets. Pericles, Alcibiades and Anaxagoras participate in the correspondence, but the bulk of it is carried on by Aspasia and her bosom friend, Cleone of Miletus. The two women are alike interested in literature and politics, and their relations are made piquant by the fact that Cleone loves Xenias, who follows Aspasia to Athens, and dies there of unrequited passion. To Cleone, Aspasia relates with sweet effusion her first glimpse of her hero, Pericles, at the theatre, whither she has gone in disguise to see the Prometheus of Æschylus acted; comments on current literature, art, morals, foreign affairs, war; describes a call from Sophocles, a reading by Thucydides, the marriage of Socrates; and exchanges with her friend bits of original verse. It would require a sensitive ear always to distinguish these fine bluestockings from one another or either from Pericles; for all the Greeks show a marked bias toward the terse, thoughtful, critical, sententious style of Landor. He apparently thought of his work as a kind of concentrated extract of the Periclean Age—its history and poetry redistilled by an independent English imagination in love with the glory that was Greece. It is one of the longest, most ambitious and, according to the judgment of his devoted admirers, one of the most successful of his efforts in prose—"perhaps the richest mine," says Sidney Colvin, "which English prose literature contains of noble and unused quotations." Consult Forster, John, 'Walter Savage Landor' (1869); Colvin, Sidney, 'Landor' in 'English Men of Letters.'

STUART P. SHERMAN.

PERIDINIUM; PERUTINIDÆ, respectively, a genus and a family of Dinoflagellate Protozoa at times coloring parts of the sea red. See RED WATER.

PERIDOT, a pale, yellowish-green or pistachio-colored variety of chrysolite (q.v.). It is used as a gem, but is soft and difficult to polish. In New Mexico and Arizona it is found abundantly in small grains or pebbles in the sands. From their form they are commonly known as 'Job's tears.' It is obtained also in Brazil and Egypt, and on an island in the Red Sea.

PERIDOTITE, pĕr'i-dō-tīt, a rock of which the essential constituent is olivine. It is

of ultra-basic composition, is free from quartz and feldspar, and is of igneous origin. With the olivine are associated more or less of the minerals augite, enstatite, magnetite, diallage, hornblende, chromite, and sometimes biotite. According to the kind of accessory mineral and its amount relative to the amount of olivine, the following varieties have been distinguished: dunite, saxonite, lherzolite, buchenerite, eulysite and picrite. Of these the first four appear in meteorites, as well as in terrestrial rocks, while the others have been discovered only in the latter. From the abundance of magnesia in the peridotites they are sometimes known as magnesian rocks. Their component minerals readily change by taking up water as the result of weathering into serpentine.

PÉRIER, pā-rē-ā, **Casimir Pierre**, French politician: b. Grenoble, 11 Oct. 1777; d. Paris, 16 May 1832. He studied at the Oratorian college in Lyons, and then in Paris; fought in Italy in 1795; became a partner in his brother's bank; and was very successful in his varied business ventures, soon becoming a director of the Banque de France. He was elected to the House of Deputies in 1817, and made his mark there as a financier, but especially as a conservative. He wrote against the means by which the duc de Richelieu attempted to obtain funds for the indemnity due the Allies. He sharply opposed the domestic policy of Polignac in 1829 and signed the 'Address of the 221.' He did not approve of the revolution of 1830 but acquiesced in it; served as minister in Lafitte's cabinet, but soon retired; in 1831 became Prime Minister, taking the portfolio of the interior; and in this office carried out what he called the "policy of the right mean" in domestic affairs, showing himself severe toward the republican opposition but insisting on his independence of the king — for instance in the matter of the meeting place of the cabinet, which he arranged should be at his home and not at the Tuileries. He regarded the stand of the king toward the mob as weak and too conciliatory. His foreign policy was "non-intervention"; but in 1832, in spite of the united opposition of the majority of his colleagues and the king, he sent an armed force to Ancona as a check on Austria's influence on the papacy. A naval demonstration at Lisbon was also carried out after the Portuguese government had refused compensation for certain injuries to French subjects. The awful cholera plague in Paris was met by strict sanitary measures devised by Perier and carried out under his personal supervision. In this work he was attacked by the plague, to which he fell a speedy victim, worn out as he was with overwork and anxiety. Consult Castille, 'Casimir Perier' (1859); and Nicoullaud, 'Casimir Perier, Député de l'Opposition' (1894).

PÉRIERS, pā-rē-ā, **Jean Bonaventure des**, French poet: b. Arnay-le-Duc, Bourgogne, about 1500; d. 1544. He collaborated in the first French translation of the Bible which appeared in 1534, he collaborated with Dolet in 'Commentaires de la langue latine' in 1536. He received favor from Marguerite of Navarre in 1536-37 but his ridicule of human institutions in 'Cymbalum Mundi' lost him all court favor. This work was publicly burned and Periers found himself a social outcast. It is said that

he committed suicide. An edition of his works was issued in Paris in 1866 and the year 1874 saw a special edition of the 'Cymbalum Mundi.'

PERIGEE, pēr'i-jē, that point in the orbit of the moon which is at the shortest distance from the earth. See MOON.

PÉRIGORD, pā-rē-gör, France, an ancient province forming part of the military government of Guienne and Gascony now represented by Dordogne and part of Lot-et-Garonne. See FRANCE.

PÉRIGUEUX, pā-rē-gē, France, capital of the department of Dordogne on the right bank of the Isle, 68 miles east-northeast of Bordeaux. The chief buildings are the 10th century church of Saint Etienne de la Cite, a Byzantine cathedral with a lofty tower and five small cupolas, built in 984-1047 and restored in 1865, a handsome modern prefecture, a courthouse, hospital, museum, library, barracks and theatre. The manufactures are bombazine, serge, hosiery, cutlery, nails, pottery, liqueurs, spirits, leather; many hands are employed in cutting and polishing marble. One article of trade is the famous partridge and truffles (*bâtes de Périgueux*). Périgueux is the Vesuna of Cæsar, and near the town are the remains of a vast amphitheater, of ancient aqueducts, baths and temples. The completely destroyed Vesuna of the Petrorians, who first inhabited this district, was somewhat further south than the present town; the Vesuna of the Romans is that part of the town now known as *la Cité*. The Tour de Vésonne is a remarkable Roman structure, 67 feet high and 200 feet in circumference, with neither door or window. Périgueux was one of the eight towns ceded to the Protestants in 1576.

PERIHELION, in astronomy, that part of the orbit of the earth or any other planet in which it is at the point nearest to the sun. The "perihelion distance" of a heavenly body is its distance from the sun at its nearest approach.

PERIM, pā-rēm', British island in the Strait of Bab-el-Mandeb, 12° 40' N. and 43° 23' E., two miles from the Arabian coast and 12 miles from Africa. It has neither water nor vegetation and the entire island (about six square miles) is merely the remains of a great volcano. It was seized for the second time by the British in 1857, in spite of the protest of nearly all the Powers; has a fortress and light-house, built in 1861, and a small garrison; and is a key to the Suez Canal. The harbor is excellent.

PERINÆUM, or **PERINEUM**, the outlet or floor of the pelvis, comprising muscles, blood-vessels, nerves, the lymphatic glands, the anus and a portion of the vagina in females and the genital apparatus in males. It is somewhat triangular in shape and is bounded by the rami of the pubes and ischia, the tuberosities of the ischia, the sacro-ischiatic ligaments and the apex of the coccyx. The portion between the pudendum and the anus is sometimes called the anterior perinæum, or triangle, and that between the anus and coccyx the posterior or triangle. The perinæum is sometimes ruptured or torn during the birth of a child, especially in primiparæ, and is sometimes the seat of

operation for the removal of a stone from the bladder (perinæal lithotomy). Stone in the bladder in children can often be diagnosed through the rectum and, if the whole hand is introduced, the entire pelvis may be explored. Consult Shepherd, Francis J., 'Anatomy of the Perinæum' (in 'Reference Handbook of the Medical Sciences,' New York 1916).

PERIOD, in geologic chronology, a time interval the value of which has been variously interpreted. The special committee of the International Congress of Geologists at the Bologna meeting in 1881 recommended the use of the term period for the time division of second magnitude, that for the first being *era*. The rocks formed during this time period were to be grouped as a system. According to this usage we should have Cambrian, Ordovician, Silurian, Devonian, etc., periods. In this sense the term is used by the United States Geological Survey. Dana on the other hand uses *era* for this time division, giving *period* a subordinate rank—as Niagara period, Onondaga period, Lower Helderberg period. The New York State Survey uses the term in nearly this sense but emphasizes more especially the threefold division of each era, that is, early, middle and later Devonian periods, or early, middle and later Cambrian periods. The dual nomenclature of geologic classification, that is, the separate grouping of the time divisions and of the corresponding rock divisions was first strongly urged in this country by Prof. Henry S. Williams of Cornell (late of Yale). He also proposed the use of the prefixes *eo*, *meso* and *neo* for the periods. Thus he uses *Eosilurian*, *Mesosilurian* and *Neosilurian* periods. The New York State Survey has adopted these terms with the substitution of *palæo* for *eo*. Consult Williams, 'The Making of the Geological Time Scale' (*Journ. of Geol.* I, 180-197); 'Dual Nomenclature in Geological Classification' (ib., II, 145-160); 'Geologic Biology' (1895); Clarke and Schuchert, 'The Nomenclature of the New York Series of Geologic Formations' (*Science*, 8 Dec. 1899), and *American Geologist* (February 1900). PERIODIC LAW, in chemistry, the law which teaches that the properties of the elements are periodic functions of the atomic weights; so that when the elements are arranged in the order of increasing atomic weights, similar properties recur periodically, as we proceed from one end of the array to the other. It had long been known that certain approximate numerical relations exist among the atomic weights of elements that have strikingly similar properties. For example, if we consider the three closely related elements lithium, sodium and potassium, we find that the atomic weight of sodium is almost exactly the arithmetic mean between the other two. Thus $\text{Li} = 6.94$ and $\text{K} = 39.10$, the mean of which is 23.02; and the atomic weight of sodium is 23.00. Again, in the triad calcium, strontium and barium, we have $\text{Ca} = 40.07$ and $\text{Ba} = 137.37$, the mean of which is 88.72; and the atomic weight of strontium is 87.63. The triad chlorine, bromine and iodine affords still another familiar example, for we have $\text{Cl} = 35.46$ and $\text{I} = 126.92$, giving a mean of 81.19; and the

atomic weight of bromine is 79.92. These relations, of whose precise significance we are still ignorant, forcibly suggest a relationship among the elements, similar (for example) to that prevailing among the paraffins in organic chemistry; for the paraffins all have analogous properties, and their molecular weights form an arithmetic series. In 1862 De Chancourtois conceived the idea of arranging all of the known elements along a helix, each element being represented by a point, whose distance from some fixed point, as measured along the helix, was numerically equal to the atomic weight of the element. He chose the unit of measurement, to be used in laying off the positions of the various points, so that a difference of 16 in the atomic weights of two elements corresponded to a complete turn of the helix. He then endeavored to show that similarity in properties in any group of elements corresponds to some simple geometric relation among the representative points. Chlorine, bromine and iodine, for example, are represented by points that lie sensibly upon a straight line parallel to the axis of the helix. De Chancourtois was primarily a mathematician and geologist, and his contribution to chemical science did not receive the attention that it merited until many years had elapsed. In 1864 and 1865, Newlands published two papers in which he exhibited the elements in a tabular array, following the order of increasing atomic weights approximately, but not without some slight transpositions. He pointed out that the elements in his scheme fall into groups, and he likened the members of each group to the notes composing one octave in music, calling the regularities which he pointed out the "law of octaves." In March 1869, Mendeléeff read a paper before the Russian Chemical Society, in which he examined the whole subject with great thoroughness, investigating the way in which various properties of the elements change with the atomic weights. His general conclusion was, that the measureable properties of the elements do not, as a rule, increase or decrease continuously as the atomic weights increase, but that they exhibit a species of periodicity, increasing and decreasing alternately, though apparently not with sufficient regularity to admit of representation by a definite mathematical expression. In 1870 Lothar Meyer, independently of Mendeléeff, published an important paper on the same subject, in which he showed that the periodicity of the "atomic volumes" of the elements is especially marked; "atomic volume" being defined as the quotient obtained by dividing the atomic weight of an element by the specific gravity of the element in the solid state. Meyer's diagram, with some changes and additions to bring it down to date, is presented in the accompanying engraving. The atomic weights of the elements are here laid off along a horizontal line, or "axis," and the corresponding atomic volumes are laid off vertically, according to the scale given at the left. In this way a series of points is obtained, corresponding to the respective elements; and through these points a broken line has been drawn, so that as we proceed along the line from left to right we pass the different elements in the order of ascending atomic weights. The specific gravities of some of the elements, in a solid state, are not known, and those of

others (such as nitrogen) are more or less uncertain, owing to the great experimental difficulties involved in their determination. Without doubt, therefore, Meyer's diagram will be still further modified, as our knowledge of the physical properties of the elements increases. There are five regions in the diagram, for which we possess no acceptable data concerning the specific gravities in the solid state, and for which, therefore, we do not know the atomic volumes. These regions are indicated by the dotted lines. In two places, also, the line passing through the representative points does not strictly follow the order of increasing atomic weights. Argon (A), for example, appears to have an atomic weight slightly greater than that of potassium (K), and yet there seems to be no doubt but that argon should precede potassium as we pass along the broken line to the right. Argon forms no compounds, and its atomic weight is known only by inference from its density; so that this trifling irregularity can hardly be considered serious. Again, tellurium (Te) precedes iodine (I) on the diagram, although the diagram shows the atomic weight of tellurium to be the greater by a trifling amount. The atomic weight of tellurium, however, is still more or less uncertain. According to some authorities, it is actually less than that of iodine, so that the slight discrepancy here shown disappears altogether.

It will be seen that the broken line exhibits a marked tendency to vary in height in a periodic manner, now rising to a strongly accentuated maximum height, and again sinking to a minimum that is less distinctly emphasized. The irregularities are doubtless due in part to the imperfection of our data; but many of them,

to are those corresponding to magnesium (Mg), calcium (Ca), strontium (Sr) and barium (Ba), which also form a group with markedly similar properties. If we pass downward to the left from the highest points, we first come to the group neon (Ne), argon (A), krypton (Kr) and xenon (X) which are distinguished by their singular chemical inertness. Beyond these, on the left, comes the group fluorine (F), chlorine (Cl), bromine (Br) and iodine (I); and next beyond these come oxygen (O), sulphur (S), selenium (Se) and tellurium (Te). Many other singular correspondences may be observed on the diagram; and as it is highly improbable that these are merely accidental, we must conclude that some fundamental unity, either of structure, material or internal motion, pervades the substances that we call "elements."

Mendeléeff (and Meyer also) arranged the elements in tabular form, in such a way as to bring out their correspondences quite clearly. Mendeléeff's arrangement (with some modifications and additions) is presented herewith. The elements, it will be seen, are divided into nine groups, each of which is entered in a separate column. They are also divided into 12 "series" each of which is entered upon one horizontal line. The atomic weights increase across the table from left to right. The elements in any one column are similar to one another in many ways, the resemblance being sometimes very striking. Hydrogen does not properly fit into the table at all. Copper, silver and gold, it will be seen, are entered both in the first group and in the eighth one. This is because their true positions are doubtful, some considerations indicating the first group, while others point equally well to the eighth. The eighth group is an

without doubt, are real and due to causes that we cannot yet understand. At the highest points of the diagram we find the metals of the alkalis—sodium (Na), potassium (K), rubidium (Rb) and caesium (Cs)—whose physical and chemical properties are strikingly similar. Passing down the line to the right of these several elements, the first points that we come

anomalous one at best, for the metals that compose it are so similar that it appears necessary to arrange them in threes (or fours), each little group of this kind being considered as lying upon one and the same horizontal line of the table. Between cerium and ytterbium in atomic weight there are a number of closely-allied metals, the metals of the rare earths, which do

not fit into the periodic system in any natural manner, and are omitted from the table. In any given group, the elements of the even series (2, 4, 6, 8, 10 and 12) resemble one another, as a general rule, more closely than they resemble those in the odd series of the same group; this fact (which is not true in all parts of the table) is indicated by indenting the odd and even series differently.

The full significance of Mendeléeff's table cannot be understood without an exhaustive study of the chemical deportment of the elements classified. At the top of the table, and immediately under the group number, formulæ are given which indicate the character of the compounds that the elements of the corresponding group form when combining directly with hydrogen. Thus, in combining with hydrogen alone, carbon yields the saturated compound CH_4 ; nitrogen yields NH_3 ; oxygen yields OH_2 ; and fluorine yields FH . The elements of groups I, II and III, either do not combine directly with hydrogen, or they form compounds which are unstable; and the elements in group IX do not form any compound at all. Most of the elements combine with oxygen in more than one proportion; but there is usually one oxide which may be regarded as characteristic of the element. The formulæ of these oxides for the different groups are given in the second line under the group number. In some cases the general formula for the oxide does not correspond to the particular oxide that is commonly regarded as typical of the element in question. The oxides of manganese, for example, are analogous to those of lead in many respects; and yet manganese appears in the seventh group and lead in the fourth. But it should be observed that manganese has an oxide of the form Mn_2O_7 , while lead has not so far as is known; and in this sense, at least, the oxide R_2O_7 may be said to be characteristic of manganese. The oxides of group VIII do not, in general, correspond to the typical formula RO_4 ; though osmium and ruthenium have oxides of this form. It must be remembered, throughout, that the "periodic law" is more or less elastic, and that in classifying the elements in groups we have to consider their properties as a whole, and not simply some one of them, nor some few. In Mendeléeff's arrangement, for example, attention has been paid to the melting points, boiling points, spectra and magnetic properties of the elements, as well as to the colors and heats of formation of their salts. Other physical and chemical properties have likewise been examined in the light of the "periodic law," and the arrangement here suggested is that which appears to best represent the entire mass of relationships.

It is evident that if an erroneous atomic weight were assigned to any element whose place in the periodic scheme is definitely fixed by its general physical and chemical properties, the error would be detected if it were great enough to transfer the element in question to a position already occupied by another element, or to a group in which it manifestly did not belong. Several instances could be given in which a disagreement of this kind has led to further research, followed by the improvement of the atomic weight of an element in the direction indicated by the periodic law. The atomic

weight of titanium, for example, was formerly taken as 52, this being the result indicated by actual analysis of its compounds. But with this atomic weight it did not fit into the general classification, which called for an atomic weight of about 48. Thorpe, by a new investigation, showed that 48 is correct. The order in the table, however, of tellurium and iodine, and of argon and potassium, is not the order of their atomic weights.

Mendeléeff found it impossible to construct his table without leaving many of the spaces in it vacant. He considered these vacancies to correspond to elements which were not then known, but which would probably be discovered in the future. In 1871 he wrote a paper upon this subject, in which he essayed to predict the general properties that three of these unknown elements must have, in order to fit well into the periodic scheme. It is gratifying to record that he has lived to see all three of them discovered, and to know that his predictions have been verified with extraordinary accuracy. The metals so predicted are now called "gallium," "scandium" and "germanium," respectively, for the three countries (Gallia, Scandinavia and Germany), in which the rare earths containing them were discovered. His predictions for scandium (which he provisionally called "eka-boron" from its position in the table, and denoted by the symbol Eb), may be compared with the actual properties of that metal in the following manner:

EKA-BORON (hypothetical).

1. Atomic weight about 44.
2. Oxide will have formula Eb_2O_3 ; will be soluble in acids, but insoluble in alkalis; specific gravity of oxide about 3.5; analogous to Al_2O_3 , but more basic; less basic than MgO .
3. Salts of Eb will be colorless, and will yield gelatinous precipitates with KOH , K_2CO_3 , Na_2HPO_4 etc.
4. Sulphate will have the formula $\text{Eb}_2(\text{SO}_4)_3$ and will form, with K_2SO_4 , a double salt which will probably not be isomorphous with the alums.

SCANDIUM (actual).

1. Atomic weight 44.
2. Oxide has formula Sc_2O_3 ; is soluble in strong acids, but insoluble in alkalis; specific gravity of oxide = 3.8; analogous to Al_2O_3 , but more decidedly basic.
3. Solutions of Sc salts are colorless, and yield gelatinous precipitates with KOH , K_2CO_3 , and Na_2HPO_4 .
4. Sulphate has the formula $\text{Sc}_2(\text{SO}_4)_3$, and forms, with K_2SO_4 , the double salt $\text{Sc}_2(\text{SO}_4)_3 \cdot 3\text{K}_2\text{SO}_4$, which is not an alum.

Of the discovery of the periodic law, whose antecedents are briefly mentioned above, Mendeléeff says: "Neither De Chancourtois, to whom the French ascribe the discovery of the periodic law, nor Newlands, who is put forward by the English, nor L. Meyer, who is now cited by many as its founder, ventured to foretell the *properties* of undiscovered elements, nor to alter the 'accepted atomic weights,' nor, in general, to regard the periodic law as a new, strictly-established law of nature, as I did from the beginning (1869)." He claims the discovery of the law for himself, on the ground that it was he who first established it in such a way that it can be used to correct the results of direct observation, to predict new elements and their properties, and (in his own words) to "permit the invisible to be seen, and the unknown known."

One of the most interesting things about the periodic law is that it appears to indicate a finite limit to the number of elements existing. Thus if all the vacant spaces in the table were filled, the number of elements would still be less than 120. It does not appear probable that other ele-

ments will be discovered whose atomic weights are less than that of hydrogen. On the other hand, it appears from considerations entirely foreign to the periodic law that elements having atomic weights materially greater than that of uranium would not be stable. Modern research indicates that radium, thorium and uranium are all on the verge of instability, and perhaps just over the verge.

The modern explanation for the phenomena summed up by the periodic law is that the atom is a system of very small negative electrons (q.v.) in a relatively large sphere of positive electrification, that the atomic weight is proportional to the number of electrons in the atom and that the stable arrangements of electrons are in a general way periodic functions of the number of electrons to be arranged.

For detailed information regarding the periodic law, consult Garrett, 'The Periodic Law' (London 1909); Huth, 'Das periodische gesetz der atomgewichte' (Frankfurt 1884); Meyer, Lothar, 'Modern Theories of Chemistry'; Mendeléeff, 'Principles of Chemistry' (3d English ed., London 1905); Newlands, 'On the Discovery of the Periodic Law' (London 1884); Ramsay, Sir W., 'Modern Chemistry' (New York 1901); Richardson, 'The Electron Theory of Matter' (Cambridge, England, 1914); Venable, 'A Bibliography of the Periodic Law' (Easton, Pa., 1896).

PERIODICAL LITERATURE. In the general acceptance of the term a periodical is any publication other than a book or a daily newspaper. Usually the term comprises those serial publications the principal object of which is the circulation of interesting essays, tales, poems and useful information of a literary, scientific or artistic character. Periodicals are, furthermore, generally distinguished from newspapers by the greater care and reflection commonly bestowed upon their articles, and by their shape, which is always such that the numbers may be easily and conveniently bound and preserved in the form of books. Periodical literature embraces various classes of publications, those devoted to literature or criticism, and others to the sciences, the arts, or to special branches of knowledge or politics. Periodicals exclusively devoted to criticism are generally called reviews, and those whose contents are of a miscellaneous and entertaining kind magazines; but there is no great strictness in the use of the terms. The spread of knowledge during the 18th and 19th centuries, and the multiplication of books rendered it impossible for the scholar to inform himself of the progress of learning in various countries, or to purchase and read more than a small portion of the works published; hence the necessity for critical serials, magazines and other productions in the field of periodical literature. In the United States and in Great Britain most periodicals are issued weekly, monthly or quarterly. In France, Italy and Belgium the fortnightly is regarded as the natural form of the high-class periodical. Outside these countries the fortnightly is practically unknown. In Russia, Germany, Scandinavia and in Spain and Portugal the periodicals are generally monthly. The periodical had its genesis in France in 1665, and Italy and Great Britain followed soon afterward. But rather than deal with the sub-

ject chronologically, it would seem better for the sake of convenience to tell the life history of the periodical by an arrangement into the principal countries.

American periodical literature dates from 1741, the year when Franklin issued the *General Magazine and Historical Chronicle* at Philadelphia; but it existed only six months, while the *American Magazine*, begun a few days earlier by Andrew Bradford and John Webbe, was still less successful, running no further than two monthly numbers. The *Boston News-Letter* (1704), the first newspaper in America, was a weekly until 1776. The other issues of the kind prior to the Revolution were the *Boston American Magazine and Historical Chronicle* (1743-47), the *Boston Weekly Magazine* (1743), the *Independent Reflector* (New York 1752-54), the *New England Magazine* (Boston 1758), which ceased after a few issues, the *American Magazine* (Philadelphia 1757-58), the *North American Magazine* (Woodbridge, N. J., 1758), the *American Magazine* (Philadelphia 1769), the *Royal American Magazine* (Boston 1774), and the *Pennsylvania Magazine* (Philadelphia 1775). Before the end of the century came the *Columbian Magazine* (Philadelphia 1786), the *American Museum* (1787), the *Massachusetts Magazine* (Boston 1789), the *New York Magazine* (1790), the *Farmer's Weekly Museum* (Walpole, N. H., 1793), the *United States Magazine* (Philadelphia 1796), the *American Universal Magazine* (ib. 1797), and the *Monthly Magazine and American Review* (New York 1799-1800), founded by the novelist Brown, but carried on afterward as the *American Review and Literary Journal* (1801-02). Early in the 19th century came the *Port Folio* (Philadelphia 1801-27), founded by Joseph Dennie; the *Literary Magazine and American Register* (ib. 1803-08); the *Anthology and Boston Review* (1803-11), the forerunner of the *North American Review*; the *Monthly Register* of Charleston (1805) was the first periodical produced in the South. Altogether there were 27 periodicals appearing in the United States during 1810. The *Analectic Magazine* (Philadelphia 1813-20) was for a time edited by Washington Irving; the *New York Weekly Museum* appeared in 1814, but it was not till 1824 that the first periodical worthy of the city was founded in the *Atlantic Magazine*, which soon became the *New York Monthly Review*. The *New York Mirror* (1823-42) counted N. P. Willis among its editors; *Graham's Magazine* (1840-50) enjoyed a large circle of readers; the *Knickerbocker* (New York 1833-60) rose to great influence and prosperity. The *Southern Literary Messenger* (Richmond 1834) was a vehicle for some of Poe's finest criticism. The *Dial* (Boston 1840-44), the mouthpiece of the Transcendentalists, was edited successively by Margaret Fuller and Emerson; the *Illinois Monthly Magazine* (Vandalia 1830-32) was the first Western periodical, principally the work of one man, James Hall, who later for three years conducted the *Western Monthly Magazine*. The *Independent* started in 1848 and absorbed *Harper's Weekly* in 1916. *Putnam's Monthly Magazine* ran with great popularity in New York from 1853 to 1870, when it merged into *Scribner's Monthly*, which later became the *Century*

Magazine. *Putnam's* was revived in 1906, combining with the *Critic* and *Literary World* as *Putnam's Monthly*, which was merged into the *Atlantic Monthly* in 1910. The last-named dates from 1857 (Boston); in 1878 it absorbed the famous *Galaxy*, which was founded in 1866 and had numbered Whittier, Longfellow, Lowell and Howells among its contributors and editors.

The review literature of the United States begins with the *American Review of History and Politics* founded by Robert Walsh (q.v.) in Philadelphia in 1811, a quarterly which existed two years; but one of the ablest and most permanent publications of this type has been the *North American Review* (1815), which has constantly maintained a high character both in style and critical excellence. The *General Repository and Review* (Cambridge 1812-13) had a very brief career, while Niles's *Weekly Register* (Baltimore 1811) ran till 1849. The *American Quarterly Review* (Philadelphia 1827-37) was another enterprise of Robert Walsh; the *Southern Quarterly Review*, an organ of Southern politics, ran from 1828 to 1832; revived in 1842, it existed till 1857 at Charleston, S. C. Other periodicals were the *Democratic Review* (1837-51), which absorbed the *Boston Quarterly Review* in 1842; the *American Review* (1845-49), which became the *American Whig Review* in 1850 and ended in 1852; the *Massachusetts Quarterly Review* (Boston 1847-50); *Lippincott's Magazine of Literature, Science and Education* (1868-71) underwent a slight alteration in title in 1871 and 1886 and was absorbed by *Scribner's Magazine* in 1916. The last-named periodical dates from 1887, and must not be confused with the former *Scribner's Monthly*, since 1881 known as the *Century Magazine*. A remarkable publication was *Brownson's Quarterly Review* (Boston 1844-56 and New York 1856-75), founded and conducted throughout its career by the late Orestes A. Brownson (q.v.) after severing his connection with the *Boston Quarterly Review*. The *Catholic World*, devoted to general literature and science, has appeared in New York since 1865, in which year the important weekly *Nation* also was first issued. The *National Quarterly Review* (New York 1860-80) and the *New York International Review* (1874-83) were popular in their day. A successful career was that of *De Bow's Commercial Review*, established in New Orleans in 1846, which under different sub-titles and after several breaks in continuity of issue ended in 1870. Still later appeared the *Arena* (Boston 1889-1909); *Cosmopolitan* (New York 1886); *Forum* (ib. 1886); *McClure's Magazine* (ib. 1893); *New England Magazine* (the third of that name, Boston 1884); *Overland Monthly* (San Francisco 1868); *Munsey's Magazine* (1884-85); *Everybody's* (New York 1899); *Metropolitan*; *Review of Reviews* (American edition, 1890); *Collier's Weekly* (1888); *Harper's Monthly* (1850) and *Harper's Weekly* (1857-1916); *Leslie's Weekly* (1855) and *Leslie's Monthly* (1876), now the *American Illustrated Magazine*; *The Outlook* (formerly *Christian Union* from 1870-93); *Saint Nicholas* (1873); *Youth's Companion*; *Country Life in America* (1901); *Woman's Home Companion* (1873); *Ladies' Home Journal* (1883); *Pictorial Review* and a host of other popular periodicals.

Increased revenue from advertisements enabled publishers to improve style and quality by enlisting highly-paid literary and artistic skill. The excellence of the illustrations to be found in American magazines is unsurpassed, while the stories and articles are with rare exceptions of a high order. The resuscitated *Munsey's Magazine* (as a weekly publication, in 1889) led the way in popularizing this form of literature. In not a few cases the intrusion of commercialism has led to a chaotic system of "make-up," by which connected articles and stories are split up and scattered with columns and even pages of advertisement intervening.

The serious reviews cover almost every branch of topical and intellectual interest—art, science, engineering, history, commerce, industrialism, law, theology and medicine. Practically all the learned societies and educational institutions have their "journals" or "reviews." Within recent years a number of new and original periodicals have appeared. *The Unpopular Review* (1914), a high-class publication of extraordinary merit, represents an accessible asylum for unpleasant truths and opinions; *World's Work*, *Review of Reviews* and *Literary Digest* are indispensable for the student of contemporary events. The publication by the *New York Times* of the monthly *Current-History* (1914), dealing with the European War, struck a new note in periodical literature by reproducing only authentic records without any comment. Among the latest periodicals may be mentioned *The Review* (New York 1919), a weekly devoted to political and general discussion; *Reconstruction: A Herald of the New Time* (New York 1919); *Harvey's Weekly* (1918) and *The Journal of Industrial Hygiene* (New York 1919), the first periodical devoted to the various phases of social and individual welfare included under that head.

Australia.—The British periodicals circulate largely in Australia. Chief among the native products are the quarterly *Imperial Review* (Melbourne), another of the same name published in Sydney; the *Australian Review of Reviews*; and the *Monthly Review* of New Zealand. In the large cities appear several illustrated topical weeklies, sporting journals and religious magazines.

Belgium.—From 1772 to 1818, the *Esprit des Journaux*, a literary miscellany of considerable value, was published in Belgium, but it was not until the separation from Holland (1829–31) that a distinctive periodical literature appeared. In early years of the 19th century the *Messages des Sciences* was edited by Saint Genois, while the *Nederdeutsche Letteroefeningen* appeared in 1836. Willems (q.v.) edited the *Belgisch Museum* from 1836 to 1846. The modern reviews cover the usual spheres of literature, science, history, politics, etc. See BELGIUM, *Newspapers and Literature*.

Canada.—To a large extent Canada depends upon the mother country and the United States for her periodical literature. Among the principal native publications are the *Canadian Magazine of Politics, Science, Art and Literature* (Toronto 1893); *Canadian Institute Transactions* (1852) and a large number of agricultural, engineering, mining and industrial publications. Several religious journals are published in Toronto and Montreal. *The By-*

stander, a unique magazine edited, written and owned by the late Goldwin Smith, and *Once-a-Week* were shortlived Toronto publications.

England.—With the possible exception of the *Philosophical Transactions of the Royal Society*, which first appeared in 1665, the earliest English periodical seems to have been the *Weekly Memorials for the Ingenious*, the first number of which is dated January 1681. It was followed by several other periodicals, the most noteworthy being the *History of the Works of the Learned* (1699–1711); the *Memoirs of Literature* (1709, continued under different titles till 1743). The famous *Gentleman's Magazine* was founded in 1730. In the same century the nearest approach to the review, as differing from the magazine proper, was made by the *Monthly Review* (1749–1844), which was followed by the *Critical Review* (1756–1817); to which Smollett largely contributed; the *British Critic* (1793–1843); the *Anti-Jacobin Review and Magazine* (1798–1821). In 1809 appeared the *Quarterly Review*, successively edited by Gifford, Coleridge and Lockhart, who were assisted by the contributions of Scott, Southey, Croker, Heber, etc., who wrote in the Tory interest. In 1824 the *Westminster Review* was started by Bentham as the organ of utilitarianism and radicalism in politics, and has numbered among its contributors Bowring, Grote, Carlyle, John Sterling, Mill, Bain, etc. To provide critical literature at shorter intervals there was started in 1865 the *Fortnightly Review*, which for a short time appeared twice a month, since then only once. It was followed by the *Contemporary Review* (1866) and the *Nineteenth Century* (1877—since 1901 the *Nineteenth Century and After*). Among the more recent periodicals of this class are the *National Review* (1883), a Conservative organ; the *Review of Reviews* (1890), giving analyses of the current periodicals generally; the *New Century Review* (1897); and the *Monthly Review* (1900). The *Athenaeum* (1828) and the *Academy* (1869) are weekly journals devoted to the criticism of new books, paintings and sculpture, music and dramatic works and performances, with information on matters connected with literature, science and art. The *Saturday Review*, *Spectator* and *Speaker* (all weekly) combine the character of the review proper with more or less of that of the newspaper. The first English magazine, properly speaking, may be said to be the *Gentleman's Journal*, or *Monthly Miscellany*, commenced in 1692. The well-known *Tatler* (1709–10), *Spectator* (1711–12, revived 1714) and *Guardian*, as well as Johnson's *Rambler* (1750–51), were periodicals of a special kind. In 1731 appeared the *Gentleman's Magazine*, published by Cave, and contributed to by Johnson and other eminent writers. It brought a fortune to the lucky publisher, at whose death it was continued by Henry and Nichols. The success of Cave's venture brought out a host of imitators. The *London Magazine* (1732–84), the *European Magazine* (1782–1826) and the *Monthly Magazine* (1796–1829) were among the chief of this class which were originated in the 18th century. In 1832 *Chamber's Journal* made its appearance, marking the commencement of a new and more popular era. It was published

weekly, but was also issued in monthly parts. *Cassell's Family Paper* (now known as *Cassell's Family Magazine*) was started in 1853. The old *Penny Magazine* (1832), published by the Society for the Diffusion of Useful Knowledge, deserves honorable mention. It was succeeded by the *Leisure Hour* in 1852, still one of the best illustrated sixpennies, published by the Religious Tract Society. Charles Dickens founded *Household Words* in 1850, and *All the Year Round* in 1859. A new era in this kind of literature was inaugurated by the shilling monthlies, some of them with excellent illustrations, the first being *Macmillan's Magazine* (1859); *Cornhill Magazine* (1860); *Temple Bar* (1860); closely followed by a number of others. Another step in the direction of cheapness was shortly afterward made by the publication of monthly magazines at sixpence, including *The Argosy*, *Good Words*, the *Sunday Magazine*, etc., followed at a long interval by *Longman's Magazine*, *Murray's Magazine*, *English Illustrated Magazine* (1883); *Strand Magazine* (1891); *Idler* (1892); *Woman at Home* (1893); *Windsor* (1895); *Englishwoman* (1895); *Lady's Realm* (1896); *Pearson's Magazine* (1896); *Temple Magazine* (1896); *Girl's Realm* (1898); and *Wide World Magazine* (1898). Threepenny and fourpenny monthly magazines have become prominent in recent years. *Cosmopolis* (1896) has sections in French and Italian. There are innumerable religious magazines. The *Jewish Quarterly* is read by many who are not Jews. The *Empire Review* (1901) deals entirely with Imperial affairs. The *United Service Magazine* is a monthly, the *Navy and Army* a weekly. The *Badminton* is devoted to sport.

The European War was responsible for a number of new periodicals, such as the *Landmark* (1919), the monthly magazine of the English-Speaking Union; the *Balkan Review* (1919); the *New Europe* (1916), a valuable weekly; the *Anglo-French Review* (1919) represents life and letters in the two languages; the *New Poland* (1919); the *New World* (1919) aims to strengthen the bonds of permanent friendship among all the allied and associated peoples; the *Reveille* (1918), devoted to the disabled soldier and sailor; and the *Anglo-Italian Review*. The other prominent periodicals include the *Round Table*, a quarterly review of the politics of the British Empire; *Science Progress*; *Journal of the Royal Asiatic Society*, the foremost authority on Orientalia; the *Hibbert Journal*, a quarterly review of religion, theology and philosophy; *The East and the West* (missionary problem); *Economic Journal*; *Modern Language Review*; the *Quest*, embracing a wide range of philosophic psychology; and journals issued by the Geographical, Statistical and numerous other learned societies. The *Edinburgh Review*, like the *Quarterly*, presents the mature reflections of serious thinkers on problems of the day.

France.—As already stated, the periodical originated in France in 1665, but the idea dates back to 1631, when Théophraste Renaudot, doctor, journalist and philanthropist, started the *Gazette de France*, a weekly political and literary review, which lived till 1792. In 1633-42 he published the *Bureau d'adresses*, a series of reports of the scientific conferences held at

his home every Monday. In January 1665, Denis de Sallo, assuming the name of the Sieur de Hédouville, issued at Paris the first number of the *Journal des Savants*, generally regarded as the parent of critical reviews and the first periodical in France if not in the world. J. Doneau de Visé founded in 1672 the second literary periodical in France, the *Mercure Galant*, which gave reviews of poetry and the drama. Its title was changed in 1717 to the *Mercure de France*, and it was conducted with ability by Marmontel and others until 1818. The *Journal du Palais*, a legal periodical, made its appearance in 1672, and the first medical journal, *Nouvelles découvertes dans toutes les parties de la médecine*, was started in 1679. In 1701 a society of Jesuits at Trévoux began the *Memoires pour servir à l'Histoire des Sciences et des Beaux-Arts*, more commonly known as the *Mémoires de Trévoux*. It was characterized by the excellence of its critical judgments and by the zeal with which it combated anti-Jesuitical opinions; it lasted until 1767. The other noteworthy literary journals of France in the 18th century were the *Année Littéraire* of Fréron (1754-91); the *Magasin Encyclopédique*, begun in 1795, the second series of which was called the *Annales Encyclopédiques*, and the third the *Revue Encyclopédique*—it was suspended in 1832, and a last attempt was made to re-establish it by Didot in 1846, but failed. In the 19th century the *Revue Française*, the *Revue de Paris*, the *Revue Indépendante* and many more have appeared and been discontinued. But the *Revue des Deux Mondes*, begun in 1829, and from 1831 issued fortnightly, was marked by an ability which rendered it permanent, and placed it in the front rank of the critical journals of the world. In 1852 appeared the *Revue Germanique*, devoted to German literature; the *Revue des Races Latines* (1857), appropriated to the arts and letters of those nations having a Latin origin; and the *Revue Européenne* (1859). Other important French periodicals include the *Nouvelle Revue*, *Revue Politique et Littéraire*, *Grande Revue*, *Revue de Famille*, *Revue Illustrée*, *L'Illustration*, *Revue des Lettres et des Arts*, *Figaro*, etc. To the admission of poetry and tales into the reviews, and to the publication by almost every newspaper of a literary *feuilleton* or serial, must be ascribed the comparative paucity in France of serials exactly corresponding to the English and American magazines.

Germany.—The first periodicals in the German language were written in the form of dialogues; they were the *Monatsgespräche* (1688-89) and the *Monatliche Unterredungen* (1689-98). Under the title of *Gelehrte Zeitung* almost every large town had at some period of the 18th century its literary journal, such, for instance, as those published at Frankfort (1736-86), Halle (1766-92), Gotha (1774-1804) and others. But of more importance than all these was the *Göttinger Gelehrte Anzeigen*, begun in 1739. In 1766 Nicolai founded the *Allgemeine Deutsche Bibliothek*, which lived over 49 years; the more valuable *Briefe, die neueste Literatur Betreffend*, supported by Lessing, Mendelssohn and others, had an existence of only six years (1759-65). Among the other notable periodicals established in the 18th century and in the beginning of the 19th were the

Allgemeine Literatur-Zeitung (1785-1848); the *Jenaische Allgemeine Literatur-Zeitung* (1804-48); to which the great literary circle of Weimar, of which Goethe was the centre, contributed. The *Leipziger Literatur-Zeitung* (1800), the *Wiener Jahrbücher der Literatur* (1818), *Hermes* (1819), and the *Jahrbücher für Wissenschaftliche Kritik* (1827). The leading critical authorities are the *Heidelberger Jahrbücher der Literatur* (1808), the *Deutsche Vierteljahrsschrift* (1838), modeled upon the English review, and the *Gelehrte Anzeigen*. Of a more popular tone are the *Blätter für Literarische Unterhaltung* (1833), the *Deutsche Museum* (1852), the *Grenzboten* (1841), *Westermanns Monatshefte* (1855), and many more of the magazine kind. The *Illustriertes Familien-Journal* of Leipzig is of the Penny Magazine school, and enjoys a very large circulation. Of more recent date are *Die Gegenwart* (1872), the *Literaturzeitung* (1874), the *Deutsche Rundschau* (1874), *Die Neue Zeit* (1872); *Nord und Süd* (1878), *Die Nation* (1888), *Die Zukunft* (1892) and *Preussische Jahrbücher*.

Holland.—In 1684 appeared the *Mercure Savant* at Amsterdam, and in the same year the *Nouvelles de la Republique des Lettres*, which was continued with great success until 1718. Then came the *Boekzal van Europa* (1692-1708), which was excelled by the *Republik der Geleerden* (1710). J. van Effen produced his *Hollandsche Spectator* (1731) with marked success; but a new era in criticism was introduced in 1761 by the *Vaderlandsche Letteroefningen*. The *Allgemeene Konsten Letterbode* (1788) maintained for many years a high rank. The *Recensent* (1803), superseded by the *Nieuwe Recensent*, proved itself a powerful rival to the *Letteroefningen*. Other periodicals are the *Nederlandsche Museum* (1835), the *Tijdstrom* (1859) and the *Navorscher*.

India.—The best known of early periodicals in India were the *Calcutta Monthly Register* (1798); the *Oriental Magazine and Indian Hurkaru*, which began at Madras in 1819; the *Madras Miscellany*; the *Calcutta Review* (1844), a valuable existing quarterly; and the *Bombay Quarterly Review*, which dated from 1855. At Singapore the *Journal of the Indian Archipelago* began in 1847, while the *Chinese Repository*, begun by Morrison at Canton, was from 1832 to 1851 filled with valuable articles relating chiefly to literature and history. The *New China Review* (Hongkong 1919) is a successor to the long defunct *China Review*. To-day India has the *Calcutta Review* (quarterly) and the monthlies, the *National Magazine*, the *Indian Magazine and Review* and *Allahabad Review*.

Ireland.—The *Literary Journal* was published in Dublin in 1744, the first periodical in Ireland. In 1836 the *Dublin Review* was established by O'Connell and his friends as the organ of the Roman Catholic party. The *New Ireland Review* appeared in 1894. *Studies* is a quarterly review of letters, philosophy, science and Irish questions. The *Irish Monthly* is a religious publication of considerable literary merit. The *Leader* (weekly) is perhaps the most spirited publication of the new Ireland. An *Claidheamh Soluis* (The Sword of Light) is the official organ of the Gaelic League.

There are many lesser periodicals in Cork and Dublin.

Italy.—In 1668 the *Giornale de letterati* was commenced at Rome by Nazzari, and published until 1679. Under the same title literary periodicals were afterward issued at Parma (1686), at Venice (1719), at Florence (1742), and finally at Pisa in 1771. The *Biblioteca volante* (1676) was of a less solid character, but the *Novelle letterarie*, published for several years subsequent to 1740, was marked by much erudition. Distinguished at a later period were the *Biblioteca Italiana* (1816) of Milan; the *Antologia* (1821) of Florence; the *Giornale Arcadico* (1819) of Rome; the *Giornale Enciclopedico* (1806) of Naples, which was followed in that city by the *Progresso delle Scienze* (1833), the *Museo di Scienze e Letteratura*, and several minor ones, like the *Poligrafo* (1811), *Magazzino Pittoreresco*, and the popular *Album* (1824) of Rome. The chief critical serials are the *Rivista Contemporanea* (1852) of Turin; the *Politecnico* (1839) of Milan, which was suppressed in 1844, and revived in 1859; the *Giornale degli Eruditi* (1883); the *Nuova Rivista Internazionale* (1879) and the *Rivista Internazionale* (1883).

Russia.—In point of size the Russian periodicals excel all others. Among the early publications were the *Yezhemyesyatchniia Sotchneniia* (Monthly Works), edited by Müller from 1755 to 1764. Soon afterward commenced Sumarakoff's *Industrious Bee* (1759) and Keraskoff's *Leisure Hours* (1762). Superior to these, however, was the *Vyestnik Yevrope* (European Messenger), founded in 1802 by Karamzin the historian and subsequently (1808) edited by the poet Zhukovsky. This was followed by the *Russkoi Vyestnik* (Russian Messenger), conducted 1808-20 by Glinka, Gretch and Polevoy; after having been suspended for some years it was revived 1856 in Moscow by Katkov. One of the ablest publications was the *Synn Otchestva* (Son of the Fatherland), founded in 1812, with which was united in 1825 the *Sévernii Arkhiv* (1822) or *Northern Archives*. This combined publication came to an end in 1840; the newspaper *Synn Otchestva* of Petrograd is of more recent origin. Other periodicals past and present include the *Biblioteka dlya Chteniia* (1834) or *Circulating Library*; the *Moscow Russkaya Mysl* (Russian Thought); *Zhurnal Ministerstva Narodnava Prosveshchéniiya*, a monthly *Journal of Public Instruction*; *Vyestnik Vospitaniia* (Educational Messenger); *Mir Iskustva* (Art World); *Russkoye Bogatstvo* (Russian Wealth), a literary monthly; *Mir Bozhi* (God's World); *Russki Arkhiv*; *Russkaya Starina* (Russian Antiquity), an archaeological review; *Baltische Monatsschrift* (Baltic Monthly) in the German language, and the historical journal, *Istoricheski Vyestnik*. The former Russian Imperial Historical Society issued a periodical or *Zbornik* (magazine).

Scotland.—The long defunct *Scots Magazine* first appeared in 1739, and in 1755 there was started in the capital an *Edinburgh Review* which lived only a year, its second number being also the last. Since then there had been no critical journal in Scotland at all till the appearance, on 10 Oct. 1802, of the well-known *Edinburgh Review or Critical Journal* (q.v.)—

"to be continued quarterly." It is now published by Longmans in London. William Blackwood founded the famous *Blackwood's Edinburgh Magazine* in 1817, which soon took rank as the first serial of the kind in the United Kingdom. Among its contributors were Prof. John Wilson ("Christopher North"), James Hogg, Lockhart, Wordsworth, Coleridge, Lamb, Maginn, De Quincy, Landor and other prominent literary masters while in later years Professor Aytoun, Jerrold, Lord Lytton, George Eliot, etc., have enriched its pages. In 1830 came *Fraser's Magazine* which, after many vicissitudes under numerous editors, is now extinct, while *Blackwood's* still flourishes. It was in *Fraser's* that Carlyle's 'Sartor Resartus' was first published (1833-34).

Spain and Portugal.—The earliest periodicals in Spain were the *Diario de los Literatos* (1737), the *Pensador* (1762), the *Seminario Erudito* (1755), the *Memorial Literario* (1784-1807) and the *Variedades*, which acquired a considerable reputation. The *Cronica Científica y Literaria* (1834) subsequently became a political sheet. The *Censor* (1820) was for some years the best Spanish periodical; it was finally superseded by the *Revista Española* (1831), which successively changed its title to *Revista Europea* and *Revista de Madrid*. It was not till after the revolt against Espartero (1841-43) that periodical literature began to flourish in Spain. For a time there existed a journal devoted to bull-fighting. Later came the *Cartas Españolas*, *Antología Española* (1848), the *Revista de España*, the *Seminario Pintoresco* and the *Revista de Ambos Mundos*. The *Journal da Coimbra* in the early part of the 19th century was the first and for a long time the only literary organ of which Portugal could boast. In 1837, however, the *Panorama* was founded, and in 1842 the *Revista universal Lisbonense* was established. Other publications of the literary class are the *Journal da sociedade dos amigos das letras* and the *Bibliophilo*.

Sweden.—The *Svenska Argus* (1732) was the earliest notable addition made by Sweden to learned periodical literature. In 1742 Celsius founded the *Tidningar om den lardes Arbeten*; but the first comprehensive critical journal was the *Svenska Mercurius* (1755), the *Phosphorus* (1810), and the *Iduna* (1811). Both wielded a powerful influence in the literary circles of Sweden, and originated two different schools of poetry and criticism. Among other periodicals were *Polyfem* (1810), *Svea* (1818), *Journal for Literaturen* (1809), *Skandia* (1833), *Literatur-Forenings Tidning* (1833), and the *Literaturblad* (1838). The best of a later date are the *Tidskrift for Literatur* and *Nordisk Tidskrift*.

Switzerland.—In Switzerland the *Bibliothèque Britannique* (1796-1815) and its successor, the *Bibliothèque Universelle* (1816), which was published in two parallel series, one scientific and the other literary, were widely circulated both at home and abroad. The *Revue Suisse* has been conducted with much success at Neuchâtel since 1837.

HENRI KLEIN,

Editorial Staff of the Americana.

PERICECI, pē-rī'ō-kī, the term used in Laconia and other ancient Dorian lands to designate the descendants of the ancient inhabitants of those countries. The Periæci were freemen, and strictly speaking not vassals, much less serfs, like the Helots, but they were considered inferior to the Spartans in regard to social rank and political rights. They were only allowed to occupy the inferior lands, and were employed as artisans, merchants and sailors, and had at times a minor share in the government. At some periods they were allowed to intermarry with the Dorians, and they served in war even as hoplites, though they were compelled to form corps of their own, not being allowed to serve in the same corps with the Dorians.

PERIOPTHALMUS. See MUD-SKIPPER.

PERIOSTEUM, the fibrous membrane investing the bones, and serving as a medium for the transmission of the nutritive blood vessels of the bone. It firmly adheres to the surface of bones, save at their gristly or cartilaginous extremities, and it becomes continuous with the tendons or ligaments inserted into bones. In young bones the periosteum is loosely

attached to the shaft, and between the growing bone and the periosteum a layer of soft blastema or formative matter is interposed, this layer contributing to the formation of new bone on the outer surface of the structure. As the bone advances in development, and in adult life, the periosteum grows much thinner, and it becomes in time more or less firmly adherent to the bone. When the periosteum, through disease or injury, becomes affected, the blood-supply and nutrition of the bone suffer, and in consequence the bone-tissue dies or becomes necrosed, and is exfoliated or thrown off in the form of a sequestrum. The alveoli or sockets of the teeth are lined by periosteum, and this membrane is reflected on to the tooth, and invests it as far as the neck. The periosteum at the neck of the tooth merges with the fibrous structures of the gums. When a bone is fractured the periosteum plays an important part in the repair of the injury, new osseous material being deposited by the membrane. It is liable to certain diseases, such as actinomycosis, tumor, tuberculosis, etc. See PERIOSTITIS.

PERIOSTITIS, pēr-ī'ōs-tī'z, inflammation of the membrane encasing a living bone, or the periosteum (q.v.), a painful ailment frequently developed by sudden exposure to cold after being heated. It is exhibited in two forms, acute and chronic. In the acute form suppuration commonly occurs, with the result of separating the membrane from the bone structure, in which case it is liable to suffer necrosis. This condition calls for prompt removal of the pus. Various constitutional diseases, such as scrofula, syphilis, tuberculosis or gout, may produce chronic periostitis. The chronic form usually excites a thickening of the bone at the point beneath the affected membrane. The diagnosis that detects the originating disease will also lead to the indicated treatment, which is to be applied chiefly to that cause of the periostitis.

PERIPATETIC PHILOSOPHY, the philosophy of Aristotle, which received this name from the shady avenues (Greek *peripatoi*) in which that philosopher was accustomed to walk with his disciples, while expounding to them his doctrines. See ARISTOTELIANISM.

PERIPATUS, a genus of animal, somewhat resembling the cylindrical myriapods, first described as mollusks, then transferred to the annelids, and now regarded as arthropods, since Moseley discovered that they respired by tracheæ, resembling those of the insects. The animals have a wide but discontinuous distribution, being found in South and Central America, the West Indies, Cape of Good Hope, the Kongo, Australia, New Zealand, Melanesia and Malaya, living in decaying wood and feeding upon the insects found there. This distribution is indicative of great antiquity, but we cannot hope to find fossils of the group since all hard parts are lacking. The animals have cylindrical, worm-like bodies, without external segmentation, supported on numerous fleshy feet, the number varying with the species. The head has a pair of primitive eyes, a pair of ringed antennæ and a pair of jaws, while on either side of the mouth are the openings of a pair of slime-glands, the secretion of which is exceedingly sticky. The nervous system is very primitive. The respiratory organs, as mentioned

above, are air-tubes or tracheæ which, unbranched, arise in scattered bunches from the skin. The excretory system is much like that of the annelids and consists of a pair of *nephridia* in each segment. The sexes are separate; the reproductive organs opening below just in front of the terminal anus. The young are born alive. The different species show great differences in their development. There is great uncertainty as to the position of these forms, which are usually regarded as a class variously called *Malacopoda*, *Onychophora* or *Protracheata*. By some they are regarded as the stock from which the insects have sprung, by others the resemblances between the *Malacopoda* and *Insecta* are regarded as homoplastic. The distinctly arthropod features of *Peripatus* are limbs modified as jaws, openings from the heart into the pericardium, the absence of a true body-cavity around the viscera and blood-sinuses surrounding the viscera. The nephridia and the presence of cilia in the generative organs are annelid characteristics. Other features in which *Peripatus* is unique among arthropods are the distribution of the tracheæ, the absence of a second pair of jaws, the reproductive system, the texture of the skin and the similarity of the body-segments behind the head. The original genus *Peripatus* has recently been divided by some authorities into several genera. Consult Sedgwick, A., article on *Peripatus* in 'The Cambridge Natural History' (London 1895).

PERISCOPE, a term first applied to spectacles with concavo-convex glasses, constructed to increase the distinctness of objects when viewed obliquely. It now designates an apparatus with reflecting prisms at opposite ends of a tube so that an observer beneath the surface of water or otherwise concealed may make observations. It was much used in the trenches during the European War of 1914-18, but its employment on land was eclipsed by its development and use as the eye of the submarine. Here it was developed into a strong rigid machine enabling the submarine commander to scan the seas round about while retaining his vessel submerged. The magnification in the larger types reached as high as six diameters. See SUBMARINE.

PERISSODACTYLA. See UNGULATA.

PERISTALSIS, vermicular or peristaltic motion or contraction of the stomach and intestines; a kind of undulation or worm-like movement beginning at some point in the wall of a tubular viscus and extending from above downward toward or to the end of the hollow organ. Its object is to propel forward the contents of the viscus. The movement is a series of gentle but strong contractions, associated and alternating more or less with contractions of the longitudinal fibres. Peristalsis in the stomach and intestines pushes the food along so that it can come in contact with the digestive juices, and its waste be cast out of the body. In very thin persons peristalsis of the small intestine is sometimes so conspicuous that the ignorant have inferred the presence of a live snake within the abdomen. Food, after it leaves the grasp of the constrictor muscles of the pharynx, is pushed through the œsophagus or gullet and into the stomach by the peristaltic movements of the œsophagus. Urine and sometimes calculi

are propelled from the kidneys into the bladder by the peristalsis of the walls of the ureters. Sometimes there is an inverse action of the muscular fibres of a hollow viscus, producing anti-peristalsis. Peristalsis is involuntary, and mainly under the control of the ganglionic division of the nervous system, and may continue for a time after death. The presence of irritating substances cause abnormal peristaltic motion, which may then be painful, spasmodic or violent. See DIGESTION.

PERISTEROPODES, a division or sub-order of the *Gallinæ*, including the curassows and mound-builders, distinguished by having the hind toe long and on a level with the others as in pigeons. It is contrasted with *Alectoropodes*, or true fowls, which have the hind toe short and elevated.

PERISTYLE, in architecture, a name given to a range of columns surrounding anything, as the cells of a temple, or any place, as a court or cloister. It is frequently but incorrectly limited in signification to a range of columns round the interior of a place. In the Roman house the peristyle was a room somewhat like the atrium, but larger, containing an open space surrounded by pillars.

PERIT, Pelatiah, American merchant: b. Norwich, Conn., 23 June 1785; d. New Haven, Conn., 8 March 1864. He was graduated from Yale in 1802, taught for a year, entered business in Philadelphia and in 1809 settled in New York where he engaged with a firm of shipping merchants. He was a member of the firm in 1817-63 and in 1853-63 was president of the Chamber of Commerce. In that position he rendered important service to the government by leading in the movement which put the United States treasury on a basis to meet the heavy expenses of the Civil War. In 1857 he served as a police commissioner and did much to restore the security of New York City, which was endangered by the contest between the "Municipal" and the "Metropolitan" police. He was a benefactor of many educational and charitable institutions and was deeply interested in Christian missions.

PERITONEUM, the most extensive serous membrane in the body. It lines the abdominal cavity in mammals, and in general the body-cavity of other vertebrates. In man it forms a closed sac; in the female it communicates with the interior of the uterus through its Fallopian tubes. It partially invests all the viscera in the abdominal and pelvic cavities, forming the visceral layer of the peritoneum; the portion reflected upon the internal surface of the walls of the abdominal and pelvic cavities is the parietal layer. The cavity enclosed by these two layers is the peritoneal cavity, which in health contains just sufficient serous fluid to moisten its surfaces. The free or inner surface of the peritoneum is moist, smooth and glistening and covered by a layer of flattened endothelial cells; its attached or outer surface is rough, being connected to the viscera and the walls of the abdominal and pelvic cavities, by means of the subperitoneal alveolar tissue. Various reflections of the peritoneum, such as the broad folds known as the mesenteries (the mesentery proper, the mesocolon, etc.) and the narrow ones forming ligaments (of the liver,

spleen, bladder and uterus), hold the viscera in position and enclose vessels and nerves, while admitting free movement of certain of the viscera.

The pancreas, kidneys and suprarenal capsules lie behind the peritoneum; the liver, stomach, spleen, a large part of the small and large intestine and the uterus and ovaries are almost entirely invested by it; the remaining viscera are partially invested. Duplicatures of the peritoneum extending from the stomach to adjacent organs are called omenta. The largest peritoneal fold is the great omentum, enfolding the transverse colon and reaching in front of the small intestine as low down as the pelvis, forming a sort of apron. A fold of peritoneum between the rectum and vagina forms a pouch or cul-de-sac known as the rectovaginal pouch. In the male fetus a lengthened pouch of peritoneum accompanies the testicle at the time of its descent, the upper part of the pouch becoming obliterated just before birth; in the female there is a similar pouch, sometimes persistent.

The peritoneum may become inflamed from various causes, constituting the disease known as peritonitis. It may be injured by contusions and wounds of various kinds, or it may be the seat of morbid formations, such as deposits of fat in the great omentum, or of new growths, tuberculous and cancerous. Peritonitis is always serious and in its acute form, especially if extensive and associated with rupture of the intestine or other viscera, frequently proves fatal. An injury to the peritoneum from without may not prove dangerous unless it induces hemorrhage or severe inflammation. But the introduction of foreign material, such as food, fæces, calculi, pus and bile, into the peritoneal cavity by perforation and rupture is a grave complication. Chronic inflammations of the peritoneum and some acute forms sometimes produce false membranes which bind some of the abdominal and pelvic viscera, restraining their necessary movements and inducing chronic and troublesome disorders.

Surgeons formerly did not consider it a legitimate operation to open the abdomen for the removal of diseased organs, etc., so great was the dread of establishing a severe inflammation. At the present time many lives are saved by such operations. With antiseptic precautions, the opening of the peritoneal cavity is now considered a reliable mode of procedure in many cases. Consult 'Reference Handbook of the Medical Sciences' (Vol. VII, New York 1916).

PERITONITIS, inflammation of the peritoneum. It is either acute or chronic. The acute form is always serious and often quickly fatal; the chronic is sometimes of little consequence, sometimes grave, but may end in great improvement or practical recovery. The symptoms and prognosis of this disease depend upon the extent and degree of the inflammation, whether it is general or local, circumscribed and partial, and also upon the cause, predisposing or exciting. The diagnosis, except in typical cases, is sometimes obscure; the disease may be latent, or subacute at the outset and for a considerable period. The principal dangers of the disease are great depreciation of the vital forces, with impairment of the blood in extensive inflammation; shock to the nervous system from perforations; and impairment of the necessary move-

ments of abdominal organs from fibrinous exudations. Perforation is the result of an ulceration and may occur from ulceration of the small intestine in typhoid fever, chronic ulcers of the stomach, ulceration in dysentery and in appendicitis, ulceration of softened solid abdominal organs, of cysts, of aneurismal sacs, of pulmonary abscesses through the diaphragm, etc. Sometimes the localized thickening of the peritoneum resulting from the inflammation of a threatening ulceration prevents a perforation and the already existing peritonitis becomes less dangerous. Urine and unhealthy pus are especially dangerous, if introduced into the peritoneal cavity. Idiopathic or spontaneous peritonitis, resulting from such causes as cold, or excessive eating or drinking, is rare, though it sometimes occurs. Acute peritonitis is more common among women than among men, as the result of extra-uterine pregnancy, or ovaritis, or the extension of gonorrhœal or other forms of inflammation from the uterine cavity, etc. It is usually due either to wounds, perforation from ulceration or severe injury, or to obstruction or irritation, the result of the presence of morbid products. While the peritoneum is frequently cut or aspirated by the surgeon with safety, sometimes a slight penetrating wound, especially if air and septic material accompany it, proves fatal. Violent blows upon the abdomen may not only excite peritonitis, but may rupture solid or hollow viscera, causing blood and other foreign material to escape into the peritoneal cavity, usually with fatal results. Distention of the peritoneal sac in ascites, morbid deposits, such as cancer and tubercle, mechanical pressure or friction, extension of a local inflammation of the uterus, liver, etc., or from a pleurisy, a pericarditis or a strangulated hernia, are among the causes of peritonitis. The internal marks or characteristics of acute peritonitis are hyperæmia and infiltration, more or less marked, of the peritoneum; sometimes small extravasations of blood; serous effusion containing flakes of fibrin; sometimes pus in considerable quantity, especially in the pelvic cavity, occasionally dangerously infectious; and thin layers of soft fibrinous material coating one or more of the viscera; or firm fibrinous exudations. The first symptom usually noticed by the patient is pain in one spot, which pain gradually spreads and becomes intense and is aggravated by movements either of the bowels or the body. The pain may be preceded by shivering. The patient lies for the most part upon the back with the knees drawn up to relieve tension. The abdomen gradually becomes distended with gas and is tympanitic; soreness and tenderness are more or less marked; the pulse reaches to 120 or more and is small; the tongue is very red and is covered in part with fur; thirst and vomiting are not infrequent; bowels are usually constipated, but sometimes there is diarrhœa; there is more or less difficulty in urinating; fever is high; the face wears an anxious expression; and perspiration is sometimes profuse. A chill in the course of the disease indicates either a perforation or other serious complication. In latent acute peritonitis pain may be slight and there may be no tympanites.

While acute peritonitis is a very dangerous disease, especially if perforation occurs, its treatment is now much more successful than it was before 1842, when Alonzo Clark, in the

United States, demonstrated the power of opium to relieve pain and calm nervous and muscular irritability. Absolute rest in bed, hot applications, easily digested food, attention to the tongue, bowels and bladder and quiet surroundings are additional remedies.

Chronic peritonitis may be the result of an acute peritonitis, but in the majority of cases is due to the deposit of tubercular material, mostly in the mesenteric and intestinal mucous glands, of cancerous material in abdominal organs, or to chronic ulcerations of the stomach, to renal disease, etc. The history is obscure; the symptoms are a feeling of tightness or of dragging; a dull pain, aggravated by movement; a poor appetite; more or less diarrhœa and constipation; dryness of the skin and its earthy hue; gradual emaciation, bed-sores, etc. The principal evidence of chronic peritonitis is fibrinous exudation. The prognosis is, as a rule, unfavorable if the inflammatory products are extensive. The disease may last a long time.

Bright's disease, low forms of fever, erysipelas and a tuberculous tendency are predisposing causes of peritonitis. Tuberculous peritonitis is often cured by opening and exposing the tuberculous masses to the air and washing out with a saline solution. Puerperal peritonitis is especially to be dreaded because of the great mortality attendant upon it.

PERITYPHLITIS, inflammation of the connective tissue behind and around the cæcum. The most frequent cause is an extension of inflammation from the cæcum (typhlitis) or the vermiform appendix, but it may result from the extension of inflammation from more distant parts of the body. External injury, such as blows, kicks or severe compression of the lower part of the body, are some of the exciting causes. Prognosis depends upon the severity of the inflammation and the local lesions resulting. If an abscess forms and discharges into the peritoneal cavity, death results. The diagnosis of perityphlitis is more or less difficult. See CÆCUM; COLON; APPENDICITIS.

PERIWINKLE, a genus (*Vinca*) of the family *Apocynaceæ*. The species, of which 10 have been described, are erect or trailing herbs or sub-shrubs with opposite leaves, and rather large axillary, solitary, salver-shaped flowers. Four species are cultivated in gardens and greenhouses. The common periwinkle, running, blue, or trailing myrtle (*V. minor*) is a hardy, evergreen, trailing herb common in shady cemeteries, gardens, etc. It is typically blue-flowered, but some of its varieties have white, others pink flowers. Some have variegated foliage. The larger periwinkle (*V. major*) is larger in stem, leaf, flower, etc., than the preceding species, but is less hardy in the north. Some of its variegated varieties are exceedingly popular for window-boxes, hanging baskets and vases, being able to withstand untoward conditions with respect to heat and drought. The Madagascar, Cape or rose periwinkle (*V. rosea*), is a tender, ever-blooming species cultivated in greenhouses. It is also popularly called old maid. The herbaceous periwinkle (*V. herbacea*) is a hardy species which sheds its leaves in winter. The flowering shoots which appear in spring are followed by leafy stems that root at the tips. It is valued for its free-flowering qualities. All these

species are readily propagated from cuttings or seeds and will thrive in almost any kind of soil.

PERJURY, *in law*, is an offense defined as intentionally false testimony given under oath on a point material to the question by one required by law to state the truth in any judicial proceedings. In a number of jurisdictions statutes are in effect which provide that sworn testimony or declarations in other specified conditions shall be considered perjury. Whether or not one testifies voluntarily or under compulsion does not affect the status of perjury. Under a Federal statute one is guilty of perjury who falsely states, certifies to or declares before a tribunal, or a person authorized under a law of the United States, relative to any material matter which he does not believe to be true. Generally perjury is a misdemeanor and punishable as such, but in some States it has been made a felony; the offense takes place immediately upon completing the false testimony before a court, person or officer, lawfully authorized to take same; and one is not liable for perjury where an oath is not required by law, or upon a false statement made under mistake, or unusual circumstances such as excitement, or fear, or without knowledge of the falsity of the statement. Whether injury results from the false oath, or the same is credited or not, is not material to the offense. Perjury must be proven beyond all reasonable doubt and cannot be established by the proof of a single witness. The punishment therefor must be only as provided by law, and is usually prescribed by statute. Damages cannot be recovered in a civil action on account of the commission of perjury, or procuring another to commit perjury. A person procuring another to commit perjury is guilty, if the perjury is actually committed, of subornation of perjury; this may be proven by one witness, and the person so found guilty may be convicted. If one attempts to procure another to commit perjury, but perjury is not actually committed, he is guilty of incitement to commit perjury and may, under some statutes, be indicted and punished.

PERKASIE, pēr'kə-sī, Pa., borough of Bucks County, situated on the Philadelphia and Reading and the Lehigh Valley Traction Company railroads, 35 miles north of Philadelphia. It is a thriving industrial centre, with brick-yards, tile works, silk mills, cigar factories, wire, tag and label works, etc. The borough owns and operates the electric-lighting plant. Pop. 3,150.

PERKIN, Sir William Henry, famous English chemist: b. London, 12 March 1838; d. there, 14 July 1907. His title to fame is mainly based on his greatest and earliest achievement, the discovery of the first aniline color, in 1858. Educated at the City of London College, he entered the Royal College of Chemistry in 1853. Two years later he was assistant to Dr. Hofmann in his research laboratory. His aniline discovery was made whilst conducting some experiments at home during the Easter vacations. The object he had in view was the artificial formation of quinine; what he found, however, was the aniline purple or mauve color, which was destined to lay the foundations of the great coal-tar color industry. He made numer-

ous experiments at Pullar's dye works at Perth, and finally left his college to devote himself entirely to the development of his discovery, which he patented when he was 18 years old. With the assistance of his father and his brother he started the firm of Perkin and Sons and erected some works near London, where the new dye was successfully produced in 1857 and supplied to silk dyers and calico printers. He also discovered several other coal-tar coloring matters, and when Liebermann and Graebe discovered the formation of alizarine from anthracene in 1868, Perkin devised two processes to put that discovery to practical uses. He was the first, in 1869, to manufacture alizarine commercially, and also found that with this artificial product another coloring matter was associated, namely, anthra-purpurine, a valuable ingredient in varying the shades of pure alizarine. In 1873 he retired from technical work to continue his researches in pure chemistry, on which branch he published numerous papers, e.g., the artificial formation of glycocine, a derivative of gelatine (1859), and tartaric acid (1861). His first papers on salicylic aldehyde appeared in 1867, in which he proved that his substance was also a phenol, a discovery that led to the artificial formation of coumarin and other odoriferous substances, an event that marked the beginning of the artificial perfume industry. By the process known as "Perkin's Reaction" it became possible to produce cinnamic acid technically for the artificial production of indigo by the method of Bayer. Perkin's valuable services were universally recognized. The jubilee of his aniline discovery was celebrated in 1906, on which occasion he was knighted by King Edward and likewise received honorary degrees from the universities of Oxford, Columbia (N. Y.), Johns Hopkins, Heidelberg, etc. He was presented with the Hofmann medal by the German Chemical Society and the Lavoisier medal by the French Chemical Society. A sum of \$13,500 was subscribed by chemists and handed to the Chemical Society (London) to found a "Perkin Memorial Fund" to be applied to the encouragement of research in the coal-tar and allied industries. The English Society of Dyers and Colourists instituted the "Perkin medal" for distinguished services to chemical industry, and the American memorial committee founded a Perkin medal for American chemists. The three sons of Sir William Perkin followed in their father's footsteps, and each enjoys an international reputation for achievements in the domain of science.

PERKINS, Charles Callahan, American art critic: b. Boston, Mass., 1 March 1823; d. Windsor, Vt., 25 Aug. 1866. He was graduated from Harvard in 1843, studied music and art in Europe and became widely known as an art critic and writer and was one of the first to practise the art of etching in this country. He was elected to the French Legion of Honor in 1867, corresponding member of the French Institute in 1868, was president of the Boston Art Club in 1869-79, one of the founders of the Boston Museum of Fine Arts, and occasionally he conducted the performances of the Handel and Haydn Society of which he was president in 1875-86. He was critical editor of Champlin's 'Cyclopædia of Painters and Paintings' (1886-

87) and wrote 'Tuscan Sculptors' (1864); 'Art in Education' (1870); 'Raphael and Michelangelo' (1878); 'Ghiberti et son Ecole' (1886), etc.

PERKINS, Elisha, American physician: b. Norwich, 16 June 1741; d. 6 Sept. 1799. He began the practice of medicine with his father at Plainfield, Conn. He invented, about 1796, some instruments which he named metallic tractors, for the cure of local pains, inflammations and rheumatism. The tractors, he claimed, were of peculiar and secret composition, but it is asserted that one was of iron, the other brass; they were three inches long and pointed. In use they were drawn downward over the affected part of the patient for 20 minutes. The wonder is that many learned men in the United States and abroad approved the process. It was known as "Perkinism," and 12 physicians in Copenhagen (probably the ancestors of those who a century later received Dr. Cook!) tested it, and published a volume in its favor, giving details of its effects. Dr. Perkins' son published a book, in London, introducing the method; and there it inspired so much faith that a Perkinian institution was opened, of which Lord Rivers was president. Recommendations were signed by many physicians and clergymen, and thousands of cures published. Heated discussions arose, and a satire, 'Terrible Tractation,' was put forth by Thomas G. Fessenden, in defense of the tractors. The history of this supposed remedy belongs doubtless among the many illustrations of the power of the mental state over the physical. Dr. Perkins invented also an antiseptic, and visited New York in 1799 when he undertook to prove its efficacy during a yellow fever epidemic, but he himself fell a victim to the fever.

PERKINS, George Clement, American senator: b. Kennebunkport, Me., 23 Aug. 1839; d. Oakland, Calif., 26 Feb. 1923. He was reared on a farm; went to sea at 13 and was cabin boy and sailor until 1855 when he shipped on a sailing vessel for San Francisco and on arrival there went to Oroville, where he engaged in mining. Subsequently he carried on a successful mercantile business in San Francisco and became interested in banking, milling, mining and the steamship business. He operated numerous ships on Pacific Ocean from Alaska to Mexico. In 1869-76 he was a member of the California senate and in 1879 to 1883 was governor of California. On 24 July 1893 he was appointed United States senator to fill the vacancy caused by the death of Leland Stanford and on 8 Aug. 1893 was elected for remainder of term. Mr. Perkins was re-elected in 1895, 1903, 1909, but was not a candidate in 1915.

PERKINS, George Walbridge, American financier: b. Chicago, 31 Jan. 1862; d. 18 June 1920. He was educated in the public schools of Chicago; began work in the Chicago office of the New York Life Insurance Company in 1877, becoming successively bookkeeper, cashier, inspector of agencies, superintendent of Western department, third vice-president 1892; in charge of agency force with headquarters in home office and second vice-president in 1898. In 1900 he became chairman of the finance committee of the New York Life and in 1903 was made vice-president. From 1901 to 1910 he was a partner in the banking firm of J. P.

Morgan and Company. He was a director of the International Harvester Company and president of the New York Palisades Interstate Park Commission, and director in several industrial corporations. In 1912 Perkins supported Roosevelt and the Progressive party and in 1915 opposed the return of the Progressives to the Republican fold.

PERKINS, Jacob, American inventor: b. Newburyport, Mass., 9 July 1766; d. London, England, 30 July 1849. He was early apprenticed to a goldsmith and at 15 invented a method of plating shoe-buckles, which he manufactured successfully. At 21 he was engaged in making dies for the copper coinage of Massachusetts, shortly after inventing a machine which cut and headed nails at one operation. He gained no pecuniary advantage from this invention owing to the mismanagement of his partners, but soon afterward originated the idea of substituting steel for copper plates in banknote engraving, thereby greatly lessening the expense of the operation, and later invented a method of transferring the costly engraving from one plate to another by means of pressure. He removed to Philadelphia where he was associated with a firm of banknote engravers and in 1818 went to London and obtained the contract for supplying the Bank of Ireland with plates. Later he became interested in steam artillery and constructed a gun in which steam was used for the propelling power in place of powder. He also invented an instrument for measuring the depth of water, called the bathometer, and the pelometer for measuring the speed at which a ship is moving. Science also owes to him its knowledge of the fact that water is compressible.

PERKINS, Justin, American Congregational clergyman and missionary: b. West Springfield, Mass., 12 March 1805; d. Chicopee, Mass., 31 Dec. 1869. He was graduated from Amherst in 1829 and later studied at the Andover Theological Seminary. In 1833 he was ordained to the ministry and sailed for Persia where he established a mission among the Nestorians. He translated the Bible into modern Syriac and wrote a commentary on Genesis and Daniel, meanwhile aiding in the establishment of missionary schools and directing general missionary work. He wrote 'A Residence of Eight Years in Persia' (1843); 'Missionary Life in Persia' (1861), etc.

PERKINS, Thomas Handasyd, American merchant: b. Boston, Mass., 15 Dec. 1764; d. Brookline, Mass., 11 Jan. 1854. He entered a counting-house in Boston when very young and later joined his brother in mercantile business in Santo Domingo. He returned to the United States and then went to China and East India in order to attain a thorough knowledge of the trade, finally settling in Boston where he amassed a large fortune. In 1805 he was elected to the legislature of Massachusetts where he served for many years. He was deeply interested in philanthropic enterprises, founded the Perkins Institute for the Blind at Boston, contributed generously to various public institutions, among them the Massachusetts General Hospital and the Boston Athenæum. He was a projector of the Quincy Railroad, the first railroad built in the United States.

PERKINS, William Oscar, American composer: b. Stockbridge, Vt., 23 May 1831; d. Boston, Mass., 13 Jan. 1902. He engaged in teaching in Boston, became known as a musical conductor and organized the Mendelssohn Vocal Quartet, believed to be the first male quartet for concert singing organized in the United States. In 1858 he was conductor of the Boston Music Hall, conducted different musical festivals and was a member of the governing board of the Handel and Haydn Society. He lectured and wrote on musical subjects, composed many songs and hymns, and compiled and edited 60 volumes of vocal music. His last composition was 'The War in South Africa, or Boer and Briton' (1900).

PERKS, Sir Robert William, English engineer: b. Kensington, 24 April 1849. He was educated at New Kingwood School, Bath, and at King's College, London. In 1878-92 he was a railway lawyer; was associated with the late T. A. Walker in building the Barry Docks, Preston Docks, the Manchester Ship Canal, the Inner Circle Railway and other works. He also built the Rio de Janeiro quays and harbor works for the Brazilian government, the port extension at Buenos Aires for the Argentine government and the Transandine Railway between Chile and Argentina. He retired from the firm of Walker and Company in 1912 and is now member of the firm of McArthur, Perks and Company, Ltd., of Ottawa and New York. He is interested in the Georgian Bay Canal and sat in Parliament in 1892-1910 as Liberal member for the South division of Lincolnshire. In 1908 he was made a baronet.

PERLES, pēr'lēs, Joseph, Jewish rabbi: b. Baja, South Hungary, 1835; d. 1894. He was educated at Breslau and in 1859 received the degree of doctor there. His doctor's thesis was entitled 'Meletemata Peschitthoniana' and propounded a new theory in regard to the origin of the Peshitto version. Dr. Perles was appointed rabbi at Posen in 1862 and removed to Munich in 1871. His later writings dealt mainly with Hebrew philology and the history of the Jews in the Middle Ages.

PERLEY, Sir George Halsey, Canadian statesman: b. Lebanon, N. H., 12 Sept. 1857. He was educated at Ottawa Grammar School and at Harvard University; entered commercial life in Canada and soon had acquired extensive lumber manufacturing, railroad and banking interests. He was elected to the Dominion House of Commons in 1904; was chief Conservative whip in 1911 and a violent opponent of reciprocity with the United States. When the Borden Cabinet was formed he became minister without portfolio. In 1913 Perley became High Commissioner for Canada in London. He was knighted in 1915.

PERLEY, Moses Henry, Canadian scientist: b. Maugerville, New Brunswick, 1804; d. 1862. He received his education at Saint John and in 1830 became a member of the bar but did not practise. He acquired large lumbering and manufacturing interests and becoming interested in exploration soon became an expert on the physical resources of the Canadian provinces. In 1840 Mr. Perley was made Indian commissioner and emigration agent for the province of New Brunswick. During the years

1848-51 Perley made exhaustive reports on the fisheries of Canadian eastern waters and in 1854-66 prepared much of the data for the Canadian side in the discussion of a reciprocity treaty with the United States. The Natural History Society of New Brunswick was founded by Mr. Perley who was also a frequent contributor to literary and scientific journals. He published 'Report on the Forest Trees of New Brunswick' (1847); 'Catalogue of Fishes of New Brunswick and Nova Scotia' (1851); 'Observations on the Geology and Physical Characteristics of Newfoundland' (1862).

PERM, pĕrm, Russia, (1) the capital of an eastern government, on the high left bank of the Kama, at the confluence of the Chusovaya, about 250 miles due north of Ufa, with which it is connected by rail via Ekaterinburg and Cheliabinsk. It was founded in 1781, has straight and spacious streets, a well-kept park and a number of handsome public buildings, among them the cathedral and 18 other churches. There are also a gymnasium, a theological seminary, several other educational and scientific institutions and a civil and military hospital. A permanent exhibit of the city's products is maintained in the Zemstvo building. The chief employment is in connection with the iron smelting and refining works. There is a considerable trade with the inland districts, and an increasing river traffic. The great highway connecting Moscow with Siberia passes by way of Perm. Pop. 105,410. (2) A government of eastern Russia, politically attached to European Russia, but topographically Asiatic and almost enclosed by the Ural Mountains. Area, 127,500 square miles. While lumbering, agriculture and stock raising are considerable industries, Perm's commercial importance is due to its vast mineral wealth, consisting of iron, coal, salt, zinc, copper, nickel, platinum, silver and gold. Pop. 4,083,200. See RUSSIA.

PERMANENT WAY, a term used in Great Britain to designate the finished roadbed and track of a railway, including bridges, viaducts, crossings and switches. The term is used in contradistinction to a temporary way, such, as is made in construction, for removing the soil and making fillings.

PERMANENT WHITE, a white pigment consisting of sulphate of barium precipitated from the chloride by adding dilute sulphuric acid. It is used as an adulterant of, and as a substitute for, white-lead.

PERMANGANATE. See MANGANESE.

PERMIAN, in geology, the name given to the last of the smallest time divisions of the Palæozoic, which are of worldwide recognition. The rocks of this age were first studied by Murchison, Dr. Verneuil and Keyserling, in the Russian province of Perm, whence the name. In Germany they are also known by the term "Dyas," proposed by Geinitz on account of their well-marked division into two groups—the Rothliegende and Zeckstein. In Europe these rocks overlie the Carbonic for the most part unconformably, but in North America there is no sharp line of demarkation between them. This has led to a difference in grouping of the time division in question, and the formations belonging to it. English and Continental geologists consider the Permian a distinct division, equiv-

alent to Siluric, Devonian or Carbonic (Carboniferous), while in America it was formerly made the terminal subdivision of the Carbonic era. The present textbooks, however, conform generally to the European mode of classification. Its best development in this country is in the Middle West. According to the latest studies of Puner, the Permian of Kansas consists of a lower marine series—"Big Blue series," and an upper non-marine series, "Cimarron series." In Pennsylvania, Ohio and West Virginia the deposits of this age are known as the Upper Barren Measures or Dunkard Creek series. They are non-marine beds of sandstones, shales and calcareous layers, with some thin seams of coal. The greatest thickness is not much over 1,000 feet. Palæontologically the Permian deposits are especially interesting from the presence of amphibians and of primitive reptiles. See CARBONIFEROUS.

PERMUTATIONS. See COMBINATIONS.

PERNAMBUCO, pĕr-nām-boo'kō (Port. pĕr-nān-boo'koo), a maritime state of Brazil and its capital city. (1) The state of Pernambuco is bounded on the north by the states of Parahyba, Rio Grande do Norte and Ceará, on the east by the Atlantic, on the south by Alagoas and Bahia and on the west by Piahy; lies between 7° and 10° 40' S. and between 34° 45' and 42° 10' W.; has an area of 49,573 square miles, with a coast line of about 140 miles. Next the sea there is a low coastal plain reaching 30 or 40 miles inland, and back of that the Matta or fertile forest belt and farther inland the treeless plateaus and mountains. The Sierra dois Irmaos on the western frontier is the watershed of the Paranyba and São Francisco, and into the latter river the inland waters of Pernambuco flow. The São Francisco (q.v.) is navigable for nearly its whole extent. The climate varies greatly in the two diverse zones, being moist in the Matta, which follows the sea coast, whereas the Sertão, or "desert" up-country, is dry, arid and almost uninhabited. The alluvial plain grows sugarcane, cotton, tobacco, vanilla, cacao, coffee, redwood, cocoanuts and, among many important drugs, ipecacuanha. There is a little gold and a great deal of excellent marble. Little development of the mineral wealth of Pernambuco has been attempted, but it is known that coal, iron, manganese, Chile nitrate and a superior grade of kaolin have been found in paying quantities. Cattle raising flourishes in the interior, and dairying is increasingly important. Rum and hides rank next to cotton and sugar as the most valuable staples. Pernambuco is the chief sugar and cotton state of Brazil. Its annual yield of cotton is valued at \$5,000,000, and its 60 sugar mills turn out 180,000 tons of sugar per year. Along with the latter industry is the distillation of rum as a by-product. Recife or Pernambuco (see below) is the most important port; there are good harbors at Tamandaré, Porto de Galinhas and Porto do Rio Formosa. The principal cities are Victoria (30,000); Goyana (28,000); Garanhuns (25,000); Cabo (25,000); Escada (22,000); Limoeiro (20,000); and Rio Formoso (20,000). They are all connected with the capital by rail. There are 560 miles of railroad in the state. Its annual exports amount to nearly \$15,500,000; the imports to about \$13,700,000. Pop. (1912)

1,650,000. The region was first settled at Iguarassu and Olinda by the Portuguese in 1534. The Dutch held it 1630-54, and founded Moritzstadt, now the capital. The island of Fernando de Noronha, in lat. 30° 50' S. and 34° 47' west of Rio de Janeiro, belongs to Pernambuco, and so does the island of Itamaraca lying along the coast 18 miles from the city of Recife. (2) The city of Pernambuco, called by the Brazilians Cidade do Recife, that is, Reef City, the third city of the republic, excelled in population and wealth only by Rio de Janeiro and Bahia. It is an Atlantic port, distant, 3,982 marine miles from New York and 4,065 from Liverpool. The city is cut into three parts by the Rio Capiberibe and the Rio Beberibe, Recife occupying the northeast part parallel to the coast reef, and São Antonio being an island southwest of it and southeast of the mainland, on which is the third section, Boa Vista. Two bridges join Recife and São Antonio, and three connect São Antonio and Boa Vista. Recife is the old city, is poorly built and contains the great business houses. São Antonio has the theatres, government buildings, customs house and Parliament; is well built; and has many traces of Dutch occupation. Boa Vista is largely residential with tropical one-story houses and beautiful gardens; it contains the archi-episcopal palace. The harbor is protected from the sea by a long reef, and to this has been added at a cost of \$28,000,000 a breakwater and a stone jetty; with docks affording 28 feet to 33 feet of water, and equipped with electric cranes and capacious storage houses, and plans are on foot to improve the port by excavation. The city is now a regular port for 10 steamship lines, and some 900 steamers aggregating 1,700,000 tons enter and clear annually. The annual imports amount to about \$15,000,000 and the exports to \$5,000,000. The imports are mainly foodstuffs—codfish, flour and dried beef—and manufactures of cotton and of iron and steel. The principal exports are sugar, cotton, carnauba wax and goat skins. Four railroads connect the city with various parts of the state. There are cotton factories, oil mills, machine shops, ship-yards, cigar manufactories, sugar refineries and manufactures of glassware and shoes. Pop. 268,000.

PERNAMBUCO WOOD. See BRAZIL WOOD.

PERNICIOUS ANÆMIA (also called PROGRESSIVE PERNICIOUS ANÆMIA, MALIGNANT ANÆMIA, IDIOPATHIC ANÆMIA, ESSENTIAL ANÆMIA, etc.), a severe blood-disease, a progressive and usually fatal form of anæmia. It was first described in 1855, by Addison, as an idiopathic or self-originated anæmia, hence the term idiopathic or Addison's anæmia. In 1868 it was more closely studied by Biermer, especially as to the post-mortem appearances; and when these are distinctive the disease is sometimes spoken of as Biermer's anæmia. The disease is characterized by a great destruction of the red corpuscles of the blood and lesions of the blood-making organs. The red corpuscles are mixed with megalocytes microcytes and poikilocytes. There is no increase of leucocytes. Post-mortem examination shows that the skin is pale lemon-colored; fat is yellowish pale; there is little loss of subcutaneous fat, but fatty degeneration of organs is common;

heart-muscles are light-colored, flabby and fatty; other muscles may be red; the cavities of the heart contain a little light-colored blood. There is fatty degeneration in the liver, kidneys, gastric and intestinal walls; extravasation of blood in the retinae, serous and mucous membranes and skin; swelling and redness of lymphatic glands; and commonly sclerosis of the posterior and to some extent of the lateral columns of the spinal cord. Deposits of iron, probably due to the great destruction of the red corpuscles, are found in the liver, spleen, pancreas, kidneys, etc. The bone-marrow is frequently very red.

The etiology is obscure. There is undoubtedly hæmolytic or disintegration and degeneration of the blood. This may be caused by long-continued loss of blood, by splenic, miasmatic, glandular, strumous or malignant disease, by intestinal parasites, etc. Bad hygienic conditions, especially impure air and poor and insufficient food, are predisposing causes. The disease most often appears in middle life, and is sometimes almost endemic. The symptoms, which develop slowly, are pallor, shortness of breath, palpitation, muscular weakness, œdema about the ankles, colorless lips and gums, gastro-intestinal disturbance—diarrhoea, dyspepsia, nausea and vomiting or constipation, with loss of appetite—aneurosis, dark urine of low specific gravity, slight fever, though at night the temperature may be 102° F., rapid pulse (100 to 120), soft or full, and sometimes ecchymoses. Death usually occurs in from two months to a year. The treatment is only palliative—rest in bed, nourishing and easily digested food, gentle massage, etc. Transfusion of milk and blood seems to be of little avail. See BLOOD, DISEASES OF THE.

PEROVSKITE. A mineral consisting of calcium titanite (CaTiO_3). Occurs in ore in Gunnison County, Colo.

PEROSI, pā-rō'zē, **Don Lorenzo**, Italian composer: b. Tortona, Piedmont, Italy, 20 Dec. 1872. He was educated at the Milan Conservatory, studied for the priesthood and was ordained at 23. His compositions are exclusively confined to religious subjects in a style appealing peculiarly to the Italian people, crowding the churches with devout listeners. They have thus gained for him much fame throughout Italy, though they are less acceptable to English and German critics on the score of artistic form. He was appointed honorary maestro of the Papal Choir in 1898. He has composed many masses and among his other compositions are the oratorios, 'La passione de Cristo' (1897); 'La risurrezione di Lazara' (1898); 'Il natale del Redentore' (1899), etc.

PEROWNE, pē-rown', **John James Stewart**, English Anglican prelate, the son of a missionary: b. Burdwan, Bengal, 13 March 1823; d. 6 Nov. 1904. He was educated at Norwich Grammar School and Corpus Christi College, Cambridge, ordained in 1847 and appointed curate at Tunsted the same year. He was assistant master in King Edward's School, Birmingham, in 1849, for a time a lecturer in divinity at King's College, London, and from 1862 to 1872 vice-principal of Saint David's College, Lampeter. As an authority on Old Hebrew he was one of the Old Testament Revision Committee (1870-84), and in 1875-78 was Hulsean

professor of divinity at Cambridge. From 1878 till 1891 he was dean of Peterborough and in the last-named year was consecrated bishop of Worcester. He resigned his see in 1901 and was succeeded by Charles Gore (q.v.). His published works include 'The Book of Psalms,' a new translation, with commentary (1864); 'Immortality,' Hulsean lectures (1868); 'Sermons' (1873); 'Life and Remains of Bishop Thirlwall' (1878); 'The Church, the Ministry, and the Sacraments'; and an Arabic grammar. He edited the 'Cambridge Bible for Schools' and the 'Cambridge Greek Testament' for schools.

PEROXIDES, binary compounds of oxygen containing the greatest amount of that element; thus of the two oxides of hydrogen, H_2O and H_2O_2 , the latter is the peroxide; of the two oxides of sulphur, SO_2 and SO_3 , SO_3 is the peroxide; and so on. Some of the metallic peroxides, such as those of barium and lead, appear to be salts of hydrogen peroxide. See HYDROGEN.

PERPENDICULAR, in geometry, a line falling directly on another line so as to make equal angles on each side; called also a *normal line*. Two perpendicular lines form a right angle with one another. As the angle of two intersecting curves is defined to be that of the tangents at the point of intersection, it is possible to define perpendicularity or normality between curves. A plane is perpendicular to another plane if a line drawn on one of them, perpendicular to the line of intersection, is at right angles to a line on the other plane perpendicular to the line of intersection. A line is perpendicular to a plane if it is perpendicular to two distinct lines in the plane through its foot. Two non-intersecting lines may be said to be perpendicular if one lies in a plane perpendicular to the other.

PERPENDICULAR STYLE, a variety of pointed or Gothic architecture, the latest to be introduced. It was first noticed in Gloucester in 1337 but did not acquire distinction until 1370. From that time on it prevailed in England until the middle of the 16th century, the period during which the Flamboyant Style prevailed in France, and is to be regarded as a reaction from the too profuse exuberance of flowing curves in the French practice. It is characterized chiefly by the predominance of upright straight lines in its tracery. The mullions of the windows are vertical, rising generally to the main arches, and are often crossed by horizontal bars or transoms. The mechanical simplicity of this kind of tracery enabled the architects of the period to increase the size of the windows without difficulty or danger, and large windows are accordingly another distinctive feature of this style. The roof of such buildings is often their most striking feature, being either vaulted or supported by open timber work. Another characteristic of the perpendicular style is its extensive use of paneling, suggested obviously by the intersections of the vertical and horizontal construction lines. Nearly all the colleges of Oxford and Cambridge are in this style, and it is also exemplified more or less in many of the English cathedrals, notably York and Canterbury, and in several of the principal churches. The example usually cited as perhaps the most exquisite is

Saint Michael's Church at Wrexham in Coventry.

PERPETUAL MOTION, literally, a device or mechanism capable of maintaining its own state of internal motion forever, without depending upon a supply of energy from external sources. In this sense, the heavenly bodies constitute a system which approximates very closely to perpetual motion, since their movements would probably continue forever if it were not for the dissipation of energy due to their slight tidal influences upon one another, and to the possible existence of some unrecognized resisting medium in space. The phrase "perpetual motion" is not commonly used in this sense, however; for a "perpetual motion" is technically and almost universally understood to be a device or apparatus which is capable of performing an indefinite quantity of mechanical work, without absorbing an equivalent quantity of energy from external sources. (See **ENERGY**; **MECHANICS**). The search for a device of this sort was begun many centuries ago, and although educated physicists have now pronounced perpetual motion (in the more limited technical sense) to be impossible, there are still many persons who are hopefully engaged in the search for it. When the fundamental principles of mechanics were unknown, and it was believed (for example) that heavy bodies, even in a vacuum, fall faster than light ones, there was nothing unreasonable in the hope that a machine might be devised which should furnish energy enough, not only to keep itself going forever, but also to run other machines, and thus do useful work. Further study of the behavior of bodies and forces led to the discovery of certain laws of motion which clearly indicated the impossibility of solving the problem of perpetual motion by any combination of cranks and levers and gears, or by any arrangement of water wheels and pumps, or other simple mechanical devices. It is true that these laws of motion are based upon experimental evidence, and hence their truth may be legitimately questioned; but it must be remembered that all of the great advances in applied mechanics have been based upon the assumption that they rigorously exact, and it is suggestive to note that whenever a machine is constructed so that it demonstrably violates one of these laws, it does not work. Many of those who still persevere in the search for perpetual motion are ignorant of the laws of mechanics, or fail to appreciate the vastness of the experimental evidence upon which they are based. Others take refuge in the more recondite forces of nature. Driven from the field of simple mechanics, they seek, in the less explored fields of physics and chemistry, for principles that may conceivably accomplish what they perceive it is hopeless to search for in better explored regions. Electrical and magnetic devices, in particular, have been exploited in great numbers, and a favorite object of search is some sort of a shield which will be impermeable to magnetism. As time has gone on, and the investigation has been prosecuted in every imaginable field, it has become increasingly evident that the problem of perpetual motion has no solution. It will still appeal to many minds as a logical possibility; but thoughtful men, who are educated in physics and mechanics, have

come to the conclusion, almost without exception, that there is something about perpetual motion which is incompatible with the general principles that underlie the universe as it is actually constituted. It is certainly safe to say that perpetual motion can never be attained by the hap-hazard methods that its seekers have usually adopted. If attained at all, it must be by mastering all the known principles of physics and mechanics that now indicate its impossibility, and then analyzing these and discovering some flaw in the vast mass of experimental evidence upon which they are based. (See **ENERGY**; **ENDLESS SCREW**.) Consult De Morgan, A., 'A Budget of Paradoxes' (London 1872); Balfour Stewart, 'The Conservation of Energy' (New York 1874); Papin, Denis, 'Philosophical Transactions' (1895); Dircks, Henry, 'Perpetuum Mobile' (2 vols., 1861 and 1870).

PERPETUITY, "Any limitation tending to take property out of commerce for a longer period than a life or lives in being, and 21 years beyond, and in case of a posthumous child, a few months more, allowing for the term of gestation" (Randall on Perpetuities, p. 48). A perpetuity need not be strictly for an unending period. Perpetuities in both real and personal estates are forbidden by the common law of England, and accumulations are restricted to a period still more brief than a life and 21 years. In most of the United States this prohibition of perpetuities is enforced unchanged or with slight modifications by the constitution of the State or by statute. New York and some other States have limited the permissible number of the "lives in being" in the definition of a perpetuity to two, and have eliminated the extra period of 21 years. See **ENTAIL**.

PERPIGNAN, pĕr-pĕn-yōn, France, capital city of the department of Pyrénées Orientales, on the right bank of the Têt, seven miles from where that river empties into the Mediterranean. It was united to France in 1659. It is a fortified city of the first class, with walls dating back to the days of Charles V. The city itself is supposed to have been founded as early as the 10th century; a charter was granted it by Peter II of Aragon in 1197; and in 1408 the Council of Perpignan met here at the summons of the Antipope Benedict XIII and attempted to bring the great schism to an end. The university founded in 1349 by Peter IV of Aragon, the cathedral of Saint John, begun in 1324, and Le Castillet, a château in the Moorish style, built in 1319 and now a military prison, are among the interesting public edifices. The present city is a garrison town, and manufactures woolens, silks, playing cards, cigarette paper, chocolate, leather goods and corks, besides trading in wines, olive oil, honey and many Mediterranean products. Pop. about 33,000, and with the rest of the arrondissement of Perpignan about 40,000.

PERRAULT, pār'rō, Charles, French poet: b. Paris, 12 Jan. 1628; d. there, 16 May 1703. He was a man of erudition, but of little taste, whose verses have not outlived his day. Colbert availed himself of his assistance and made him comptroller-general of the king's buildings. Colbert's influence also procured him an election to the Academy. His mediocre

poem, 'Le Siècle de Louis le Grand,' which he read before the Academy in 1687, gave rise to the famous controversy on the comparative merits of the ancients and moderns. In his 'Parallèle des Anciens et Modernes' (1688-91), in the form of a dialogue, he maintains that the moderns have carried art and science, which were in a state of infancy among the ancients, to the highest perfection, and have excelled them in their works. This opinion was answered by Boileau in the 'Reflections on Longinus.' Perrault was also author of 'Les hommes illustres qui ont paru en France pendant ce siècle' (1696-1701). His 'Contes de ma Mere l'Oye' (1897) ('Tales of Mother Goose') have procured for him the title of 'inventor of the French Fairy Tales,' and have secured for him a more enduring reputation than any of his other works. See FAIRY TALES.

PERRAULT, Claude, French architect: b. Paris, 1613; d. 1688. At first a doctor of medicine he soon abandoned this field and took up architecture in which he soon became prominent. His chief works are the eastern façade of the Louvre quadrangle, also the southern, the Paris Observatory, and a triumphal arch at the gate of Saint-Antoine; the last-named work was demolished in 1716. Perrault's works include 'Dix livres d'architecture de Vitruve, corrigés et traduits norwellement en Français' (1673); 'Ordonnance des cinq espèces de colonnes selon la méthode des anciens' (1683; translated into English by John James as 'A Treatise of the Five Orders of Columns in Architecture,' 1708).

PERRET, pâr'râ, Frank Alvord, American volcanologist: b. Hartford, Conn., 2 Aug. 1867. He was educated at the Brooklyn Polytechnic Institute and began as assistant in Edison's East Side Laboratory in 1886. He invented the Perret electric motor and assisted in organizing the Elektron Manufacturing Company of Brooklyn; subsequently was engaged in the manufacture of Perret electric motors at Springfield, Mass. He took up volcanology in 1904 and became honorary assistant to Professor Mattenci in the Royal Observatory, Mount Vesuvius, Italy. He investigated by direct research the Mount Vesuvius eruption of 1906, Stromboli in 1907, 1912 and 1915, Messina 1908, Teneriffe 1909, Sakurashina 1914 and Ætna in 1910. Mr. Perret was director of the Hawaiian expedition of the Massachusetts Institute of Technology and lived at the crater of Kilanea through the summer of 1911. He is the author of scientific papers in professional journals.

PERRIER, pâr'ryâ', (Jean Octave) Edmond, French zoologist: b. near Tulle, Corrèze, 1844; d. 1 Aug. 1921. Appointed professor at the Lycée d'Agen in 1867, in 1872 became master of conferences at the École Normale de Paris. In 1876 he was appointed to the chair of zoology in the Museum of Natural History, of which he was afterward director. Perrier became a member of the Académie of Sciences in 1892. His works include 'Les colonies animales et la formation des organismes' (1881; 2d ed., 1898); 'Les principaux types des êtres vivants, etc.' (1882); 'La philosophie zoologique avant Darwin' (1884); 'Éléments de zoologie' (1886; 8th ed., 1899); 'Traité de zoologie' (1892-1903); 'La vie des animaux

illustrée' (1903-06); 'La femme dans la nature et l'évolution du sexe féminin' (1908).

PERRIN, pâr'rân, Bernadotte, American educator: b. Goshen, Conn., 15 Sept. 1847. He was graduated from Yale in 1869, studied in the universities of Leipzig, Tübingen and Berlin and in 1881-93 was professor of Greek in Western Reserve University, since when he has occupied that chair at Yale. He has written extensively on Greek and Roman history and has edited many textbooks, among them are 'Cæsar's Civil War' (1882); 'School Odyssey,' 8 vols. and vocab. (1897); 'Plutarch's Greek Lives' (1901); etc. He is associate editor of the 'Twentieth Century Series of Text-Books.'

PERRIN, Ernest L., French-Canadian clergyman and educator: b. province of Quebec, about 1876. He was educated at the Collège de Montreal, the Séminaire de Philosophie and the Grand Séminaire of Montreal and in 1899 was ordained to the priesthood. Subsequently he entered the Order of Saint Sulpice and made postgraduate studies at Issy, near Paris and at Rome. In 1902-06 he was professor of philosophy at the Séminaire de Philosophie, Montreal, and subsequently became professor of church history at the Grand Séminaire, Montreal. His success as professor led to Dr. Perrin's promotion to the rectorship of the Collegio Canadese, Rome, an administrative post of great responsibility and difficulty. His administration was most successful despite the difficulties brought about by the participation of Italy in the Great War. In 1917, Dr. Perrin returned to Canada and was appointed to a chair in the Grand Séminaire, the theological department of Laval University at Montreal. He has been highly successful as a professor and his individual efforts have been largely responsible for a general improvement of the standards of education of the Roman Catholic clergy in Canada and the United States.

PERRONE, pâr-rō'nâ, Giovanni, Italian theologian: b. Chieri, Piedmont, 1794; d. 26 Aug. 1876. He was educated in the University of Turin, where he received the degree of doctor of theology about 1814. In the following year he entered the Society of Jesus and in 1816 was appointed professor of theology at Orvieto, removing in a similar capacity to the Collegium Romanum in 1823. For a short time he was rector of the Jesuit College at Ferrara. During the troubled years of 1848, he took refuge in England but returned to his old college in Rome in 1850 and became its rector in 1853. Perrone was one of the greatest theologians of his time and took a prominent part in the discussions relative to the dogma of the Immaculate Conception and that of Papal Infallibility. He wrote 'Prælectiones Theologicæ' (9 vols., 1835-42; compendium in 2 vols., 47 editions); 'Il protestantismo e la regola di fede' (1853); 'De Domini Nostri Jesu Christi Divinitate' (1870); 'De Romani Pontificis Infallibilitate' (1874).

PERRONET, Vincent, English clergyman: b. London, 1693; d. 1785. He received his education at Christ College, Oxford, entered holy orders and was named curate of Sundridge, Kent. After nine years there he became vicar of Shoreham, where he remained for over 50

years. His interest in the Methodist movement was so active that he was called "the archbishop of Methodism" by Charles Wesley. He was the author of two works in defense of John Locke and of several in defense of Methodism.

PERROT, pâr'rô, Georges, French archaeologist: b. Villeneuve-Saint-Georges, Seine-et-Oise, 1832; d. 1914. He received his education at the Ecole Normale, Paris, and at the French school at Athens. He was member of an archaeological expedition to Asia Minor in 1861 and was appointed to the chair of archaeology at the Sorbonne in 1875. Perrot was made director of the Ecole Normale Supérieure in 1889 and subsequently became permanent secretary of the Academy of Inscriptions. He reconstructed the text of the Monumentum Ancyranum and published 'Exploration archéologique de la Galatie et de la Bithynie' (1862-72); 'Histoire de l'art dans l'antiquité,' with Chipiez (1882-); 'Essai sur le droit public et privé de la république athénienne' (1867); 'Les peintures du Palatin' (1872); 'Mémoires d'archéologie, d'épigraphie et d'histoire' (1875); 'Lettres de Grèce' (1908).

PERRY, Arthur Latham, American political economist: b. Lyme, N. H., 27 Feb. 1830; d. Williamstown, Mass., 9 July 1905. He was graduated from Williams College in 1852 and became professor of history and political economy there in 1853, which position he held till 1891, when he was made professor emeritus. He published 'The Elements of Political Economy' (1865), a work which passed through 20 editions; 'Introduction to Political Economy' (1877); 'Principles of Political Economy' (1891); 'Williamstown and Williams College' (1900).

PERRY, Bliss, American educator and editor: b. Williamstown, Mass., 25 Nov. 1860. He is a son of Arthur L. Perry (q.v.); was graduated from Williams College in 1881 and then studied at the universities of Berlin and Strassburg; received the degrees of L.H.D. from Princeton and Williams, of Litt. D. from Bowdoin and of LL. D. from Lake Forest. He was professor of English at Williams (1886-93); of oratory and æsthetic criticism at Princeton University, 1893-1900; editor, *Atlantic Monthly*, 1899-1900, and professor of English literature at Harvard after 1907. He is a member of the National Institute of Arts and Letters; was the Harvard lecturer at the University of Paris 1909-10. He has edited many selections from literature and a series of 'Little Masterpieces.' Among his books are 'The Broughton House' (1890); 'Salem Kirtredge and Other Stories' (1894); 'The Plated City' (1895); 'The Powers at Play' (1899); 'A Study of Prose Fiction' (1902); 'The Amateur Spirit' (1904); 'Walt Whitman' (1906); 'Whittier' (1907); 'Park Street Papers' (1909). 'The American Mind' (1912); 'Carlyle' (1915).

PERRY, Edward Delavan, university professor: b. Troy, N. Y., 20 Dec. 1854. He graduated from Columbia in 1875; received the degree of Ph.D. from University of Tübingen in 1879 and of LL.D. from Columbia in 1904. He has been connected with Columbia since 1880 as instructor in Greek and Sanskrit (until 1891); professor of Sanskrit (1891-95); professor of

Greek (since 1895); dean of faculty of philosophy (1902-09). Prominent in management of American School of Classical Studies in Athens since 1897.

PERRY, John, British physicist: b. Ulster, Ireland, 14 Feb. 1850; d. 4 Aug. 1920. He was educated at Queen's College, Belfast, was assistant master at Clifton College 1870-74; professor of engineering in Japan 1875-79 and in London Technical College, Finsbury 1881-96. He was professor emeritus of mechanics and mathematics at the Royal College of Science, South Kensington. He published 'The Steam Engine' (1874); 'Practical Mechanics' (1883); 'Spinning Tops' (1890); 'Cantor Lectures, Hydraulics' (1882); 'Calculus' (1897); 'England's Neglect of Science' (1901), etc.

PERRY, Matthew Calbraith, American naval officer: b. Newport, R. I., 10 April 1794; d. New York city, 4 March 1858. He was a brother of Oliver Hazard Perry (q.v.). He entered the navy in 1809, served in the War of 1812 and in 1813 was promoted to the rank of lieutenant. In 1819 he was executive officer of the *Cyane*, which conveyed the first colonists to Liberia, and in 1821 and 1822 was active in protecting commerce from the West Indian pirates. He was then with the Mediterranean squadron for a time; in 1826 was promoted to the rank of commander and in 1832 was again on duty in the Mediterranean in command of the *Concord*. He was next stationed at the Brooklyn Navy Yard (1833-43), and took an important part in the organization of the steam naval service. The *Fulton*, the first steam vessel of the navy, was built under his direction; and when in 1837 he was promoted to the rank of captain, he handled her with such skill that he fully proved the utility of steam vessels for naval purposes. In 1838 he was sent on special duty, to England and France to investigate the steam vessels of their navies. In 1841 he was promoted commodore and later assigned to command the squadron on the African Coast for suppressing the slave trade. In 1846 he was appointed second in command of the squadron in the Gulf of Mexico, and in 1847 succeeded Commodore Conner in command. In 1852 he was entrusted by President Fillmore with a letter to the ruler of Japan for the purpose of establishing diplomatic and trade relations, and was given command of a squadron which reached Japan in July 1853. He delivered President Fillmore's letter at Kurihama and returning to Japan early in 1854 concluded, at Yokohama, the treaty which inaugurated a new era in the history of Japan. He gave the Japanese an industrial exposition of American products and manufactures, including an illustration of the railway and telegraph at work. On 14 July 1901, saluted by the guns of three American war vessels under Commodore Frederick Rodgers, grandson of Perry, and of a fleet of Japanese vessels, graded from gunboat to battleship, a superb monolith of Sendai granite, inscribed in letters of gold, written by the Marquis Ito, and to which the emperor himself had subscribed a thousand yen, was unveiled in Perry Park at Kurihama, where the President's letter had first been delivered. Beside many brief biographies in Japanese, consult 'Matthew Calbraith Perry, a Typical American Officer' by William Elliot Griffis (1887).

PERRY, Oliver Hazard, American naval officer: b. South Kingston, R. I., 23 Aug. 1785; d. Trinidad, 23 Aug. 1819. He entered the navy as a midshipman in 1799, cruised among the West Indies, served in the war against Tripoli and in 1807 was commissioned lieutenant, and in 1809 given command of the schooner *Revenge*, which in 1811 was wrecked on Watch Hill Reef near Stonington, Conn. An official court of inquiry acquitted him of all blame. At the outbreak of the War of 1812 he was in command of a division of gunboats at Newport, R. I., but in February 1813 was transferred, at his own request, to Lake Erie under the command of Commodore Chauncey. He was then ordered to Presque Isle (now Erie) to superintend the construction and equipment of a fleet; and by August had built and manned nine vessels. Taking advantage of the temporary absence of the British squadron which had been watching him, he succeeded in getting his fleet out of port, and brought the British to an engagement on 10 September, which resulted in a complete victory for the Americans. (See *ERIE, LAKE, BATTLE OF*). Perry immediately sent to General Harrison the dispatch which has become famous in American history, "We have met the enemy and they are ours." This battle was most important as giving the Americans the control of Lake Erie and enabling Perry to co-operate with General Harrison and the land forces in the operations which resulted in the English evacuating Detroit and the victory at the Thames River. Perry became in the estimation of the people one of the chief heroes of the war, and high honors were paid him wherever he went. Congress gave him a gold medal in recognition of his services, and he was promoted captain. A controversy later arose between Perry and Elliott, the commander of the *Niagara*, as to the part employed by the latter in the battle. In 1814 he was appointed to command the *Java*, then being equipped at Baltimore; and as the Chesapeake was closely blockaded, he found it impossible to get to sea, but was actively engaged in the defense of Baltimore. After the war he cruised in the *Java* on the United States Coast and in the Mediterranean with Decatur's squadron. He was appointed commodore, and in 1819 given command of a squadron for the West Indies and South America. In July of that year he ascended the Orinoco River to Angostura, and on leaving the river was seized with yellow fever, which caused his death on the day that his ship reached Port Spain, Trinidad. He was buried there, but in 1826 his remains were transferred in the *Lexington* to Newport, R. I. Statues of him have been erected at Newport and at Cleveland, Ohio. Consult the 'Life' by Mackenzie, A. S. (Akron, Ohio, 1910), and that by Lyman (New York 1905); Barnes, 'The Hero of Erie' (New York 1898); Cooper, 'Lives of Distinguished Naval Officers' (New York 1846).

PERRY, Peter, Canadian statesman: b. Lennox County, Ontario, 1793; d. 1851. For many years he pursued successfully the career of a farmer after which he became a merchant. Taking an active interest in politics he was one of the founders of the Reform party in Ontario in 1824, and from 1824 to 1836 sat in the Upper Canada legislature as Liberal mem-

ber for Lennox and Addington counties. In 1841 he was elected to the Canadian legislative assembly. Perry was an advanced Liberal and was undoubtedly ahead of his time in political thought. As a result he was dissatisfied with the program of the Reform party and organized the Clear Grit, or Advanced Reform party.

PERRY, Ralph Barton, American philosopher: b. Poultney, Vt., 3 July 1876. He took his baccalaureate at Princeton in 1896 and his master's and doctor's degree at Harvard in 1897 and 1899, respectively. After teaching at Williams and Smith colleges he came to Harvard in 1902 as instructor, and in 1913 he became professor there. He is especially known as an exponent of the New Realism. He has edited Williams' James' 'Essays in Radical Empiricism' (1912), and has published 'The Approach to Philosophy' (1905); 'The Moral Economy' (1909); 'Present Philosophical Tendencies' (1912); 'The New Realism' (as co-author, 1912); 'The Free Man and the Soldier' (1916).

PERRY, Roland Hinton, American painter and sculptor: b. New York, N. Y., 25 Jan. 1870. He was educated at a private school in New York, entered the École des Beaux Arts in 1890 and studied at the Académie Julien and Académie Delacause, Paris, in 1890-94. His principal works are the bas-reliefs of Sibyls and the 'Fountain of Neptune' in the Library of Congress (1895); 'Cain' (1892) and 'Death of Sigurd' (1898), paintings in the Detroit Museum of Art; 'The Valkyrie,' painting (1899); 'The Lion in Love,' sculpture (1899); spandrels on Dewey Arch, New York (1899, since razed); 'Statute of Circe' (1900); the Langdon doors of the Buffalo Historical Society (1901); frieze for the New Amsterdam Theatre, New York (1903); statue of Dr. Benjamin Rush, Washington (1904); figure of 'Pennsylvania' atop the capitol at Harrisburg, Pa. (1904); statue of Gen. George S. Greene, Gettysburg (1906); group for New York State monument for Lookout Mountain, Tenn. (1907); lions for Connecticut Avenue Bridge, Washington (1908); New York State memorial at Andersonville, Ga. (1910); equestrian statue of Gen. John B. Castleman, of Louisville, Ky.; statues of General Curtis for Ogdensburg, N. Y., and of General Wadsworth at Gettysburg. Since 1916 Mr. Perry has devoted himself to portrait painting.

PERRY, Thomas Sergeant, American educator and critic: b. Newport, R. I., 23 Jan. 1845. He was graduated at Harvard in 1866; was tutor in German there, 1868-72; and instructor in English, 1877-81; professor of English in Keiogiijiku University, Tokio, 1898-1901. He has spent much time abroad, and his writings, which are mainly critical and historical, include 'Life and Letters of Francis Lieber' (1882); 'The Evolution of the Snob' (1887); 'English Literature in the 18th Century' (1883); 'From Opitz to Lessing' (1884); 'History of Greek Literature' (1890); 'Life of John Fiske' (1905).

PERRY, William Stevens, American Protestant Episcopal bishop: b. Providence, R. I., 22 Jan. 1832; d. Dubuque, Iowa, 13 May 1898. He was educated at Harvard College, where he was graduated in 1854; prepared for the min-

istry at the Virginia Theological Seminary, was ordained deacon in 1857 and priest in 1858. After holding various charges in New England and for a time editing the *Church Monthly*, published in Boston, he became rector of Trinity Church, Geneva, N. Y., in 1869. Here he remained for the next seven years, during the last six months of which time he was also president of Hobart College. He had already acted as professor of history there 1871-73, and had been in 1868 appointed, in succession to Dr. Hawks, historiographer of the Episcopal Church, a position which he held until his death. In three successive general conventions, beginning with the year of this appointment, he was secretary of the House of Clerical and Lay Deputies. In 1876 he entered the upper house by his consecration as bishop of Iowa. In addition to his ordinary episcopal labors, he was in general demand as a preacher, and continued during the rest of his life his historical studies. The fruits of these remain especially in the valuable 'Historical Collections' illustrating the history of the Episcopal Church in various States, and the publication of the journals of the General Convention, with notes and appendices, at first in collaboration with Dr. Hawks and afterward independently. He published also a connected 'History of the American Episcopal Church, 1587 to 1883' (1885) and other works.

PERRY, Iowa, city, of Dallas County, on the Chicago, Milwaukee and Saint Paul and the Minneapolis and Saint Louis railroads, 35 miles northwest of Des Moines. It has extensive agricultural interests and manufactures cement blocks, tile spades, washing machines, etc. It contains a public library and is the seat of Jones College. The city owns the water-supply system. Pop. (1920) 5,642.

PERRY, N. Y., village in Wyoming County, on the Buffalo, Rochester and Pittsburgh Railway, 55 miles southwest of Rochester. The village has a public library, a masonic temple and modern school buildings, knitting mills, cutlery factory, machine shops, etc. The water-supply system is the property of the village. Pop. (1920) 4,717.

PERRY, Okla., city, county-seat of Noble County; on the Atchison, Topeka and Santa Fé Railroad, about 30 miles northeast of Guthrie. It is in an agricultural region, in which stock-raising is an important industry. The chief manufactures are flour, feed, machine repair-shops and cigars. It has an extensive trade in grain and livestock. Perry was settled in 1889 and a United States landoffice is stationed here. It has a Carnegie library, public parks and operates municipal waterworks and electric-lighting plant. Pop. 3,200.

PERRY, a fermented beverage made from the juice of pears.

PERRYVILLE, Battle of, and the Kentucky Campaign of 1862. After the expulsion of the Confederate army from Corinth, Miss. (q.v.), 29 May 1862, General Halleck's large army of 137,000 men was unfortunately and, as it afterward proved, mistakenly divided, and the army of the Ohio, under Gen. D. C. Buell, 10 June, upon a peremptory demand from the authorities at Washington, was ordered to move on Chattanooga, the movement beginning

next day along the line of the Memphis and Charleston railroad. This railroad had to be rebuilt as the army moved forward, and from its location it was constantly under attack and destruction by enemy raiders. The Union arms had opened the Mississippi to Memphis and Vicksburg, and all the country north of the line of the Memphis and Charleston Railroad and Tennessee River, as far east as Bridgeport, Ala., and following the Cumberland Mountains northward, to the Ohio River, had come into Union possession. The two great States, Kentucky and Tennessee, except the eastern part of the latter, and the key to the railroad system of the South were held by Union troops. The advance of the Union armies on Chattanooga and Knoxville, in June and July, led to prompt reinforcement of Chattanooga and Knoxville by the Confederates, and Gen. Braxton Bragg was authorized to make a counter movement into Middle Tennessee and Kentucky. The idea obtained in the South that the people of Kentucky would rise and swell the Confederate ranks, and at Richmond it was thought that Bragg could march through Tennessee and Kentucky to the banks of the Ohio and beyond. Bragg was then at Tupelo, Miss., and Gen. E. Kirby Smith was in command of the department embracing Chattanooga and Knoxville with a force of 15,000 men. Information led both to believe that, if properly armed, at least 25,000 in Kentucky and Tennessee would join their armies. At the same time Generals Earl Van Dorn and Sterling Price were to move from Mississippi into West Tennessee and Bragg thought that all his forces would unite in Ohio. On 21 July he ordered his own army of 45,000 from Tupelo to secure Chattanooga against Buell's advance, and to prepare for movement to the Ohio. Bragg divided his army into two wings, the right commanded by Gen. L. Polk, the left by General Hardee. He crossed the Tennessee at and above Chattanooga on 21-24 August, and his column of 30,000 men took up the march over Walden's Ridge and the Cumberland Mountains. Turning Buell's left, whose advance was at McMinnville and Altamont, it threatened Nashville; whereupon Buell ordered a concentration of his army at Murfreesboro, where they arrived 3-5 September. Hearing there of Nelson's defeat at Richmond, Ky. (q.v.) on 30 August he fell back to cover Nashville and his connections with Louisville. Bragg now turned northward for Louisville and the Ohio. He entered Kentucky 5 September, about 45 miles above Nashville, and halted at Glasgow on the 12th. On the 13th he found that Buell was ahead of him on the railroad from Nashville to Bowling Green. Bragg, however, marching from Glasgow across the country, with a force of 25,000, captured Munfordsville, with over 4,000 men, 17 September, and took up a strong position on the south side of Green River, intending to give Buell battle, but owing to want of supplies he changed his mind. He released his prisoners on parole and on the night of the 19th abandoned his position, which Buell, marching from Bowling Green, was about to attack, and marched for Bardstown, thus leaving the road to Louisville open to Buell, who entered the city on the 25th. Bragg seems to

have given up all idea of fighting and devoted all his energies to foraging for supplies and endeavoring to raise recruits for his army. He was eminently successful in the first, gathering huge droves of cattle and trains of provisions, and some recruits joined him. Though he had been at first headed for Ohio, he was now traveling away from it. Meanwhile E. Kirby Smith had occupied Lexington, Paris, Frankfort and Cynthiana, and sent General Heth to threaten Covington and Cincinnati. On 18 September Smith was in motion to join Bragg at Shelbyville, but hearing of Gen. Geo. W. Morgan's evacuation of Cumberland Gap (q.v.) and retreat northward, he suspended his movement westward and marched his entire army east toward Mount Sterling, to intercept Morgan. In this he failed, and as Bragg reports: "The delay caused by the necessity of Smith's going prevented his forming junction with my forces at Shelbyville, and enabled General Buell to reach Louisville before an assault could be made by the combined force." Smith next marched back to the vicinity of Frankfort, Bragg in person joining him from an inspection tour, with the information that Buell was moving out of Louisville.

On reaching Louisville Buell found thousands of volunteers pouring in from the West, and Grant sent him a detachment, increasing the army of the Ohio to nearly 100,000. The army was ready to march against Bragg at Bardstown, where only Polk's corps remained, when on the 29th Buell was handed an order from Washington relieving him from command and assigning Gen. Geo. H. Thomas to succeed him. Thomas protested against the change of command, and the order was suspended, Thomas being announced in orders as second in command, but the straightening out process cost a delay of 24 hours. The three corps of the army were commanded by Gens. A. McD. McCook, T. L. Crittenden and C. C. Gilbert. On 1 October Buell's army of 68,000 fighting men moved out of Louisville in three columns against Polk at Bardstown. General Sill with his own division and Dumont's marched direct to Frankfort to threaten E. Kirby Smith. Bragg, at Frankfort, believing that Sill was but the advance of Buell's main body marching for that place, ordered General Polk to move the entire army from Bardstown toward Frankfort and to strike Sill and Buell in flank, while E. Kirby Smith, advancing from Frankfort, met the Union column in front. But Polk, finding that he had Buell's whole army before him, disregarded Bragg's order and retired slowly by way of Perryville toward Harrodsburg, where he thought that the entire Confederate army in Kentucky would be concentrated. When Bragg heard of this, 4 October, he, Smith and others were formally inaugurating a secession governor of Kentucky at Frankfort, a ceremony that was cut short upon the announcement that Sill was rapidly approaching. Smith, accompanied by the newly inaugurated governor, retreated in haste toward Lexington. Dumont's division occupied the city, and Sill slipped away on the 8th to join Buell. Smith took position near Versailles, to cover Lexington and watch an advance from Frankfort. Polk, with two divisions, was ordered to join Smith. Hardee, with his two infantry divisions and Wheeler's

cavalry, was left to hold Perryville and cover the depot of supplies at Camp Dick Robinson. Meanwhile Buell's three columns were approaching Perryville. Gilbert, with the centre, preceded by a brigade of cavalry, drove back Wheeler, and on the night of the 7th went into camp four miles from Perryville, about 40 miles south of Frankfort. Crittenden, with the right, was to have encamped at Hayesville, but finding no water, he marched three miles to the west. McCook, with the left, after some resistance, reached Mackville, 10 miles from Perryville, the same distance from Harrodsburg, and six miles in rear and to the left of Gilbert. Late in the afternoon Bragg, at Harrodsburg, heard from Hardee that he was being pressed by Gilbert, whom the Confederates supposed to be isolated from the rest of Buell's army and ordered Polk to join Hardee with Cheatham's division and attack Gilbert. Hardee and Polk urged a union of Bragg's and Smith's armies before giving battle. Early in the morning of the 8th, when it was seen that the Union forces were advancing, Polk, correctly informed that the greater part of Buell's army was in his front, determined to disregard Bragg's order to attack, and after consultation with Hardee and other officers, he concluded "to adopt the defensive-offensive." The battle began in an effort of the Federals to get water, through gaining possession of the springs at Perryville, in quest of which Col. Dan McCook's brigade advanced at 3 A.M. of the 8th and took position in advance of Chaplin's Creek. After daylight it was joined by the remainder of Sheridan's division, followed by Mitchell's and a brigade of Schoepf's. Sheridan moved up the road, driving back strong skirmish-lines, and nearly a mile in advance, with Mitchell on his right, he formed line of battle on ground overlooking a branch of Doctor's Creek. It was nearly 11 A.M. when Rousseau's division, the advance of McCook's corps, came up on the left of Sheridan, about 400 yards from him. Lytle's and Harris' brigades were put on the right. Terrill's brigade of Jackson's division on the left, Webster's brigade of Jackson's division in rear of Rousseau, and Starkweather's brigade of Rousseau's division, with two batteries on high ground, to the left and rear of Terrill's brigade. Soon infantry and artillery on both sides were engaged. The battle was mainly fought on McCook's line. Buell's army numbered about 58,000 men, and was confronted by 16,000. But this inequality was not suspected by either side. Buell thought the whole of Bragg's command was before him and made careful plans for an attack on the following day. The Confederates believing they faced only a single corps attacked courageously.

General Bragg came upon the field from Harrodsburg about 10 A.M., and was surprised and angered when informed by Polk that he had assumed the defensive-offensive. Cheatham's division of 7,000 arriving, Bragg made some changes in the disposition of the troops, moving Cheatham's division to the right, and ordered Polk to open the attack. Polk was dilatory, and Bragg led the entire line forward, his left striking Sheridan, and the centre and right falling furiously upon McCook at 2 P.M., immediately involving his entire line in a desperate struggle. Terrill's brigade, on the left, but

partially formed, received a heavy blow from Cheatham's division and Wharton's cavalry; General Jackson, the division commander, was killed at almost the first fire, while directing the fire of Parson's battery; and the brigade, composed of raw troops, after inflicting severe loss on Maney's brigade, was routed, abandoning seven of Parson's eight guns. The Confederates, advancing, struck Starkweather to the rear and left of Terrill, and were checked and repulsed by the fire of his two batteries and unyielding infantry, the attacking brigades of Maney and Stewart losing nearly half their men. Later in the action Starkweather was obliged to yield some ground, and General Terrill, in a vain effort to rally a part of his brigade on him, was mortally wounded. From the attack upon Terrill the battle rolled down the line upon the brigades of Lytle and Harris, of Rousseau's division, the greater part of Buckner's division attacking them with fury and, taking advantage of an interval of 400 yards between the right of Rousseau and the left of Sheridan, pressing their attack at this point. Colonel Webster sprang to Rousseau's support and was killed; his brigade, with those of Lytle and Harris, were soon overpowered and forced back nearly a mile; Lytle was seriously wounded and taken prisoner; and the three brigades, terribly thinned, were about to dissolve in fragments, when Colonel Gooding's brigade, of Mitchell's division, came up from the right, made a gallant charge, and after nearly an hour's contest, in which it lost 499 killed and wounded, one-third of its strength, checked the Confederate advance and then threw it back beyond Chaplin's Creek. Steedman's brigade arrived about sunset and Lieut. F. G. Smith's battery, supported by the 18th United States Infantry, was pushed forward and opened with canister; but it soon grew dark and the firing ceased on both sides. On McCook's right Sheridan was attacked by a part of Buckner's division and that of Anderson. He had a good position and, beside checking the assault on his own front, helped McCook by turning his artillery upon the flank of the troops opposing him; but unfortunately Gilbert, his corps commander, ordered him and Mitchell to fall back, thus uncovering McCook's right. However, he soon advanced, held his ground, though severely pressed, and as his right was strongly threatened, Mitchell sent General Carlin's brigade to his assistance. Carlin formed on his right and, making an impetuous charge, broke the Confederate lines and drove them back through Perryville, capturing in the town 15 to 20 caissons and wagons, loaded with ammunition, and a guard of 140 officers and men. This was about nightfall and ended the battle on that part of the field. Crittenden's corps, on the right, was not engaged and had but two men wounded. Of Buell's 58,000 men on the field less than half were engaged. The noise of the action had been muffled by the surrounding woods and Buell was unaware of the battle till 4 P.M. The Union loss was 845 killed, 2,851 wounded and 515 missing, an aggregate of 4,211. The Confederate loss was 510 killed, 2,635 wounded and 251 missing, an aggregate of 3,396. Considering the number of men engaged and the brief duration of the battle, it is regarded as the bloodiest engagement of the Civil War.

During the night Bragg, abandoning his dead and many wounded, and 13 of the 15 guns he had captured, withdrew from the field, and at daylight he retreated to Harrodsburg, where he was joined by E. Kirby Smith, raising his command to over 60,000 men. Buell awaited the arrival of Sill's division, which arrived on the 11th, and next day advanced and maneuvered to turn Bragg's left. Bragg fell back to Bryantsville, and on the 13th he began his retreat from Kentucky by way of Cumberland Gap. Buell pursued, the bulk of his army stopping at Crab Orchard, the advance going as far as London, where pursuit ended, and Buell moved back to the line of the Louisville and Nashville Railroad. Bragg continued his retreat, passing through Cumberland Gap 19-26 October.

The Confederate campaign into Kentucky was a failure and a sore disappointment to General Bragg and his government. In his report Bragg says: "The campaign was predicated on a belief and the most positive assurance that the people of this country would rise in mass to assert their independence. No people ever had so favorable an opportunity, but I am distressed to add there is little or no disposition to avail of it. Willing perhaps to accept their independence, they are neither disposed nor willing to risk their lives or their property in its achievement. With ample means to arm 20,000 men and a force with that to fully redeem the State, we have not yet issued half the arms left up by casualties incident to the campaign." Consult 'Official Records' (Vol. XVI); Fry, 'The Army under Buell'; the Century Company's 'Battles and Leaders of the Civil War' (Vol. III).

E. A. CARMAN.

PERSEPHONE, *pēr sēph'ō-nē* (Greek *Περσεφόνη*; Lat. *Proserpina*; other Greek forms appear), in Greek myth, according to some the daughter of Zeus and Styx, or, according to the more usual tradition, the daughter of Zeus and Demeter (Ceres). Pluto carried her off, with the consent of Zeus, and made her his wife. This fable has been treated by several poets and adorned in different ways. In Homer, where she bears the name of *Persephoneia*, no mention is made of her having been carried off by Pluto against her will. She is simply represented as the majestic and awful wife of Pluto and queen of the lower world. According to the later story *Persephone* was once dancing in the choir of nymphs led by Athena and Artemis in a grassy meadow. Leaving the dancers she went with some of her companions to gather flowers. At the prayer of Pluto, and with the consent of Zeus, the earth produced 100 blooming narcissuses from one root, and gods and men were astonished at their beauty and delighted by their odor. The maid eagerly gathered them, and, beguiled by their magic power, wandered from her companions. Suddenly the earth opened, and Pluto, rising from the chasm with his immortal steeds, seized *Persephone*, and carried her in a golden chariot to the lower world. She called loudly on her father for protection, but in vain; no one heard her cries except *Hecate* and the Sun.

In vain did Zeus attempt to obtain her mother's consent to her marriage with Pluto and he at length granted her permission to return to the upper world provided she had not

tasted any of the food of the gods. But while walking through the lovely fields of Elysium she had eaten a pomegranate, and all that Zeus could grant to the prayers of her afflicted mother was that she should spend the spring and summer of each year in the upper world. See DEMETER.

The chief seats of the worship of Persephone were Attica and Sicily, although her worship was not wholly neglected in any part of Greece or in any of the Greek colonies. Sometimes she shared the honors paid to her husband, sometimes those paid to her mother, and sometimes particular celebrations were dedicated to her alone. In Attica she bore the name of Kore, that is, the daughter, namely, of Demeter, who is sometimes called *He Meter*, the mother; and the Eleusinian mysteries (q.v.) held in September, were sacred to both. The story of Persephone in the simple form in which it is given by the Greek poets is universally held to be a mythical account of the changes of the seasons, and this interpretation is so obvious that the ancients themselves saw in the abduction of Persephone a symbol of autumn when the fruits of nature disappear; and in her return a symbol of spring. This idea of the myth is beautifully worked out in Schiller's ballad, 'Klage des Ceres.'

PERSEPOLIS, pèr-sép'-ô-lis, in ancient geography a capital of the Persian empire, near the junction of the Araxes River (now the Kur) and the Medus (now Polvar), and 35 miles northeast of the modern city of Shiraz. Persepolis is Greek for 'Persian City'; the form of the Persian name is unknown, but as the earlier notices in Greek authors call it *Persæ*, and as it succeeded *Pasargadæ* (q.v.), whose name possibly means "the city of the Persians," it may be conjectured that the Greek name is a translation of the Persian and not a new appellation. The city, probably already a great one, became the Persian capital under Darius I. Both Darius and Xerxes did much to build up and beautify the city, which was strongly fortified with a triple wall about the citadel, on which were the royal palace and treasury. This part of the city was destroyed by Alexander the Great (about 330 B.C.); but the northern part, the real city, was unharmed and retained some importance down to the 1st century B.C. About 200 A.D. *Istakhr* arose here and became a royal city of the Sassanids down to 632 A.D. The ruins of Persepolis are among the most important of the remains of ancient Persia. They lie in the desert plain of *Merdasht* nearly hemmed in by mountains, which are sufficiently described in the native name of *Seh Gumbeddān*, that is, "the three cupolas"; the natives call the ruins *Takhti Jemshed* ("Jemshed's Throne"), *Tchil Minar* ("Forty Pillars"), and *Nakshi Rustem* ("Rustem's Picture"). The first two names are variants and are applied to the buildings topping three terraces, up which lead a double staircase, broad enough for 10 men to pass abreast, with a slope so gentle that it is easy to ride up on horseback over the 106 steps. The second terrace, 35 feet high and 550 feet long, has at the entrance of a great propylæa, attributed to Xerxes, portals with four figures of winged bulls, two of them with men's heads, closely resembling the Assyrian statues in *Nineveh*.

Southeast of the propylæa is Xerxes' throne room with 13 great columns 64 feet high and 29½ feet apart, still standing; it seems to have been open to the air. At one side is the enclosed pavilion of Darius, 250 feet square, which had 100 columns. North of *Takhti Jemshed* are the tetragonal pyramidal remains of an ancient fire temple. Consult *Curzon*, 'Persia' (1892); *Dieulafoy*, 'L'Art antique de la Perse' (1884-89) and *Mme. Dieulafoy*, 'La Perse, la Susiane et la Chaldée'; *Fergusson*, 'The Palaces of *Nineveh* and *Persepolis Restored*' (1851); *Stolze and Andreas*, 'Die achämenidischen und sassanidischen Denkmäler und Inschriften von *Persepolis*' (1882); and *Stolze*, 'Persepolis' (1892).

PERSEUS, pèr'sūs, last king of the Macedonians, son of Philip V; b. about 212 B.C.; d. Alba, Italy, about 163 B.C. He succeeded to the throne in 179 B.C., renewed the treaty with Rome which his father had been preparing to break, but continued the preparations for war in which he had been engaged. In 168 B.C. the Romans sent *Lucius Æmilius Paulus* against him, and after a campaign of 13 days the Macedonian army was routed. Perseus escaped to *Samothrace*, but was captured by the Romans and died in honorable captivity at Alba some years later. Consult *Droysen*, 'Geschichte des Hellenismus' (2 ed., 1877-78); *Mahaffy*, 'Alexander's Empire' (1888).

PERSEUS, fabulous Greek hero, son of *Danaë* and *Zeus*, and grandson of *Acrisius*. In consequence of an oracle which had foretold that *Acrisius* would die by the hands of a son of *Danaë* (See *DANAË*) he was sent to sea on his birth, in a chest with his mother. But the chest reached the island of *Seriphos*, and on being opened both mother and son were found to be alive. *Dictys*, a fisherman who found them, conveyed them to his brother, *Polydectes*, king of the island, at whose court Perseus was brought up. *Polydectes* at first treated Perseus with kindness but when he was grown up became anxious to get rid of him, as he thought he would prove an obstacle in the way of his gratifying a passion which he had conceived for his mother *Danaë*. Under pretense, therefore, of suing for the daughter of *Cenomaus*, he requested from his friends presents of rarities to make his wedding feast more splendid; and when Perseus professed willingness to bring him anything that he desired, even the head of the Gorgon *Medusa*, bade him bring what he had mentioned. Conducted by *Hermes* and *Athena*, he first went on to the western coast of the ocean, to the three *Graiaë*, who had but one eye and one tooth in common. Perseus got possession of these, and promised to restore them on condition that they would bring him to the nymphs, who kept the instruments which he needed in this enterprise—the talaria, or winged shoes, the bag, and the helmet of *Pluto*, which made its wearer invisible. Led by *Hermes* and *Athena*, he reached the slumbering Gorgons. With his face averted he approached the monsters whose look transformed the spectator into stone, saw the head of *Medusa* by reflection in his brazen shield, and cut it off. Upon his return, he transformed *Polydectes*, with all his associates, into stone; and having placed *Dictys* upon the throne of *Seriphos*, returned to *Hermes* the talaria, bag and helmet,

and gave to Athena the Gorgon's head which she fixed in the centre of her shield, or, according to some, on her breastplate. Perseus then went to Argos to visit his grandfather, Acrisius. To avoid the predictions of an oracle Acrisius had fled to Thessaly, but could not escape his destiny, for Perseus followed him there and killed him accidentally with the discus, of which he was the inventor. In consequence of this event he refused to ascend the throne of Argos, which had thus fallen to him, and exchanged it for Tiryns, the kingdom of Megapenthes. Here he founded Mycenæ.

In *astronomy*, a northern constellation of Ptolemy, exceedingly rich in objects of interest. In a good telescope the double cluster in the Sword-handle appears wonderfully rich in stars. Persues contains the variable star Algol (q.v.).

PERSEVERANCE, or **FINAL PERSEVERANCE**, generally referring to the doctrine that the salvation of any individual has been absolutely fixed from eternity, and that after the work of salvation has actually been begun, it will be carried forward without fail to a successful termination. (Consult Romans viii, 28-30). The Westminster Assembly's Confession of Faith declares: "This perseverance of the saints depends not upon their own free-will, but upon the immutability of the decree of election flowing from the free and unchanging love of God the Father; upon the efficacy of the merit and intercession of Jesus Christ; the abiding of the Spirit, and of the seed of God within them; and the nature of the covenant of grace—from all which ariseth also the certainty and infallibility thereof."

In the Arminian theology the possibility and even danger of the falling away of saints is admitted, and it is declared that free-will governs in the adherence to Christ, and does not cease to govern in the abandonment of him. The Calvinist, in argument, does not deny such conditions, but insists that the absence of perseverance in itself proves that actual salvation was never begun for those who afterward became backsliders.

In the Roman Catholic theology the term Final Perseverance signifies the preservation of the state of grace till the end of life on earth; that is, from the last conversion until death—regardless of previous lapses. It is viewed both as a power, and as a fact: In the first sense the combination of spiritual means whereby it becomes possible for the human will to persevere; in the second, an accomplishment by the constant aid of divine oversight and care, and in its eventuality a divine gift, beyond any merit achieved by the human devotee. Consult Hodge, C., 'Systematic Theology' (New York 1877); Newman, Cardinal, 'Tracts Theological and Ecclesiastical' (London 1874).

PERSHING, Cyrus L., American jurist: b. Youngstown, Westmoreland County, Pa., 3 Feb. 1825; d. Pottsville, Pa., 29 June 1903. He sustained himself as a clerk and teacher at Jefferson College, Pa., where he was graduated in 1848, and was admitted to the bar in 1850. He practised his profession in Johnstown, Pa., and was elected to the legislature in 1861, 1862, 1863, 1864 and 1865. In October 1872 he was elected president judge of Schuylkill County,

presiding during the trial of the members of the "Molly Maguire" association, and was nominated for the governorship of his State by the Democrats in 1875. He was a frequent contributor to the law journals of Pennsylvania.

PERSHING, John Joseph, American general: b. Linn County, Mo., 13 Sept. 1860. He was graduated at the United States Military Academy at West Point in 1886 as senior cadet captain, when he received his commission of second lieutenant in the Sixth United States Cavalry, and saw his first active service in the same year in the Apache Indian campaigns in Arizona and New Mexico. In 1890-91 he took part in the Sioux campaign in South Dakota, commanding for a time the Sioux Indian scouts. Appointed military instructor in the University of Nebraska in 1891 (where he took his LL.B. degree), and transferred to the 10th Cavalry as first lieutenant in 1892, Pershing continued his lectures at the university till 1895, and two years later became instructor in tactics at West Point. He won special commendation in the Cree campaign of 1896, and in 1898 was made chief ordnance officer in the volunteers with the rank of major, served in Cuba and organized the Bureau of Insular Affairs there, acting as chief of that department till August 1899, when he left the volunteers and was sent to the Philippines. For four years he was engaged there as adjutant-general in the department of Mindanao and in command of the military operations against the Moros, a "fierce, proud and restive" tribe of Mohammedans that had defied Spanish authority for centuries. Pershing's unqualified success in subjugating the Moros and even winning their confidence and friendship was a skilful exhibition of military and diplomatic talents that did not fail to attract the attention of the authorities at Washington. In his message to Congress on 7 Dec. 1903 President Roosevelt paid a handsome tribute to Captain Pershing's achievements. Criticizing the inadequate system of promotion and reward for meritorious service, the President wrote, "The only people who are contented with a system of promotion by mere seniority are those who are contented with the triumph of mediocrity over excellence. . . . Moreover, when a man renders such service as Captain Pershing rendered last spring in the Moro campaign, it ought to be possible to reward him without at once jumping him to the grade of brigadier-general." The President's words aroused considerable opposition both in Congress and in army circles. The matter was held up for nearly three years, but on 20 Sept. 1906 it was officially announced that Captain Pershing was promoted to brigadier-general over the heads of 862 officers who ranked him in the service. Meanwhile, during 1905-06, Pershing served as military attaché at Tokio and spent a year with General Kuroki's army in the Manchurian campaign against Russia, thus gaining valuable experience of modern warfare and large-scale operations. The next years were spent in departmental and routine duties till the Mexican imbroglio of 1915, when Pershing was placed in command of a punitive expedition against the bandit Francisco Villa. While engaged on this service, stationed at El Paso, Tex., a sad domestic tragedy befel him. In 1905 Captain Pershing had married Miss Francis Warren, daughter of Senator Warren

GENERAL JOHN JOSEPH PERSHING

Commander-in-Chief of the American Expeditionary Force in France (1917-1919)

of Wyoming. Four children were born to them. On 27 Aug. 1915 Mrs. Pershing and her three little daughters lost their lives by a fire in the Presidio at San Francisco. The son, a boy of five, alone was rescued.

On the entrance of the United States into the European War, Pershing was chosen (18 May 1917) to command the American Expeditionary Force to be sent to Europe. He preceded the troops with his staff of 53 officers and 146 men and arrived in England 8 June 1917. After studying military conditions and conferring with the king, ministers and officials, Major-General Pershing proceeded to France, arriving at Boulogne on 13 June. On 6 Oct. 1917 the United States Senate revived the ranks of general and lieutenant-general, and Pershing was elevated to full general, being the fourth American soldier to hold that rank since Washington. The object of the change was to place the American commanders in Europe on a level with those of the Allies. The great German offensive which opened 21 March 1918 and almost brought disaster upon the Allies led to the appointment of General Foch (q.v.) as generalissimo on the Western front and brought about that unity of action already long overdue. At a critical moment General Pershing placed the whole of his forces at the disposal of General Foch in the name of the President and people of the United States. On 3 Aug. 1918 the French government conferred the Grand Cross of the Legion of Honor upon General Pershing in recognition of the great services he rendered to the Allied cause. On that occasion Premier Clemenceau telegraphed to the general: "France shall never forget that it was at a moment when the struggle was most bitter that your splendid troops came to add their efforts to ours. This cross shall be the symbol of our gratitude." At the close of the war General Pershing received the American Distinguished Service Medal. He was also decorated with the Grand Cross of the Order of the Bath (British), Grand Cordon of the Paulownia (Japan), Grand Cross of Saints Maurice and Lazarus (Italy), the Order of Leopold (Belgium) and the Cross of the Military Order of Michael the Brave (Rumania). The British decoration carries with it the title of "Sir". On 4 Sept. 1919 General Pershing was confirmed by the United States Senate "General of the Armies of the United States." On 1 July 1921 he became Chief of Staff of the United States Army, holding the position until reaching the age of retirement (64) on 13 Sept. 1924. See his Report under WAR EUROPEAN.

PERSIA (Persian *Irán*), a kingdom of western Asia situated between lat. 25° and 39° 45' N. and between long. 44° and 63° E.; area, about 628,000 square miles; population, about 9,500,000. According to various treaties with Russia and Turkey, and the Seistan-Afghan Boundary Commissions of 1870 and 1905, Persia is bounded on the north by Armenia and Azerbaijan along the river Aras (Araxes) to the plain of Mogan and the Lenkoran district (both Russian) on the Caspian; by the coast of the Caspian, and the former Tekke Turkoman country, now known as the Russian Transcaspian territory. This last-mentioned frontier is not definitely fixed. On the west, Persia borders on Mesopotamia, though here, again,

the frontier line is still in dispute. On the southwest and south the Persian Gulf and the Arabian Sea form natural frontiers. On the east, toward Afghanistan and Baluchistan, the boundary was fixed by the Perso-Seistan Boundary Commission of 1903-05; here the dividing line runs from Sarakhs on the Russo-Persian frontier (southeast of Merv) down to Gwattar on the Arabian Sea. Persia thus forms an irregular triangular mass with a base running from below Mount Ararat for about 1,000 miles southeast to the Gulf of Oman, and with nearly equal sides of 700 miles north and east from Ararat to Sarakhs, and thence southward to Gwattar, in long. 61° 30' E. The entire coast line on the south and west is over 900 miles.

Topography.—The centre of Persia is a vast plateau with a mean altitude of from 3,000 to 5,000 feet above sea-level, but it is by no means a flat tableland, for the country is almost everywhere traversed by lofty ranges to such an extent that the strictly highland really prevails considerably over the plateau formation. With few exceptions the ranges run diagonally from northwest to southeast. Some of the ridges run for over 100 miles at mean altitudes of from 8,000 to 10,000 feet, rising in some places to 16,000 or 17,000 feet. So far as it is yet known, the most extensive and loftiest range is the Koh-Dinár, traversing the western province of Fars at an elevation of perhaps 17,000 to 18,000 feet. Although still unexplored it is plainly visible from the Persian Gulf 130 miles away over intervening coast ranges known to be 1,000 feet high. The mountain range of southern Persia presents a succession of parallel ridges and valleys so that it is possible to drive between the ranges for some hundreds of miles. In the Elburz chain running over 500 miles from west to east and fringing the south coast of the Caspian, stands the giant Damavand, a volcanic mountain of about 19,000 feet high. This range continues on the eastern flank where it is known as the Ala-Dagh, and varies from 8,000 to 10,000 feet above sea-level, with numerous valleys interspersed, joining the Paropamesan range in Afghanistan. The separate ranges in the northwest merge in the general highland systems of Luristan, Kurdistan and Armenia, where several peaks rise to 15,000 feet. The parallel ranges in the northwest running southeast toward Baluchistan reach their greatest heights in the province of Fars and in the Bakhtiari district. The valleys between them are extremely fertile. The Kuruh-Koh range, running southeastward to Yezd, maintains a height of 10,000 feet for a long distance and is continued toward the Koh-i-Basmán (10,000 to 12,000 feet) by the snow-topped Koh-Banán and other lofty ridges, culminating with the Koh-Hazár (14,500 feet). In Sarhád, southeast of this point, the volcano Koh-i-Naushada rises to nearly 15,000 feet. In recent years it has been determined that the northern scarp of Khorasan is an eastern continuation of the Caucasus, and not of the Elburz Range. As the edges of the great Iranian Plateau are all higher than the earth level of its interior, hardly any of the rivers and streams find their way to the sea, but lose themselves in marsh and desert, e.g., the river Nendeh Rud, on the banks of which Isfahan is built, ends abruptly in a

broad shallow lake on the wide plain below. The general tendency of the plateau is to rise toward all the seabords and the western and northern frontiers. The traveler from Europe desiring to reach Teheran via the Caspian Sea must cross the Elburz Range; to penetrate the interior from the Persian Gulf, he must first overcome formidable mountain barriers and lofty passes. Between the coast ranges and the sea there is but little arable soil excepting, on the Caspian, the delta of the Safi-Rud, and a few strips along the Persian Gulf. This geographical inaccessibility has no doubt contributed largely to the backward state of the country in regard to civilization and prosperity. Once inside the natural ramparts of Persia, however, the traveler may find large tracts of fertile plains and valleys and still larger regions of dreary desert, waste and salt marshes, totally unfit for human existence or cultivation. Besides the rich plain of the Urmia Basin in the extreme northwest, extensive level tracts occur everywhere between the mountain ranges. A great portion of eastern Persia is occupied by the Great Salt Desert of Khorasan (Dasht-i-Kavir) and the Desert of Lut further south. These salt marshes, named *Kavir* in the north and *Kafeh* in the south, collect the rainfall and all the water from surrounding streams and form dangerous quagmires through which nothing can pass. There are several of such formations of considerable extent north of Kum, west of Yezd and south of Khaf. All the lakes are salt water, the greatest, in the northwest is Lake Urumieh; south of Teheran lies the Darya-i-Namák (Sea of Salt), while about 30 others are scattered through the country. The lakes have a curious habit of shifting their beds and moving from place to place. A "new" one made its appearance in 1883 which, according to the late Shah Muzaffar-ed-Din, was a lake that had dried up 1,300 years ago. Sterility and poverty are the predominant features of Persia. Great barren plains and equally bare mountains are the rule; for many miles not a tree, a shrub or a blade of grass is to be seen, and only camel-thorn and vetch are sparsely dotted about on the arid ground. At intervals the monotony is relieved in the spring by the green of the young crops around towns or villages. The only islands on the Persian Coast are the Kishm group in the Strait of Hormuz, claimed by the sultan of Oman, and the adjoining islands of Larak and Hormuz, belonging to Persia.

Hydrography.—The Karun is the only navigable river in Persia. Situated in the west, it rises in the Bakhtiari Mountains, flows by Shushter and Ahwaz into the Shatt-el-Arab above Mohammerah through an artificial channel, 45 miles from the Gulf, though a portion of its waters continues through its natural bed, the Bahmanshir, east of the Shatt-el-Arab, to the head of the Gulf, though on Persian territory. The Karkhá and Jarahi, the next largest rivers, also flow from the Luristan and Kurdistan highlands into the Shatt-el-Arab. South of the Karun flows the Tab, a sluggish waterway that helped to form the Arabistán delta, one of the richest alluvial plains of Persia. Still further south, the Minab drains all the wide plains across the hills of Bandar Abbas and flows by the town of Minab into the Strait of Hormuz. The largest river flowing into the

Caspian (east of Rasht) is the Safid-Rud (White River), which drains an area of 25,000 square miles south and east of Lake Urumieh. The Gurgan and Atrak (the latter perhaps eventually becoming the Russian frontier) reach the Caspian on the southeast coast below Chikishliar. The Keshef-Rud rises near Kabushan, joins with the Hari-Rud and forms the Tajand, which expands to a swamp short of reaching the Caspian. There are numerous inland rivers which lose themselves in lakes or deserts, the principal being the Aji-Chai and Jaghatu, flowing to Lake Urumieh; the Hamadan-Rud and Shurab, disappearing in the Great Kavir; the Zainda-Rud, watering the Isfahan district and running dry in the salt marsh of Gavkhana; the Kur (Bendamir), chief feeder of the salt lake Bakhtegan (Niriz); and the Mashkel, which filters along the Baluchistan frontier northward to the Hamun-i-Mashkel in the Karan desert.*

Climate.—There is a great diversity of temperature and rainfall, ranging between excessive heat and extreme cold. The moist, sultry and unhealthy climate round the Caspian and the Persian Gulf is entirely the opposite of the usually fine climate of the plateau, where the air is dry and exhilarating, enabling the vision to travel almost incredible distances. Yet extremes of heat and cold alternate in the interior; heavy snow falls during the winter in the northern parts from November till the middle of March. Though the sun may shine fiercely by day, the temperature falls as low as 15° or 20° at night. The summer heat is so intense that many escape to the hills to avoid it. Northwest and southeast winds prevail throughout the year with considerable uniformity, their direction being largely determined by the Black and Arabian seas and the parallelism of the intervening mountain ranges. These currents often meet on the southwest coast with the result that while a northwest gale is raging at Bushire on the Gulf, Bandar Abbas further south is exposed to the blazing fury of a southeaster. Violent sandstorms are frequent in the spring in the desert provinces, and hailstorms in which the stones are as large as marbles occur at the same season in the north. In one day's march a traveler may start from a frost-bound region and descend into a tropical zone of luxuriant palms and overwhelming heat. In Arabistán the dry heat in summer reaches over 120° indoors. To the extreme east, again, the climate is very unhealthy and excessively hot. Rainfall is scanty; about 50 inches fall annually at Resht on the Caspian and only five or six inches in central and southeast Persia. But for the mountains storing moisture in shape of snow, nine-tenths of Persia would be the arid desert that half of it is now. The rivers being few and small and the lakes all salt, most of the cultivation has to be carried on by means of irrigation, mountain-streams being conveyed to the towns by subterranean aqueducts requiring incessant labor to keep them open. Artificial canals and a system of wells connected by underground channels are also employed through the greater part of the country.

Flora and Fauna.—The deficiency of water

*The inland drainage of Persia amounts to nearly two-thirds of that for the whole Iranian plateau (of which Persia is the western section), covering an area of about 1,000,000 square miles.

is naturally reflected in the poverty of vegetation. Except on the outer slopes of the coast ranges hardly any trees or large shrubs are to be found. Along the Persian Gulf and the Arabian Sea the date-palm flourishes, the staple food and chief product of the country. The trees of the Bakhtiari and other inner ranges are mostly stunted in growth. Only on the northern slopes of the Elburz range are the true forests of the country—dense, large tracts of oak, elm, cedar, beech, box and walnut. The eastern plains of Khorasan and Karman are almost destitute of vegetation—a region of sands and salt. In some parts flowers are abundant, roses flourishing so profusely that they are cultivated for perfume. The Caspian provinces have also an exuberant vegetation and innumerable streams. The eastern province of Seistan is very fertile, but abounds in malaria and insect pests that breed in the great lagoon of Hamun. Along the Caspian seaboard wild animals are plentiful; hyæna, leopard, tiger cheetah, wild ass, jackal, lynx, porcupine and smaller beasts of prey. Lions exist in Farsistan. Wild goats, bustards and pheasants are hunted. The bulbul or Persian nightingale is celebrated in oriental poetry. The Gulf and the Caspian are rich in fish, the sturgeon fisheries in the rivers flowing into the latter are highly productive, but are exclusively operated by Russians. Fresh-water fish are rare, the numerous lakes being nearly destitute of animal life. The domestic animals are generally of inferior stock, though the Mazandaran black cattle are highly prized. Camels and mules are employed as carriers for the plains and highland regions respectively; a useful breed of small horses of mixed Arab blood is noted for speed. The famous "Persian cat" is well known in the West. Persia is infested with numerous weird types of reptiles, spiders and insects.

Minerals.—Though Persia possesses great mineral wealth, very little has been done to develop mining industries owing to the lack of communications. Lead and copper mines have been worked from time immemorial. Coal is mined about Tabriz in the north and Laristan in the southwest; iron, lead and copper occur in the Khamesh region and in Khorasan; coal and zinc are found near Teheran and tin in Azerbaijan; manganese ore, coal, lead and copper in Kerman. The famous turquoise mines near Naishapur have been known for ages. Between the Salt Sea and Isfahan the country is rich in iron and copper pyrites and mercury. There is also a quarry of Yezd marble, Yezd and Kerman, where Tabriz marble is also found. The pearl fisheries on the Gulf are very valuable, but are mainly worked by foreigners.

Population.—As already stated, the population of Persia is estimated at about 9,500,000. Under this estimate the inhabitants are distributed approximately—town residents, 2,500,000; peasants, 5,000,000; nomad tribes, 2,000,000. The nomad tribes are mainly Turks, Kurds and Leks, Arabs, Lurs, Baluchis and gipsies. The town residents in the principal cities are—Teherán, the capital, 280,000; Tabriz, 200,000; Isfahán, 80,000; Meshed and Kermán, each 60,000; Bârfurúsh and Shiráz, each 50,000; Yezd, 45,000; Resht, Kum, Hamadán, Kermansháh, Kashán and Kazvin, each 30,000 to 40,000.

Smaller towns are Dizful, 25,000; Nenjan, 24,000; Shushter Bandar Abbas and Burnjird, each 20,000; Sari and Mohammerah, each 15,000; Naishapur, 12,000; Astrabad and Bushire, each 11,000. By far the bulk of the people (over 6,000,000) belong to the indigent Iranian stock, Aryans, like the whites of Europe and America. The true Irani resembles the Spaniard or Italian in appearance. The frequent invasions of Persia by Central Asiatic tribes have left a strong element of the Mongols—Tartar type, while from the north and west were introduced into Persia the Arabs, Chaldeans, Jews and Armenians. The Persians proper, or western Iranians, are called Tajiks or Tats. There is little spiritual affinity between the Persians and the Turk; the latter is more serious and speaks little, while the former rather approximates to the French type—nervous, artistic, voluble, witty and polite. The moral and mental temperament of the Persians is not highly advanced. Ages of despotism have left the stamp of cruelty upon the Persian, which is exemplified in the savage sentences imposed by justice and the cold-blooded manner in which they are carried out under the indifferent gaze of the public. The natives of Kharasan show traces of Mongol and Usbeg blood in their broad, flat faces, high cheek-bones and brusque manner. The Persian Gulf is bordered by Arab tribes and throughout the whole country a shifting, nomad population, the Iliats, drive their cattle and carry their homes up into the hills in spring and summer and seek the warmer plains in winter. Their women are not veiled, like those of the towns and villages; adorned with valuable jewelry, they look not only healthy but happy, which latter is far from being the lot of the average Persian woman. There are about 1,200 Europeans, half of whom are British.

Religion and Education.—The Persians belong almost exclusively to the Shiañ sect of Islam; like the Turks, many of the Arab and Turki tribes as well as the Kurds belong to the rival faction, the Sunnites. The Lurs of the Bakhtiari region are nominally followers of the prophet, yet they possess neither mosques nor priests. Babiism (q.v.) counts many adherents, while there are about 10,000 Parsis or Guebres, some 50,000 Armenians and 30,000 Nestorians (both Christian), and about 43,000 Jews. Other religions are represented by Catholics, Greek Orthodox, Protestants and Zoroastrians. The chief priest of the Shiites resides in the holy city of Kerbela, near Bagdad.

Until recent years education was in a very backward state, being limited to reading the Koran in Arabic, which few were able to understand. There are now numerous schools on European lines to the number of about 200, with some 15,000 pupils of both sexes. A ministry of education and an educational council have been created to supervise and co-ordinate public instruction. The government maintains numerous colleges where some scientific knowledge may be gained besides Persian and Arabic literature. Since 1849 there has been a polytechnic school in Teheran equipped with European instructors, to which four French professors were added a few years ago. Military colleges exist in the capital and Tabriz, and a German school, partially subsidized by

German funds, was opened in 1907. The Alliance Française supports a French school. A political college or civil service institution trains pupils for diplomatic and foreign office service.

Political Divisions.—Persia is divided into 33 provinces of very unequal size, the principal ones being, in the north, Astrabad, 10,000 square miles, pop. 250,000; Mazandaran, 8,000 square miles, pop. 500,000; Ghilan, 6,000 square miles, pop. 600,000; Azairbijan, 35,000 square miles, pop. 1,700,000; in the west, Irak-Ajemi, 115,000 square miles, pop. 1,800,000; Ardelan, 6,000 square miles, pop. 200,000; Khuzistan, 30,000 square miles, pop. 800,000; Luristan, 30,000 square miles, pop. 400,000; Farristan, 60,000 square miles, pop. 1,500,000; in the south, Kerman, with Kohistan, Makran and Seistan, 150,000 square miles, pop. 820,000; and in the east, Khorasan, 140,000 square miles, pop. 960,000; Kermanshah, pop. 425,000. Though three times the size of France, where the population is 190 to the square mile, that of Persia is slightly less than 15 to the square mile.

Government.—Until 5 Aug. 1906 the Shah was an absolute autocrat. On that day the then reigning Shah, Muzaffar-ed-Din, issued a decree convoking a Mejliss or national assembly, and a constitution, dated 1 Jan. 1907, was confirmed on 11 Feb. 1907 by his successor, Mohammed Ali. In October of the same year a new constitution limited the ruler's prerogatives and ecclesiastical authority, granted liberty of conscience, of the person, education, speech, press and associations and defined the responsibility of ministers and the duties of Parliament. The Shah violated and abolished the constitution in November 1908. Yielding to diplomatic pressure by Great Britain and Russia, he granted another constitution and electoral law in June 1909. By this law, under which the elections were held shortly after the Shah's deposal in July, the Mejliss consists of 120 deputies, 40 forming a quorum. The Mejliss was dissolved in December 1911, and did not meet again until 1915. (See *History*). The provinces are governed by governors-general directly responsible to the central government, with power to nominate their subordinate lieutenant-governors. The towns have mayors or chief magistrates, while every parish of a town has its local chief. The nomad tribes also have their chieftains, who are responsible for the collection of taxes among their people. Practically all male subjects are entitled to vote in municipal elections.

Justice.—The administration of justice is vested in the provincial governors, the Sheikh-ul-Islâm and the Mohammedan priesthood, which produces a conflicting code based upon a mixture of unwritten common law and divine law according to the Koran. Bribery, corruption and perjury are the rule rather than the exception in legal procedure, while the criminal code is somewhat barbaric. Appeal does not exist.

Army.—The army is Oriental in character and, consequently, extremely loose in organization and defective in equipment. Various European officers—principally Russian—have attempted to instil Western discipline into the army, with but poor results. Troops are recruited from districts according to certain prescribed quota. Christians and Jews are exempt

on payment of a tax. The regular and irregular troops are probably about 110,000 in number. A Cossack brigade, composed of Persians drilled by Russian officers, is stationed at Teheran, while the Russian government until recently maintained a similar body at Tabriz. In September 1915, owing to lack of payment, a Gendarmerie force of 7,000 men officered by Swedes was disbanded. In several of the large cities the police are commanded by Swedish officers. The navy is insignificant; the half-dozen small vessels composing it being engaged by the customs department.

Agriculture and Industry.—Though the Persian is by nature more adapted to trade than agriculture, the bulk of the people are perforce engaged in cultivating the soil. From the fertile regions come rice, wheat, barley, fruit, dates, drugs, gums, silk, wool and cotton. Persian carpets and rugs, made by the peasantry in wretched hovels, are celebrated throughout the world, attracting fancy prices enormously in excess of their cost of production. Opium, pearls, precious stones and skins are exported. The lack of internal transit and manufactories compels the Persians to import many items which, under more favorable conditions, their own country could produce. The greatest trade before the war was with Russia; the British Empire came second, Turkey third and Germany fourth. The principal ports are Bushire, Bandar Abbas, Mohammerah and Lingah. In the year before the war broke out, German shipping entered amounted to nearly 2,000,000 tons and little over 1,500,000 tons of British shipping.

Internal Communications.—Persia has only six miles of railroad, running from Teheran to Shah Abdul Azim, run by a Belgian company. The British government subsidizes a British firm of Bagdad to run a fortnightly steamer up the Karun River. The only highways that existed in Persia at the beginning of this century were two roads with a total length of about 300 miles. A number of new roads have been opened since then and others are under construction. The two methods of travel and transport are still the primitive cart—drawn by mules or oxen—and the camel. A regular postal system has been in operation since 1877. There is a weekly service to India via Bushire and another twice a week to and from Europe via Resht or Tabriz and Tiflis. Since 1906 the post office has been united with the customs department and is mainly operated by Belgians. A ministry of posts and telegraphs was created in 1909. About half the telegraph wires in Persia are operated by an English staff, while the Persian government operates its private system by its own staff. Direct telegraphic communication with India was established in 1904.

History.—When one regards modern Persia, steeped in poverty, torn by factions, deluded by political visionaries, infested with brigands, squeezed between foreign powers, even partitioned into spheres of influence, and at the most a big desert surrounded by rocky mountains, "a land where no water is," one is apt to forget that it once meant an empire which stretched from the Indus to the Danube, from the Oxus to the Nile, and that on the shore of the Narrows in the Dardanelles a "Great King" once sat on a marble throne at

Abydos and poured a libation from a gold cup into the Hellespont as the Persian "Immortals" led the way across the bridge of boats to the conquest of Athens. Though the beginnings of Persian history are wrapped in legendary mist, we know that the ancient Persians were Aryans or Indo-Iranians, but at what period they migrated from the East to the plains of Iran cannot be determined, though existing records at least prove that it was prior to 1400 B.C. Some authorities hold that the migration extended over thousands of years, beginning from about 2000 or 2500 B.C. Tradition relates that the Iranians were compelled to forsake their home country, Aryanem-Vaejo, on account of its cold climate. Where that country was located is uncertain. It is generally accepted that the Medes entered Persia from the northwest and settled along the western side of the plateau. The Iranians came from the northeast through Bactria, now known as Balkh, in northern Afghanistan, penetrated somewhere into the northern part of Khorasan, and wandered southward through Kerman to the Persian Gulf. Other migrations followed: Some turned southeast and crossed the Hindu Kush; the Hyrcanians settled on the Caspian coast about Astrabad; the Carmanians (whence the name Kerman) settled in western Persia, while other invaders poured into Afghanistan and Baluchistan, where they made their homes. The Iranians appear to have been the first branch of the Aryan group to adopt civilization and to practise monotheism. They also introduced the horse into western Asia, where it was previously unknown. Before Persia proper came into being there were two Iranian empires side by side on the plateau—those of the Medes and the Persians. We read of Shalmaneser II, king of Assyria, battling with the Medes in 836 B.C., and Sargon exacting tribute from Median princes bearing unmistakably Persian names. About the 7th or 6th century B.C. Zoroaster, a native of Media, developed the religion of fire-worship which still bears his name. In the region which is now included in the Persian provinces of Arabistan, Luristan, Pusht-i-Koh and the Bakhtiari Mountains, due east of Babylon, Basrah and Bagdad, there lay the kingdom of Elam bordering on ancient Sumer and Akkad, more ancient by far than the Median or Persian communities, and over which King Chedorlaomer, mentioned in Genesis (xiv, 9), ruled in Susa—the Shushan of the Bible. "Elam" is the biblical name for Persia. The earliest example of a letter recovered from the ruins of Babylon relates to Elam, and the date ascribed to this document is about 2850 B.C. The aborigines of Elam supposedly were negritos of non-African type, by whom the whole plateau was perhaps at one time inhabited. The influx of Turanian and later of Semitic elements in time absorbed the native stock and modified the language. Various other tribes, Mesopotamian and Iranian, made up the population of Elam. For centuries Elam led a predatory existence, raiding Babylon and Assyria until the latter, under Assurbanipal (668-626 B.C.), entirely destroyed the kingdom in 645 B.C. (Ezekiel, xxxii, 24). Its territory included or adjoined the principality of Anshan or Anzan, over which reigned the first great Aryan recorded in history—Cyrus. In 550 B.C. Cyrus defeated Astyages the Median

king, to whom he was related, captured the royal city of Ecbatana and united the two Iranian states under the name of Persia. About 100 years earlier the Medes had thrown off the yoke of Assyria, hence their independence had lasted approximately a century. Cyrus now led his armies into Asia Minor, conquered and captured Croesus, the king of Lydia, and annexed all the Greek colonies in those regions. The Phrygians, Mysians and other Asiatic tribes submitted to him. For the next five or six years Cyrus was engaged on his eastern borders, either warring against unruly neighbors or preparing his army for the great task he had in view—the capture of Babylon. He certainly subdued greater part of what is now Afghanistan in the meantime. Babylon under Nabonidus was in turmoil; the captive Jews and many other exiles had been encouraged by their prophets and leaders to expect the fall of the city. Cyrus advanced with his host, easily defeated the Babylonian army and entered the city without opposition; mighty Babylon surrendered without a blow to the Persians in 538 B.C.

Until the discovery, within recent years, of the Nabonidus and the Cyrus cylinders, our knowledge of the fall of Babylon was based upon the dramatic story of Herodotus and the book of Daniel. The former is proved to be merely a legend and the latter devoid of historical value. There was no siege of Babylon by Cyrus; the Belshazzar (q.v.) who was killed by Gobryas (the father-in-law of Darius) at the surrender of Babylon was neither the son of Nebuchadnezzar nor king of Babylon.

Cyrus displayed remarkable generosity toward the Jews; he permitted them to return to Jerusalem and restored the gold and silver vessels of the sanctuary. His dominions now included Elam, and, outside of Persia, the Greek colonies Lydia, Babylon and Phoenicia; there yet remained Egypt. He began preparations for the conquest of that country, but died before he could carry out his plans. During his reign of nearly 20 years Cyrus raised Persia to the chief position in Asia by his victories, diplomatic skill and magnanimous character. He fell in battle against Turanians, Tartars or Parthians (accounts differ on this point) in 529 B.C. The circumstantial story of Herodotus connecting the death of Cyrus with the Massagetae is a legend. Cyrus was succeeded by his son Cambyses, who accomplished the conquest of Egypt in 525 B.C., thereby adding a great province to the Persian Empire. A cruel tyrant, Cambyses had not the ability of his father; he caused his brother Smerdis (Bardiya) to be murdered secretly, and when he himself died by suicide in 522 there was no heir to the throne. A revolt fomented by the Median tribe of Magians resulted in one of their number, Gomates, impersonating Smerdis and seizing the royal crown. He ruled for a year before the imposture was discovered, when Darius, son of Hystaspes, a descendant of the second or Persian line of the Achaemenian princes (Cyrus belonged to the Anshan line), with six other Persian nobles, killed the usurper and all his followers. Darius became king in 521 B.C. and proved himself a born leader of men, a great general and a skilful ruler. He extended his dominions eastward to the Indus and attempted to force a way into Russia, but here the climate

defeated him as it did Napoleon over 2,000 years later. The spirit of revolt was abroad in the land. The Greek cities of Cyrene and Barca had submitted to Cambyses. Greek patriotism became inflamed; revolutions broke out in Babylonia and Elam; the governors of other provinces saw opportunities of creating kingdoms for themselves. Darius led his army against Babylon and reduced the city after a two years' siege in 519 B.C., after which he turned against the individual rebels. He quickly overcame all opposition and peace reigned throughout the empire in 518. He divided his realms into satrapies and appointed inspectors with plenary powers to investigate the conduct of administrators. He coined the first Persian money; revenue was raised on a system of assessments and collected in money or kind according to the products of the various districts. Roads were constructed and a great army of levies and regulars was maintained. In 512 B.C. Darius led an expedition into southern Russia against the Scythians, who kept out of his way. On his return journey he reduced the rebellion in Thrace and received the submission of Macedonia. One of his generals, Otanes, compelled the surrender of Byzantium (Constantinople) and burnt it down. A later expedition to India brought the Panjab and Sind (Scinde) under Persian dominion. Persia had reached the zenith of her glory; tranquility and order were enforced by "the law of the Medes and Persians which altereth not." In 499 B.C. the Ionic revolt broke out and led to the Persian invasion of Hellas. Darius suppressed the Ionian Greeks and dispatched a punitive expedition against Athens and Eretria. It failed in its purpose; a second expedition was more successful. It totally destroyed Eretria and sailed for Marathon, 24 miles northeast of Athens, where some 9,000 Greeks charged into a host of 40,000 to 50,000 Persians and routed them, 490 B.C. Darius I died in 485 B.C. and was succeeded by Xerxes, supposed to be the Ahasuerus "which reigned from India even unto Ethiopia, over an hundred and seven and twenty provinces" (Esther i, 1). His first task was to crush the Egyptian revolt which had broken out in 486. Three years later Babylon rose in arms. Xerxes besieged the city, took it in a few months and delivered it over to be plundered. From this blow Babylon never recovered—her glory faded and the wonder of the Old World sank slowly into oblivion. To redeem the disgrace of Marathon preparations on a vast scale had long been in the making for the conquest of Hellas. Troops were collected from every part of the empire—Persians, Medes, Hyrcanians, Cissians, Assyrians, Arians, Bactrians, Parthians, Sakae, Indians and Ethiopians; infantry, cavalry, archers and spearmen, chariots and Arabs mounted on camels. The Phœnicians supplied 1,200 warships with crews; 3,000 transports were ready to convey the greatest and most picturesque agglomeration the world had hitherto witnessed. Herodotus relates that there were 1,700,000 infantry, 100,000 mounted men, and 510,000 sailors and marines, a total of 2,310,000, though this is considered to be an exaggeration. In the spring of 480 B.C. this huge machine was set in motion. While it moved across two pontoons bridging the Hellespont near the modern Chanak Kalesi, Xerxes poured a libation into the water praying

that he might conquer Europe. The Greeks feverishly prepared to meet the approaching avalanche advancing unopposed through Thessaly and Macedonia. With the honorable exceptions of Plataea and Thespiæ, most of the Greek states of northern and central Hellas submitted without resistance before the first battle was fought. The fate of that expedition is known to every schoolboy: the heroic defense of the pass of Thermopylae by Leonidas and his immortal Three Hundred; the naval battles off Artemisium; the evacuation of Athens to be ravaged by the invaders and the last stand of the Greeks at Salamis, risking all upon a single battle with the result that the Persians suffered a crushing defeat. The Greek victory at Plataea (479) settled for centuries the question as to whether Asia should conquer Europe. Famine and disease completed the work of the Greeks upon the Persian host; King Xerxes fled back to the safe shores of Asia; and Athens began to take her position as the intellectual and artistic leader of the world. The Lacedæmonians under Pausanias took Byzantium from the Persians. Xerxes was murdered by two of his courtiers in 466 B.C. and Persia fell into the hands of incompetent rulers. Despite the magnitude of defeat and loss of prestige, the empire continued to play the leading rôle on the world's stage for another century and a half.

Artaxerxes I (third son of Xerxes) succeeded to the throne as a mere boy. He ruled for 40 years and proved utterly incapable. A second revolt broke out in Egypt (460 B.C.) and the Athenians joined in the struggle against Persia. They sent a fleet to Egypt and defeated the Persians under Achæmenes at Papremis in the Nile Delta and captured Memphis all but the fortress. A Persian army of 300,000 men supported by 300 Phœnician ships appeared on the scene in 456 B.C. and relieved the garrison; the Egyptians and Greeks were defeated and the rebellion collapsed. In 449 B.C. the Greeks came to an agreement with Persia by the Peace of Callias and years of comparative peace followed. Artaxerxes died in 425 B.C. His son, Xerxes II, was quickly murdered when drunk by his brother Secudianus, and another brother, Ochus, became king under the title of Darius II. He was an inhumanly cruel brute; his wife, Parysatis, is said to have surpassed him in bloodthirsty temperament. He reigned about 20 years, a period of anarchy, insurrection and degrading villainy at the royal court. Persian military efficiency began to weaken, sapped by excessive prosperity and the king's evil example. Large numbers of Greek mercenaries were enrolled into the army and navy and entrusted with high commands. What had been conquered by the sword was maintained by intrigue and bribery; wealth and luxury began to undermine national strength and spirit. Darius II died in 404 B.C. and was succeeded by his son, Artaxerxes II (Mnemon), despite the efforts of Parysatis to substitute her younger son, Cyrus, who was to become the hero of one of the most remarkable adventures in history. This Cyrus the Younger, described by Xenophon as "a man, of all the Persians who existed after the ancient Cyrus, the most kingly and worthy to command," left his satrapy in Asia Minor and marched against his brother the king with a composite force of

13,000 Greeks (commanded by Greek officers) and 10,000 Asiatics. The expedition encountered the Persians under Artaxerxes at Cunaxa near Babylon. In the ensuing battle (401 B.C.) the Greeks were victors although their cause was lost; but Cyrus was defeated and slain. The event is vividly related with some exaggeration by Xenophon the Greek historian (q.v.), who accompanied the expedition. After Cunaxa a league was formed between Persia, Athens, Thebes, Corinth and Argos against Sparta, whose fleet was defeated at Cnidus in 394. The long walls of Athens were rebuilt with Persian money, and Sparta was compelled to sign the humiliating Peace of Antalcidas (387 B.C.), so named after the Spartan ambassador. By this peace Persia recovered her lost possessions in Asia Minor. Egypt again rose in defiance under Nectanebo, and Artaxerxes dispatched a powerful expedition in 374 B.C., which had to retire from the Nile without accomplishing its object. After an eventful reign of 46 years Artaxerxes died at the age of 94 in 358. A weak and benevolent ruler, he revived the worship of Mithras. He was succeeded by his son Ochus as Artaxerxes III, in whom exceptional ability was disguised by an incredible ferocity. He began his reign by murdering nearly all the members—male and female—of his family. He almost succeeded in restoring Persia to her former greatness by crushing every revolt with the utmost brutality. In his campaign against Tennes, king of Sidon, he ordered the massacre of 500 representatives of the people, whereupon the townsmen set fire to their own city and immolated themselves with their families. Ochus crushed the revolt in Egypt, killed the sacred bull Apis and had it served at a banquet; he destroyed cities, murdered thousands of citizens and despoiled their temples. Ochus was in his turn murdered by his capable minister, the eunuch Bagoas, as a means of self-preservation. Most of the king's sons were also put out of the way, and Bagoas placed the youngest, Arses, on the throne (338 B.C.). The eunuch soon found it advisable to murder Arses and selected in 336 B.C. a certain Codomannus as King Darius III, believed to have been a scion of the Achæmenian line, which died out with him. As a safeguard against sharing the fate of his two immediate predecessors, Darius took the precaution of killing Bagoas.

In the same year that Darius III ascended the throne of Persia, the poor and comparatively small kingdom of Macedon in Europe crowned its new king, the great Alexander, a pupil of Aristotle and a military commander at the age of 16. Up to this time Persian armies had carried war into Europe; the turn of the tide was at hand. In 334 B.C. Alexander, then 22 years old, set out to realize the great scheme originated by his father—the conquest of Asia. He led his army of 30,000 infantry and 5,000 cavalry across the Hellespont, defeated the Persians on the Granicus, captured Sardes, Ephesus, Miletus, Halicarnassus and several cities of Lycia and Pamphylia. Turning inland, he crossed through Asia Minor and met the Persian armies of over 500,000 on a plain near the city of Issus. Here, in November 333 B.C., was fought one of the great decisive battles in history. The Persians were put to flight with terrific slaughter. King Darius fled,

leaving his camp and his family in the hands of the victors. During 332–331 B.C. Alexander captured Tyre and annexed Egypt. Crossing the Euphrates and the Tigris he found Darius awaiting him with an army about 1,000,000 strong at Gaugamela, near the ruins of Nineveh, about 70 miles northwest of Arbela. With only 40,000 infantry and 7,000 cavalry Alexander bore down upon the enemy, broke through his ranks and scattered all before. Darius fled early during the battle, pursued by the Macedonians. After the battle of Arbela (331 B.C.) Alexander was received in triumph in Babylon, whose people welcomed him as their savior. Three weeks later he entered Susa, the capital of Elam; Persepolis, Pasargadae and Ecbatana fell into his hands. A party sent in pursuit of Darius found his body in a wagon, murdered by order of Bessus, viceroy of Bactria (330 B.C.). Bessus was crucified two years later. The death of Darius ended the Achæmenian dynasty after an existence of 320 years, and Persia became a part of the Macedonian Empire, the annexation being completed by the capture of Balkh in 328 B.C.

Alexander the Great took steps to pacify and consolidate the empire he had won; he mixed Persian soldiers with his own troops and ordered his men and officers to marry the women of the country. He himself married Roxana, the beautiful daughter of the Bactrian chief, Oxyartes, and also, later, Statira, a daughter of Darius. He then began the invasion of India in 327 B.C., a task he did not live to accomplish; a spirit of mutiny and war-weariness among his soldiers ended the Indian campaign in 326 B.C. The sudden death of Alexander at Babylon in 323 B.C. gave the signal for a fierce strife among the generals and satraps for the possession of the empire. Out of the turmoil of civil war one of Alexander's generals, Seleucus Nicator, seized Babylon and founded the Seleucid dynasty. He conquered Susiana, Media and the eastern provinces of Alexander's empire to the Oxus and Indus. Some nomad tribes from north of the river Atrek settled in Parthia (q.v.), the modern Khorasan where Arsaces I founded the dynasty of the Arsacidae. Of this family, Mithridates the Great (171–138 B.C.), overthrew the Seleucidae and extended his dominions from the Indus to the Euphrates. His successors ruled over Persia till the revolt of 226 A.D., which brought about the downfall of Parthia and the rise of a new Persian dynasty.

The Sasanian Period.—For over 500 years after the death of Alexander Persia was involved in an ever-changing kaleidoscope of wars, conquests, alliances and revolts, embracing Mesopotamia, India, Rome, Greece, Armenia and the Alani. Under Artaxerxes I (known as Ardeshir) the independent kingdom of Persia was restored after the battle of Hormuz in 226 A.D. and a new brilliant dawned for Iran. From this period, also, dates the beginnings of reliable Persian chronicles unencumbered with legendary embroidery. Ardeshir conquered Armenia, Kerman, Susiana, Media and the greater part of the Iranian highlands. He also revived the neglected religion of Zoroaster and ruled with justice and wisdom. He was succeeded by his son Shapur I in 240 or 241, who led an expedition into Roman territory and captured the Emperor Valerian. But he was later

defeated by Odoenathus, husband of the famous Zenobia of Palmyra (q.v.). Shapur founded the city of Nishapur, the birthplace of Omar Khayyam. It was in his reign that the sect known as Manichæans arose, whose leader, Mani, preached a kind of "Christianized Zoroastrianism." Hormisdas, son of Shapur, reigned only a year and was followed by Bahram I, who, according to Alberuni, "killed Mani, stripped off his skin, filled it with grass and hung it up at the gate of Gundisapur." Bahram ruled from 272 to 275 A.D. Bahram II (275-282) began as a tyrant, but reformed when threatened with murder; the third Bahram reigned four months and was followed by Narses, who provoked a quarrel with Rome by invading Mesopotamia. At first successful, he was finally defeated by the Romans who captured his wives and children and compelled him to cede much of his territory. He abdicated in 301 and was succeeded by Hormisdas II, who died in 309. The natural heir of the latter was refused the throne and a posthumous son was elected king even before he was born. The expected heir arrived a few months after his father's death and became the famous Shapur the Great. As he died in 379 he was actually king for 70 years, though he did not assume power till he attained his 16th year. He began war against Rome in 337 to regain the lost territory, and in 338 invaded Mesopotamia. With varying defeats and victories the war dragged on for 15 years, to about 352 and was recommenced in 359, ending in 361. Rome and Persia came to grips again in 363. The Emperor Julian fell in battle and his successor Jovian returned to Persia the five provinces ceded by Narses. Under Constantine Christianity had become the official religion of the Roman Empire, a circumstance which led to the barbarous persecution of Christians in Persia under Shapur. That monarch, however, left his country at the height of her glory and power. His successors call for little notice. Ardeshir II (379-383), weak, old and benevolent, was deposed; Shapur III (383-388) made peace with Rome and received a large portion of Armenia. Assassination ended his career, and Bahram IV (388-399) became king. He was killed by his own soldiers. Yezdigird the Wicked (399-420) distinguished himself by his barbarity toward the Christians; Bahram V (420-440), the "great hunter" of Omar Khayyam, is the hero of Persian fable. He continued the Christian persecution; after a short war with Rome, in which he suffered defeat, a mutual agreement was made by which religious liberty was granted to Zoroastrians under Rome and Christians in Persia. In his reign the Eastern Church declared its independence of the Western Church (424). About this time a Chinese tribe known in history as the White Huns crossed the Oxus and ravaged Persian territory. Bahram fell upon these invaders and inflicted a crushing defeat. Yezdigird II (440-457) waged war against Rome and attempted to reconvert the Christians of Armenia by massacre. He persecuted both Christians and Jews, married his own daughter and then murdered her. Hormisdas III (457-459) was overthrown by his brother Perozes (Firuz) with the assistance of the White Huns, against whom he had to fight for the rest of his life. He fell in battle in 483 and Persia became tributary to

the White Huns. His successor, Volagases (Balas), was blinded and died in 487. The next ruler, Kobad or Kavâdh, was converted to a communistic creed propounded by Mazdak of Persepolis; the king was put in prison by the nobles and replaced by his brother Zamasp. He escaped in 1501, fled to the White Huns and regained his throne. He broke the 60 years' peace with Rome, ravaged Armenia and captured the fortress of Amida. For the next 10 years he fought against the White Huns and broke their power for ever. Roman aggression led to another war in 524, resulting in defeat for the Persians at the hands of Belisarius (q.v.). Kobad was succeeded in 531 by his son Khosru I (Chosroes) the Just, the most distinguished member of the Sasanian dynasty. He caused the execution of Mazdak and many thousands of his followers. He made a treaty of perpetual alliance with Rome in 533 which he broke in 540, when he led an invasion of Syria, capturing and plundering the rich cities and razing Antioch to the ground. Khosru forced Justinian to pay tribute; he expelled the Abyssinians from Yemen, invaded the White Hun country and thereby recovered Balkh, and attacked the wild Khazars, whom he slew in thousands. In addition to his military ability Khosru possessed the virtues of toleration, generosity and a strong sense of justice. A patron of art, literature, education and science, he organized the state to a high degree of efficiency. Under his reign the so-called "Nestorian" church flourished in Persia. Hormisdas IV (579-590), son of Khosru by a Turkish princess, continued the war with Rome and defeated the Turks. His tyranny and offensive conduct led to his assassination. Khosru II, Parvis (590-629) was immediately attacked by Bahram Chubin, a demoted general, who seized the throne. But the nobles opposed the usurper; with the aid of a Roman army the allies of the legitimate heir crushed Bahram in 591 and restored Khosru to power. The latter declared war on Byzantium in 603 to avenge the murder of his friend, the Emperor Maurice. Persian arms achieved a long series of victories in Mesopotamia and Asia Minor; cities and fortresses fell before them: Dara (605), Edessa, Harran, Hieropolis and Aleppo. Aided by 26,000 Jews the Persians captured and sacked Jerusalem in 614; three years later they took Chalcedon and stood in sight of Constantinople. Alexandria fell in 616 and the Nile Valley, after an interval of nearly 1,000 years, was again in Persian hands. The Emperor Heraclius stemmed the tide at Issus in 622, reconquered all the lost territory and carried the war into Persia. Khosru II was deposed and murdered in 628. Kobad II followed (628); he made peace with Heraclius and returned the True Cross to Jerusalem which his father had carried away. In the following year he murdered his brothers and died of the plague. His son, a boy of eight, was murdered in 630 and a period of anarchy ensued. Eleven rulers — among them two queens — followed in rapid sequence until the accession of Yezdigird III in 634. The last king of the Sasanian dynasty, he was murdered in 652. During his reign the Arabs, galvanized by the new faith of Islam, overran Persia and battered down a desperate resistance that lasted 10 years. Except in Yezd and Kerman the creed of Zoroaster was stamped out; Islam was forced

upon the vanquished and Persia became a part of the caliphate. The star of Persia had set. After the fall of the Sasanians the country was ruled by despots who were celebrated only for cruelty and incompetence. From the disastrous battle of Nahavand in 642, at which over 100,000 Persians and allies were slain, there followed eight centuries of alien rule, civil wars and invasions. In the 9th century Persia was broken up into petty states; the Turkish Seljuk dynasty later dominated several provinces; the terrible Mongol hordes of Chengiz Khan desolated the country in the 13th century; the grandson of this distinguished savage, Hulagu Khan, killed the last caliph and made himself king. He and his successors governed wisely and tolerated all religions until the arrival of Timur the Lame (Tamerlane) in 1387 with his Tartar hordes. Timur conquered Persia and filled Asia with terror. After his death in 1405 the Mongol dominion collapsed to be superseded by that of the Turkomans for the next 100 years. The Sufi dynasty (1501-1736) brought about that division of Mohammedanism which was vitally momentous to the Islamic world. The new sect (Shia) rejected the infallibility of human wisdom and discarded the Sunni doctrine hitherto the standard of Mohammedan countries. To this day the Shah must belong to the Shia faith. The Sufi dynasty was a national one, descended from the Sasanians. In 1722 the Afghans under Mahmud invaded Persia, settled themselves in Ispahan and captured the Shah.

Taking advantage of the situation, Russia and Turkey deprived Persia of her richest and most important northern provinces. Mahmud, meanwhile, was drenching Ispahan with the blood of her people; at one time 300 Persian nobles were invited to a banquet and murdered; Mahmud had his 3,000 Persian guards butchered, after which an indiscriminate massacre lasting 15 days almost depopulated the royal city. The tyrant himself took a hand in exterminating 39 members of the Sufi dynasty. He died in 1725 and was succeeded by the Afghan Ashraf. Two years later the fugitive Shah, Husayn, was joined by Nadir Kuli, a famous brigand who was destined to become the greatest conqueror of his age. He not only drove the Afghans out but killed the old Shah and his heirs and became Shah himself in 1736. (See NADIR SHAH). After his assassination in 1747 there was a period of over 40 years largely filled with anarchy and the struggles of rival princes. But for 19 years Karim Khan ruled with the title of *wakil* or regent over the whole of Persia except Khurasan.

Modern Persia.—*The Kajar Dynasty*, of Turkish origin, was founded by Agha Mohammed, a eunuch, one of the most cruel and vindictive monarchs that ever disgraced a throne. Upon his conquest of the greater part of Persia in 1794, he ordered a general massacre; 20,000 women and children were sold into slavery and numberless other atrocities followed. He ordered 70,000 eyes of the inhabitants of Kerman brought to him on a platter, and on receiving them he counted them, touching each with the point of his dagger, then turning to his minister he said: "If one had been wanting I would have made up the number with your own eyes." After a reign of 18 years he was fortunately murdered by his own

attendants in 1797. He was succeeded by his nephew, Fath Ali Shah, under whose sanction many acts of cruelty and injustice were committed. He was followed on the throne by his son in 1834. The reign of Mohammed Shah was marked by difficulties with the British government; by the rebellion of Agha Khan Mahlati—"The Chief of Assassins"; by a new rupture with Turkey and the rise of the sect of the Babis, who afterward led an insurrection. Mohammed died in 1848 and was succeeded by his son Nasir-u-Din Mirza. It was during the reign of Fath Ali Shah that official relations began with England and British India. Mahdi Ali Khan was entrusted by the governor of Bombay with a letter to the Shah. He was soon followed by an English envoy from the governor-general, Captain Malcolm of the Madras army. The results were a political and commercial treaty and a return mission to India from Fath Ali Shah. In 1887 Sir Henry Drummond Wolff was appointed as the British Minister to Persia, Nasir-u-Din seemed to lend a willing ear to his advocacy of the development of commerce, the construction of roads and the abolition of various restrictions upon Persian merchants. In 1888 the Shah issued a proclamation assuring safety of life and property to all his subjects, and soon afterward declared the Karun River open to international navigation up to Ahwaz. In the same year the first railway in Persia was opened. In 1873 Baron Julius de Reuter had become the owner of a concession for the organization of a Persian state bank, with exclusive rights for the issuing of banknotes and also for the working of Persian mines. Russia then demanded what she considered a corresponding advantage but it was not until February of 1898 that Prince Dolgorouki, the Russian Minister, obtained from the Shah a document which gave to Russia the refusal of any railway concession in the country for five years.
